Mr. Wheadon, gardener to R. S. Collier, Esq., Hawthorns, Bickley, secured the leading prize for twenty-four Japanese varieties, staging well finished blooms. The best of these were W. H. Lincoln, Beauty of Exmouth, Viviand Morel, J. Shrimpton, F. W. Flight, Mdlle. Marie Hoste, and W. Tricker. Mr. A. Tomalin, gardener to S. Whyte, Esq., Crayford, was second, and Mr. Leadbetter followed. There were four competitors in this class, and the competition was keen. Mr. Wheadon repeated his success in the class for twelve Japanese varieties with a stand of fine blooms, comprising the leading varieties. Mr. Thos. Osman, The Gardens, Ottershaw Park, Chertsey, was second, the third prize going to Mr. A. Tomalin. There was only one competitor in the class for twelve incurved blooms, this being Mr. J. Lyne, gardener to F. Tiarks, Esq., Foxbury, Chislehurst, to whom the first prize was awarded. Mr. Leadbetter secured the leading award for twelve reflexed blooms, staging fine examples; Mr. T. Couldrey, gardener to J. Levy, Esq., The Shrubbery, Grove Park, being second. Anemone-flowered Chrysanthemums were best shown by Messrs. Leadbetter and Lyne, and A. Tomalin, to whom the prizes were awarded as their names are given. Messrs. A. Tomalin and J. Lyne also won the prizes for twelve bunches of Pompons. Mr. Osman gained the first prize for six Japanese, one variety only, with grand blooms of Sunflower. Mr. P. Waterer was second with E. Molyneux, and Mr. Rhoden, Blackheath Park, third with Stanstead Surprise. Mr. W. Ames, South Ashford, was first with six incurved blooms, showing small but neat examples of Mrs. G. Rundle.

Amateur growers were well represented, and the same may be said of gardeners who resided within a radius of three miles of the Rink. Mr. J. Rhoden in the latter instance was placed first for six incurved blooms, which were neat in appearance. Mr. T. Couldrey was second, and Mr. Wainwright, Lee, third. The prizes for six Japanese went to Messrs. J. Rhoden, T. Couldrey, and C. Bayer, Forest Hill. Dr. Walker, Wimbledon, was placed first in the amateurs' section for twelve incurved blooms, showing neat examples of Violet Tomlin, Princess of Wales, and Madame Darrier amongst others. Mr. A. J. Parker, 172, New Kent Road, was second. Dr. Walker was also successful in gaining the first prize for twelve Japanese, showing a stand of fine blooms of the leading varieties. Mr. A. J. Parker was second, and Mr. W. Ames third. For six Japanese blooms Messrs. Rose, G. Saunders, and A. J. Parker won; and for the same number of incurves Dr. Walker, A. J. Parker, and W. Ames secured the prizes in order given. Mr. Saunders had the best six blooms of one Japanese variety, Mrs. F. Jameson, and Mr. W. Ames was second with Avalanche. Mr. Bertenshaw, East Dulwich, was first for twelve Japanese blooms in this section, the second prize going to Mr. H. W. Percy, Fairmont, Brockley. In other amateur classes blooms were well shown.

For the President's special prize for eight Japanese and eight incurved blooms there were three competitors, these being Mr. A. Tomalin, C. Payne, and Leadbetter, to whom the prizes were awarded as their names appear. The competition was keen, fine blooms being staged in each class. Mr. T. Osman had the best six blooms of Avalanche, the second going to Mr. J. Lyne, who also secured the first award for six blooms of Mdlle. Lacroix family. Mr. Percy won with six blooms of the Rundle family, and Mr. A. Tomalin had the best twelve flowers of the same section. Mr. Filkins, Oakbank, Chislehurst, staged the best single bloom of W. Seward, a fine specimen.

The premier Japanese bloom in the Show was a splendid flower of E. Molyneux, shown by Mr. H. Shoesmith. Mr. Leadbetter had the best incurved variety, this being a beautiful bloom of Prince Alfred.

Groups of plants formed a feature in the Exhibition. For one

Groups of plants formed a feature in the Exhibition. For one composed principally of Chrysanthemums, Mr. Rhoden, The Gardens, Blackheath Park, was placed first; Mr. F. Fox, gardener to Mrs. Penn, The Cedars, Lee, was second; and Mr. J. Williams, College Park, Lewisham, third. There were twenty-four competitors in this class.

Miscellaneous exhibits were plentiful. Messrs. B. S. Williams and Son, Upper Holloway, arranged a group of foliage plants and Orchids, and Messrs. E. D. Shuttleworth & Co., Peckham Rye, sent a collection of Ferns, Crotons, Palms, and Heaths. Mr. W. Wells, Earlswood, had some Chrysanthemum blooms, as likewise did Mr. R. Owen, Maidenhead. Messrs. J. Laing & Sons, Forest Hill, S.E., contributed a splendid group of stove and greenhouse plants. Messrs. A. Tomalin, J. Lyme, and Filkin, had groups of flowering and foliage plants in the competitive classes. Primulas and table plants were well shown. Baskets and bouquets of Chrysanthemums were exhibited by ladies.

Fruit formed an interesting feature in the show. Messrs. G. Bunyard & Co., Maidstone, sent a very fine collection of Apples and Pears in splendid condition. Grapes, Apples, and Pears were exhibited in the competitive classes provided for fruit, but pressure on our spaces

prevents further reference.

ASCOT .- NOVEMBER 1ST AND 2ND.

THE annual autumn Show in connection with the Ascot and District Horticultural Society was opened on Wednesday last, when a grand display of plants, flowers, and fruit was staged. Groups of Chrysanthemums and also of miscellaneous plants were of exceptional merit, the eompetition in the various classes being kecn. The incurved blooms were not, perhaps, quite up to the usual high standard, the Japanese on the other hand being better than is customary. The exhibits of vegetables and fruit were numerous and fine, but space will not permit of our referring to them at length. The same may be said of plants, of which Primulas, Bouvardias, and Violets were prominent. We append

a list of the prizewinners in the principal classes devoted to Chrysanthemums.

In the class for forty-eight, to include not less than eighteen Japanese and eighteen incurved blooms, Mr. Thorne, gardener to Major Joicey, Sunningdale Park, was a good first. The flowers staged were grand, especially the Japanese. The exhibit comprised W. Tricker, E. Molyneux, W. H. Lincoln, G. C. Schwabe, Viviand Morel, Colonel W. B. Smith, Lord Wolseley, Queen of England, Prince Alfred, Mrs. Heale, Camille Flammarion, Queen of England, Madame F. Mistral, and Lord Wolseley, back row; Mrs. Heale, Madame Darrier, Miss M. A. Haggis, Jeanne d'Arc, Violet Tomlin, Madame Darrier, Madame Mistral, John Lambert, J. Shrimpton, Majestic, Viviand Morel, Mons. E. A. Carrier, Excelsior, Mrs. G. Herring, Count F. Lurani, and Mdlle. Marie Hoste, middle row; Colonel W. B. Smith, Stanstead Surprise, Avalanche, Sunflower, Gloire du Rocher, G. W. Childs, Mdlle. Laeroix, Boule d'Or, Ami Hoste, Mr. Bunn, Brookleigh Gem, Robert Cannell, Willie, Barbara, Princess Beatrice, and Princess Teck, front row. The second prize was awarded to Mr. Maxim, gardencr to the Hon. Miss Shaw Lefevre, Winchfield, who staged a highly creditable exhibit. Mr. W. Lane, gardener to Miss J. Durning Smith, Aseot, third, and Mr.

J. Tomlin, gardener to Mrs. Goldenham, Chertsey, fourth.

Mr. Lane was a good first for thirty-six blooms, distinct, eighteen Japanese and eighteen incurved. Mr. G. Barker, gardener to H. P. Lesehallas, Esq., Windlesham, was a very close second; and Mr. P. Harpley, gardener to F. Morrison, Esq., Sunninghill, a creditable third. Mr. Cole, gardener to E. W. Hamilton, Esq., Charters, Sunningdale, was a good first for twelve incurved blooms, distinct. This stand was composed of Mons. R. Bahuant, Jeanne d'Arc, Lord Wolseley, Princess of Wales; back row: Madame Darrier, Princess Teck, Prince Alfred, Mrs. S. Coleman; middle row: Alfred Lyon, Violet Tomlin, Beauty, and an unnamed pale pink variety. The second prize went to Mr. and an unnamed pale pink variety. The second prize went to Mr. F. Heereman, gardener to the Hon. Lady Isabella Keane, Rose Mount, Sunningdale; and the third to Mr. Joy, gardener to Mrs. Entwhistle, The Oaks, Sunninghill. Mr. H. Popple, gardener to the Hon. Lady Cowell Stepney, Wood End, Sunninghill, was an excellent first for six distinct incurved blooms, showing Princess of Wales, Violet Tomlin, Princess Teck, Prince Alfred, Jeanne d'Arc and Madame Darrier. Mr. R. Bird, gardener to C. J. Barnett, Esq., Kings Beeches, Sunninghill, second, and Mr. A. Hawthorn, The Gardens, St. George's School, Ascot, a fair third. For twelve distinct Japanese, Mr. A. Sturt, gardener to N. L. Cohen, Esq., Englefield Green, was a capital first, staging magnificent blooms; Mr. Heereman was a good second, and Mr. J. Cole third. For six Japanese, distinct, Mr. H. Popple was first. The second prize went to Mr. Joy, and the third to Mr. R. Bird. Mr. J. Woodhouse, gardener to Miss Belcher, Spring Grove, Sunningdale, was awarded the first prize and the silver cup for twelve reflexed flowers. Mr. J. Cole, was a close second and Mr. Thorne third. Mr. H. Popple was first for was a close second and Mr. Thorne third. Mr. H. Popple was first for six reflexed. Mr. Wm. Neate, gardener to Miss Thacker, Queen's Hill, Ascot, was second; and Mr. E. Smee, gardener to Captain Hanbury, Holmwood Lodge, Ascot, third. Mr. Joy, the only competitor, was placed first in the class for six incurved blooms of the Queen family with superb examples of Empress of India. Mr. G. Barker was first for six incurved, Queen type excluded, with large clean blooms of Mons. R. Bahuant; Mr. J. Cole being second with Violet Tomlin, and Mr. Hawthorn third with Prince Alfred.

In the class for six white Japanese one variety Mr. H. Bornle was

In the class for six white Japanese, one variety, Mr. H. Popple was first with magnificent flowers of Avalanche. Messrs. G. Barker and R. Bird being seeond and third in the order named with the same variety. For six coloured Japanese, one variety, Mr. Thorne was an easy first with Wm. Tricker, Mr. Barker seeond with the same variety, and Mr. Joy third with E. Molyneux. Mr. A. Sturt was a good first for six Anemone flowered varieties, Mr. Hawthorn being second.

for six Anemone flowered varieties, Mr. Hawthorn being second.

Mr. J. Cowie, gardener to V. L. Oliver, Esq., Whitmore Lodge, Sunningdale, took the first prize for a large group of Chrysanthemums. The arrangement was admirable, and the plants dwarf and well grown. Mr. Attfield was second, and Mr. W. Lane third. Mr. F. Heereman was first for a smaller group, Mr. White being second, and Mr. J. Edge third.

For four trained specimens, exclusive of standards, the first prize was deservedly accorded to Mr. White, gardener to the Dowager Marchioness of Conyngham, The Mount, Ascot; the third prize going to Mr. W. Lane. Mr. W. Neate was first for six specimen plants with a good exhibit, Mr. White being second, and Mr. Attfield, gardener to Sir W. Farmer, third. Mr. Neate was first for four Pompons in pots with well flowered plants, Mr. B. Harpley second, and Mr. Hawthorn third.

Mr. Thorne was first for a splendid group of miscellaneous plants, taste in arrangement and excellent culture being striking features of the exhibit. The Crotons were elean and splendidly coloured, as also were the Palms and Ferns. Orchids, which were represented by Oncidium tigrinum, Cattleya labiata, superb varieties; Cypripedium insigne and two grand seedlings were magnificent examples. Mr. J. Edge, gardener to Lord Harlech, Tetworth, was second; Mr. E. Smee third; and Mr. Hawthorn fourth.

The National Chrysanthemum Society's certificate for the best incurved bloom was awarded to Mr. Lane for a grand Baron Hirsch, and for the best Japanese to Mr. Popple for a superb example of Sun-

flower.

Miscellaneous exhibits, not for competition, were not numerous, that of Messrs. Sutton & Son, comprised of Potatoes of their own introduction, being prominent. Messrs. J. Standish & Co., Royal Nurseries, Ascot, arranged a fine group of plants, including Ferns, Palms, and Chrysanthemums.

HARDY FRUIT GARDEN.

Planting Fruit Trees.—Early in November is a good time for carrying out this important work. Advantage can thus be taken of the activity of the roots, which it is well known are disposed to freely produce fibres at this season, and to quickly repair any damage done to them in the process of lifting. Under favourable circumstances trees planted carly become well established before the winter, with the result that they start freely into growth the following year.

The Best Soil.—Good loam of a holding character, rich enough to encourage a firm vigorous growth without inducing grossness, constitutes a typical fruit soil generally. It should be clean, not tainted from the effects of powerful manures, friable to work, and well drained, either naturally or artificially. Stone fruits like calcareous soil best. If deficient in this matter add pulverised mortar rubbish or fresh lime.

Depth of Soil.—An average depth of 2 feet will usually meet the needs of most fruit trees. In light and dry soils an additional depth of 6 to 12 inches will be of advantage. In wet soils a rather less depth than 2 feet will be beneficial in keeping the roots in a warmer medium; indeed, in some cases it may be desirable to plant in mounds raised above the surface, so that warmth and comparative dryness of the soil may be secured, fruit trees never thriving with stagnation at the roots.

Manure.—In preparing soil just previous to planting fruit trees it is not desirable to add manure unless the ground is very poor. The best time to give it is in the spring or winter previously, heavily if necessary then, working the ground deeply, and taking off a crop of Potatoes or something which will sweeten the soil by abstracting from it some of the stimulating elements which cause rank gross growth in fruit trees.

Obtaining Trees.—Order fruit trees from nurserymen as early as possible, first comers being the best served. Personal selection is preferable, though those who cannot do this may depend on good firms doing that business for them as well or better than themselves if supplied with particulars as to soil, position, form of trees desired, and varieties required. In the case of Apples, Pears, Plums, and Cherries, it must be stated whether the varieties are wanted for cooking or dessert purposes. It should also be noted when ordering whether they are desired to be productive at an early period, or develop into large trees before heavy crops are expected. Trees of the former class will be on dwarfing stocks, which cause early productiveness, and such examples may be planted closer together. The latter are on free stocks, consequently ought to be planted at maximum distances.

The Best Trees.—Trees adapted for ready removal and furnished with abundance of healthy, fibrous roots are usually on hand in nurseries. They have been brought to this desirable condition with a view to being quickly moved without feeling the effects to an injurious extent, and when packed round with moist material to keep the roots from drying, then forwarded promptly to their destination, they are sure to do well if properly planted. The shoots should be clean and vigorous, medium in length and thickness. Avoid strong trees with very gross shoots, which will have correspondingly thick roots, lifting badly, and failing under the best circumstances to become established quickly. Another important point is to choose medium sized or small trees. It is better to plant small trees than to depend on large specimens if they come from a distance. Moving larger trees from one part of a garden to another, however, can be effected readily without suffering if they have been previously prepared for the process.

Root Treatment.—Having already pointed out how important a good supply of fibrous roots are to the speedy re-establishment of newly planted trees, it is equally important that roots, whatever their character, be kept moist from the time they are lifted until spread out in fresh soil. Cut smoothly all wounded, jagged and broken ends. Mutilated roots do not readily push fibres forth, indeed they often fail to do so at all, but gradually decay and die back. Any rambling roots may be shortened back within reasonable bounds, the whole being left so disposed that they can be spread evenly throughout the soil when planting.

wide enough so that the roots can be laid out horizontally from the stem outwards without being turned upwards at the ends. No great depth is necessary; it will suffice if the upper layers of roots are within 3 or 4 inches of the surface when planting is finished. See that the stems are not sunk lower than they previously were. This is an infallible guide in forming the proper depth of the holes and in disposing the roots. To plant below the earth mark causes the roots to be placed deeper than needful, with the result that trees do not thrive properly. Arrange the roots in layers, stretching them out to their full extent and having fine loamy soil in readiness mixed with a little burnt refuse, sprinkle the mixture upon them from the stem outwards. By this means the fibres are fixed in position and in the right direction. Treat each layer the same, making the soil firm by gentle pressure, not roughly treading, which often ruthlessly breaks the roots near their origin with the stem. After the fibres of each layer have been fixed and covered less

care will be necessary in throwing on the soil for forming a base for the next layer, but the roots should be evenly covered.

Staking.—All trees must be securely staked to prevent movement by the wind, and consequent dislocation of the roots out of their proper position. Standards may have a strong support down each side of the stem, round which some soft material should be wound to prevent the ligatures employed injuring the bark. The best tying materials are soft yielding copper wire and stout flexible cord.

Watering.—As dry weather is the best period for planting, it may occur that the ground is more than ordinarily free from moisture. Under such conditions water immediately after planting may be applied. It will fill up the interstices between the soil and roots, and help to consolidate the soil about them.

Mulching.—The last detail in connection with planting consists in mulching the surface over the roots with short strawy manure 3 inches thick. The mulch prevents frost entering the soil and injuring the roots, retards the escape of moisture, and serves to retain the natural heat in the soil longer than would otherwise be the case.

FRUIT FORCING.

Vines.—Early-forced.—The Vines for affording ripe Grapes in April must now be started, whether they be in pots or planted out. Those in pots are much the best, especially where bottom heat is provided, which, however, is in either case indispensable, yet in early forcing operations it is desirable. Place, therefore, fermenting materials in the pits in which those in pots are stood on pedestals formed with bricks. Do not allow the heat about the pots to exceed 70° to 75°—say, that at the base of the pots, and 65° higher up at the commencement. Suspend the canes in a horizontal position over the fermenting materials to insure a regular break. Syringe three times a day in bright weather, and when dull omit the late syringing, keeping every part of the house moist by sprinkling as the surfaces become dry. A temperature of 50° to 55° at night, and 60° to 65° by day will not be too much to begin with, as Vines started at this season require a higher temperature to excite the buds than those started later. Apply water judiciously in the early stages of growth, only keeping the soil moderately moist until the buds break, and afterwards increase the supply, corresponding with the advancing growth, but avoid making the soil too wet or the roots will decay.

Planted-out Vines should have the inside border brought into a moist condition by supplying water at a temperature of about 75°, or if the border is of an open nature, well drained, and the area comparatively small to the extent of rod, liquid manure may be advantageously supplied in a tepid state. The border or floor of the house may, if convenient, be covered with leaves and stable litter in a state of fermentation about 18 inches to 2 feet deep, turning the material over occasionally to prevent over-heating and liberate the ammonia, which is beneficial to the Vines and inimical to insects. The outside border also must be attended to; if fermenting materials are not obtainable cover with a good thickness of leaves, with a little litter over to prevent their blowing about. If the border slopes, and the litter is put on similar to thatch, much of the rain falling will pass off.

Vines for Starting in December.—Prepare the Vines and house for another start without delay, as early pruning contributes much to complete rest. In pruning two eyes suffice for affording useful bunches; but if large bunches are required the Vines should be pruned less closely, as it is necessary to have plump buds on stout, well-ripened wood if fine bunches are expected to follow. Longer pruning is also necessary when the buds at the base of the shoots are very small and pointed, instead of round and plump. But compact bunches are much the best for general purposes, as the berries swell to a good size, colour, and finish well. Large loose bunches are usually defective, especially in the case of early forced Vines. After pruning the Vine should be stripped of the loose bark only and be washed with softsoap and warm water. A solution of 4 ozs. to the gallon of water is strong enough, and if there is not any mealy bug or scale it will be all that is necessary. If, however, there has been any scale or mealy bug a dressing of some insecticide must follow, and it should be repeated before the Vines are started. Thoroughly cleanse the woodwork of the house, and limewash the walls. The surface soil should be removed down to the roots, and fresh lumpy loam supplied. Keep the house cool, admitting air freely when frost prevails.

Houses of Ripe Grapes.—Remove dead foliage where Grapes are hanging, and look over the bunches frequently for the removal of decayed berries. Maintain a temperature of about 50°, losing no opportunity of admitting air when the days are fine, turning on the heat so as to cause a gentle warmth in the pipes, and so insure a circulation of air and the expelling of damp, turning off the heat at midday or soon after, so as to allow the pipes to cool, and the temperature not kept above 50° at night, and 5° or even 10° less on cold nights, except for Muscats or where the foliage has not matured. In dull weather it will be necessary to keep a little warmth in the pipes, but the house closed, and in that case the moisture will be condensed on the glass instead of the Grapes.

Ripening the Wood.—Any Vines not yet hard and brown in the wood should be kept closely stopped, fire heat being still applied with free ventilation. The laterals should be brought down by degrees to the principal buds, which will have a tendency to cause rest, especially if air is freely admitted at night (but the temperature must not fall to freezing point) the house being kept rather warm, yet not close, by day, as that would have a tendency to induce growth. If the basal buds

are small, the shoots may be cut back to two or three leaves above the pruning buds, and this tends to plump them and induce rest in the 7 ines.

Figs.—Early Forced Trees in Pots.—If these have been placed in the open air they should be taken under cover to protect them from the cold autumn rains. Trees that are forced for affording fruit at the close of April or early in May will now need to have the wood brushed over, using softsoap, 4 ozs. to a gallon of water, brought to the consistency of cream by adding flowers of sulphur; but when using the mixture do not rub off the young fruit. Very little pruning will be necessary, the trees having been regularly stopped during the growing season, but if the growths are too crowded or irregular they must be thinned to render the trees open and symmetrical. Wash the woodwork and walls with hot water, and the walls afterwards with quicklime and sulphur formed into a rather thin wash, reaching well into every crevice. A mild bottom heat is essential to a successful swelling and perfecting of the earliest crops; the pots therefore must be raised on loose bricks in pedestal fashion to the position they are to occupy, and the pit be filled with Oak or Beech leaves firmly pressed. If the pit be not more than 3 feet deep a third of stable litter may be added. Avoid overheating, not allowing the heat about the pots to exceed 65° until growth takes The house should be kept close and moist by sprinkling twice a day in bright weather, employing fire heat to maintain a temperature of 50° at night, 55° by day, and with sun 60° to 65°. If the soil in the pots be dry, a thorough soaking of water must be given. Forcing operations need not begin until the middle of the month. St. John's, Early Violet, White Marseilles, and Brown Turkey are excellent varieties, and come in successionally; but the two first have small, and the two last large fruit.

Early Forced Planted-out Trees.—Trees in borders intended for early forcing should now be untied from the trellis and pruned. Those with the roots restricted to small borders, as Fig trees should be, will require little more pruning than thinning out the shoots where too crowded, but those not having the roots restricted will require a hard pruning at the upper part of the trellis, so as to allow for the growth of the branches, yet leaving a sufficient number of successional shoots for bearing. Fork the surface of the border lightly, remove the loose material, and apply a surface dressing of fresh loam not more than 2 inches thick. The roots will ramify through this, and they can be fed to any extent by mulchings, top-dressings, or liquid manure when the trees are swelling their crops. Ventilate fully at all times, except when frost prevails, and at such times heat should be used to exclude it or nearly so.

Succession Houses.—Prune the trees, cleanse the house, and put everything into thorough order. Dress the trees with a warm soapy solution, using a brush, which will do much to dislodge scale and render more potent the insecticide, which should be applied after the trees become dry after washing with the soapy solution. Complete any root-pruning and lifting. Any unfruitful trees must be severely root-pruned, and the roots restricted to moderate sized borders, depending more upon active feeders near the surface encouraged by mulching than a large extension of roots. Make the soil firm, employing one-sixth of old mortar rubbish and a similar proportion of road scrapings where the soil is deficient of calcareous matter and grit. To succeed with planted-out Fig trees it is necessary to restrict the roots to a limited area, and keep the growths well exposed to light.

Late Houses.—The trees in these showing a tendency to over luxuriance should be lifted and root-pruned, providing good calcareou gritty loam over thorough drainage and firming the soil well. This is an excellent remedy for trees casting their fruit in an unaccountable manner. Too rich soil and too large borders cause the trees to become exuberant and cast their first and only crop Figs, except in seasons like the present, when the second crop fruit ripened in many cases, and has not done any harm to next year's first crop where the second crop was only allowed on the bases of the current year's wood. When the leaves fall the trees must be unloosed from the trellis, and the branches being tied together in convenient bundles they should be made secure with some dry straw or fern amongst and over them or matting. The collar of the trees and for a little distance from the stem should also be protected with dry litter. This is only necessary in unheated houses, but frost must be excluded in heated houses or nearly so, otherwise the trees may suffer from severe frost, they sometimes being killed to the ground against walls when unprotected.

THE FLOWER GARDEN.

Clearing Beds and Borders.—If possible all the beds should now be cleared, the work of refilling being best done before cold wet weather sets in. When there are no attempts made to fill the beds with either spring flowering plants, bulbs, nor any ornamental shrubs and Conifers put out, the beds or borders ought to be simply cleared of plants and rubbish now, digging being completed after all the leaves from deciduous trees near at hand have fallen. In many cases it is scarcely necessary to dig the beds prior to refilling with a variety of bulbs and plants, moderately firm ground suiting these better in every way.

Refilling the Beds. — Those who have prepared abundance of Wallflowers, Polyanthuses, Primroses, Daisies, Silenes, Saponaria, Forgetme-nots, Limnanthes, and similar plants, and can therefore afford to plant these rather thickly in masses with suitable edgings, will most probably be rewarded with a fine display next spring. The strains of Polyanthus are now particularly fine, and if strong plants can be given

the benefit of a little fresh loamy soil their effect will be considerably enhanced. See that the plants are in a moist state when lifted, and move with a moderately large ball of soil about the roots. Violas suffered greatly from the drought, and young plants are scarce. These latter may, however, be supplemented by the old ones duly shortened back and replanted. Old plants of Golden Pyrethrum that have not been allowed to flower can be worked in again effectively, Stachys lanata being also quite hardy, and may be pulled to pieces and replanted now. Euonymus edgings can likewise be retained.

Small neat plants of Retinosporas, Cupressuses, Thujas, Yew, Junipers, and other Conifers are very suitable for flower garden decoration, these being planted in panels or masses according to their height and shades of colour, while taller well formed specimens are particularly well adapted for central and dot plants. With the Conifers may be associated neat plants of Hollies, Box, Euonymuses, Berberises, Ivies, Osmanthuses, Aucubas, Laurels, and berried plants of Pernettyas, Skimmia japonica, and Cotoneasters. Dwarf Rhododendrons well set with buds move readily, and would flower grandly next April or May. Single pieces of Yuccas are very effective as dot plants, a groundwork of Saxifraga crassifolia being very suitable. Nor should the value of Iris fætidissima variegata be overlooked, large clumps of this dividing readily. Neat branches of evergreens, notably Mahonias, Aucubas, Tree Ivy, Hollies, and Box thrust firmly into the soil in masses will keep fresh for several months, and are fairly good substitutes for plants.

Spring-flowering Bulbs.—Early in November is a good time to plant Hyacinths, Tulips, Narcissi, Daffodils, Leucojums, Crocuses, Scillas, and Snowdrops, a moderate outlay on new bulbs being all that is necessary to insure a charming display next spring. They may either supplement the other plants and shrubs already alluded to, or be chiefly depended upon to brighten up the beds in the spring. Indiscriminate mixtures should be avoided, Hyacinths, Tulips, and Narcissi being most effective when separately occupying the centres of the beds; while Crocuses, Scillas, and Snowdrops are most suitable for edging. Mixtures of one kind, or say of Hyacinths, are attractive enough, and so are masses of one colour. The bulbs of most of these may be planted 9 inches asunder each way, the miniature varieties being disposed somewhat closer, and should be covered by 4 inches of soil, a little sand under and about each bulb being used where the ground is of a heavy nature. Narcissi should be in every way treated similarly to Hyacinths, Daffodils being best planted in borders where they can remain undisturbed, while the neat growing Van Thol Tulips may well be planted 4 inches asunder each way and 3 inches deep, stronger varieties being disposed 6 inches apart. Snowdrops, Crocuses, Winter Aconite, and Scillas may either quite fill very small beds or be planted near the margin of the larger beds. Single lines look lost, and these small kinds should be planted in double lines or circles 3 inches apart and 4 inches deep.

Storing Summer Bedding Plants.—The best results attend the practice of putting out strong spring-rooted Dahlias, but in order to be certain of plenty of strong cuttings a good proportion of the old roots should be stored where either drip or frosts cannot reach them. Cut down the old stems to within 9 inches of the ground, fork out the roots so as to preserve most of the tubers, leaving a little soil, lay them on their sides for water or sap to run out from the stems, and dry before storing. They keep well in a dry cool shed, the roots being surrounded with sand or fine dry soil, and protected when severe frosts are anticipated. Gladioli also should be cut down after the tops are either ripened or damaged by frosts, and after the corms have been dug up, and well dried all, large and small alike, should be surrounded by sand in shallow boxes. Cannas should have rather more soil left on them than is necessary in the case of Dahlias, and after being dried somewhat should be stored in a warm dry cellar or greenhouse where drip will not reach them. Salvia patens is tuberous-rooted, and should be treated very similarly to Dahlias, while a few boxes may well be filled with the long fleshy roots of Verbena venosa. When frosts have blackened the tops of Tuberous Begonias lift the roots, leaving a little soil about the bulbs, and dry thoroughly in a vinery or other structure. When the stalks are quite dccayed remove them cleanly from the bulbs, and store the latter closely together on boards or in boxes in a dry cellar or shed where frosts cannot reach them.

Acacia lophantha, Grevilleas, Abutilons, Cyperus natalensis, and Marguerites can usually be lifted and placed in pots. If it is intended to store many of the old Zonal and variegated Pelargoniums pick off most of the leaves and shorten the roots, this admitting of their being packed closely together in either large or small pots. Given the benefit of a little dry heat they will not shrivel or damp off badly, and yield good cuttings in the spring. If Fuchsias are still green gradually dry them off with a view to hardening the wood prior to storing.

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Secretary, Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.— Secretary, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

ROYAL GARDENERS' ORPHAN FUND.—Secretary, Mr. A. F. Barron, Royal Horticultural Society's Gardens, Chiswick, London, W.

APIARIAN NOTES.

HIVE MAKING.

In answer to a question on the subject, I know of no bee book that gives "instructions in frame hive building on the latest and best principles." The standard hive is not now what it was when introduced with one-sized frames, but has two sizes, deep and shallow ones—an undesirable arrangement—and is, in fact, a combination of different kinds of hives.

The Lanarkshire storifying hive is undoubtedly the most suitable for bee-keeping in all its phases, no other being equally adapted for moving from one place to another, or wintering with equal safety to the bees. Instructions were given in the Journal of Horticulture some years since for making these hives, but as the numbers are not obtainable now I will, in the serial articles for beginners, repeat the instructions at an early date, from which any amateur can readily make his own hives.

HIVES AND HONEY.

There are few newspapers or other periodicals that do not contain some paragraph on the extraordinary fine season and large honey yield of a superior quality rarely experienced by the oldest bee-keeper living. The facts are, while the season has been a good one, it has been by no means more productive than many past ones that yielded double the quantities in half the time. Within the past few weeks I have examined many tons of honeycomb. The difference between that built in the so-called standard hives and those on the Lanarkshire and Stewarton principle is so great that the wonder is why bee-keepers persist in using hives like the former, that produce such inferior honeycomb to what the latter does. It may seem like boasting, but it is a fact, I have not seen a fine example of Heather supers from any hive but from the two lastnamed ones, and this is granted by all who have examined it.

HONEY AND HEATHER.

Lately there has been going the rounds of the press an article giving a description of the "honey harvest" in the south of Scotland, but it is so meagre that no one reading it can discover the slightest evidence of what the yield has been there, the writer appearing more anxious to take in other localities, and to depreciate the county of Lanark as a honey yielding district, save in the upper reaches of the Clyde; but in almost one breath he contradicts the statement, descanting upon the Leadhills district. He terms it an arid place, and that the aridness destroyed the Heather. Such is the statement we read.

As a fact I can say Heather was never known to be finer; much of it had yearling growths upwards of a foot long, with many lateral shoots, which formed deuse spikes of flowers instead of sprays, the dry and hot season being the sole cause, rain at all times being inimical to its growth.

RAIN IN THE NORTH.

It is singular that for many years the rain began to fall in Lanarkshire on the 7th of July. This year has been no exception, and from that date till the 13th of August there were only two days without rain, and after that for a considerable time the sky was overcast, so that for upwards of five weeks the sun was not seen for more than eighteen hours, the hay crop being dried with wind, and not sunshine.

BRIMSTONING BEES.

Many hives have been brimstoned by the owners who had no use for them, this too despite all the sensational talk that has been raised against the practice. I am against it, but what are beekeepers to do with surplus bees when they are of no use? This I have partly answered before, and will endeavour to do so again, at least to some extent.

HIVE EXPERIMENTS.

I have been an eye witness to several manipulations lately. At one place there were various kinds of hives from the Stewarton to Abbott's "Combination" hive. The former had beautiful supers, and no difficulty was experienced in removing them, while the operator was not much exposed to infuriated bees, the crown of the hive being as it ought nearly all closed. There were supers on the combination hives placed close up to the outer casing which is raised some 5 or 6 inches above the crown. The supers were fixed combs built from the top of the bars to the top of supers, they could not be separated by cutting, but had to be forced off.

Result:—One half of the combs were left adhering to the top of hive, and the other in the super. A blackened mass of combs and a great contrast to the supers from Stewarton hives, while the exposure of the whole of the hive subjected the operator to the fury of the enraged insects, which with properly constructed frames, and entrances to the supers at the sides only, would have been avoided. Nor was that the least of it, the enormity of their size precludes the possibility of them being profitably and expeditiously moved about, while so much exposed surface makes them expensive hives to keep up.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Reflexed Chrysanthemums (Reader).—You ask for twelve varieties, but as a rule not more than six or eight are asked for in stands of twelve blooms, and they can be chosen from the following varieties. Cullingfordi, Cloth of Gold, King of Crimsons, Pink Christine, Golden Christine, White Christine, Peach Christine, Chevalier Domage, Dr. Sharpe, Phidias, Putney George, and Annie Salter.

House for Tomatoes and Cucumbers (R. S.).—For summer work the ends of a span-roof house are best running north and south, and for winter a three-quarter span-roof house facing south is much the best. A span-roof with the ends facing the east and west is better for winter work than one with the ends north and south, but the plants do much better on the south than on the north side of the house.

Regrafting Apple Tree (R. S.).—For an espalier it would be much best to regraft the tree in the stem at A B in your sketch, putting in four grafts if this can be done without parting the bark from the woodall round, as there must be unraised bark between the grafts. You can take two growths up to form the branches you show us, C D, and reserve two for forming the lower limbs A B, or the two upper branches can be originated from two grafts inserted at the lower point, taking the strongest growths to form the limbs A B, and the weaker lower ones on the grafts to form the branches C D.

Clay for Cricket Field (Clay).—Perhaps the "Professional Player" thinks the ground is not firm enough, and he would like the turf removed and some clay mixed with the soil under it, the whole made firm and the turf relaid. If he thinks clay spread on the surface would do good, and your employer accepts his opinion, the best way of adding the clay would be in the form of small particles after drying and crushing. Burnt or charred clay would be the best. Without knowledge on the nature and texture of the soil we cannot advise on the matter, but simply answer your question. If clay is mixed with the soil under the turf, it should be in pulverised form, not raw lumps.

Marechal Niel Perplexities (S. S.).—The advice you quote is very good, and we have no doubt if the writer had a case brought before him of starved Roses in summer he would add to his advice, "Give liquid assistance without delay, no matter what the season of the year, if the soil is in a proper condition to receive it." The conditions of growth must always be considered in connection with the question of stimulants of any kind for any plants at any time. Your plants continue growing though you have given no water since the third week in August because the roots have found their way into moist soil, dry as the border may be near the surface. They often grow more freely but less substantially than when a mass of fibrous roots are imbibing better food from near the surface of the soil. Growths supported by such roots are usually short-jointed, and we have never known them fail to ripen under proper cultural conditions—full exposure to sun and air with freedom from insects. If your Rose border was mulched it may not have been very dry after all, but we do not like driving the roots of Roses, Vines, or anything else deep down into the earth by withholding them the needful moisture in the upper stratum of more fertile soil.

Grafting Medlar Tree (Constant Reader).— We have no experience of grafting a Medlar tree with another kind of fruit, which we presume is what you desire to do, as you say you "could put eight or nine grafts upon it if anything would do upon it." As the Medlar succeeds when grafted on Whitethorn (Hawthorn), seedling Pear, and Quince stocks, upon which also the Pear succeeds, you can regraft the Medlar, which you find is grafted on the Hawthorn, with some hardy variety of Pear, as the Hessle, Comte de Lamy, or Althorp Crasanne, with a probability of success. By this procedure you may secure a profitable tree in two or three years, and it is likely the fruit would be fine. If the Pear grafts do not take on the Medlar, graft with Hawthorn and then insert buds or grafts in the Hawthorn of some approved Pear.

Soils at Waltham Cross (Reader).—You do not know what is meant by the "different 'soils' being constantly under observation," as stated on page 385 last week. We do not wonder at this. The word "soils" was written sorts, in reference to the antecedent fruits, but was altered by the compositor, and his little error ought to have been corrected, but escaped notice by the proof reader. Compositors often have peculiar caligraphy to decipher, and but for lynx-eyed correctors some curious renderings would appear in the press. The other day we observed a reference to "the well-known firm of Messrs. Eatten and Sons," and another to "seneseniadeans." Only a moment's reflection was needed to transform the "Eatten" into "Sutton," and the other problem was eventually solved as meaning Jeanie Deans Potato. Printers like the names of persons and varieties to be made as clear as possible by correspondents, however hurriedly the general "copy" may be written.

Forcing Lilies of the Valley (H. B.).—Any particular kind of soil is not material in the early forcing of these flowers, thousands of them being raised by packing the crowns or clumps in pots or boxes of cocoa-nut fibre refuse, and forced in pits having bottom heat of 85° to 90°, and top heat ranging from 70° to 80°. The crowns are either covered 2 or 3 inches deep with fibre, or otherwise kept dark and constantly moist. When forced into flower early or before Christmas the crowns are of little or no further use. For spring flowering the crowns or clumps may be firmly potted now in a mixture of loam, leaf mould, and sand, the former preponderating, and buried in fibre or ashes in a frame like Hyacinths. The requisite number of pots can then be withdrawn at intervals and placed in a warm house so as to maintain a prolonged supply of flowers. If the pots can be plunged in a warm bed growth will be accelerated, and it is well to cover the crowns an inch or two deep with fibre or leaves. They will grow very well in a temperature ranging between 55° and 70°, or even less, but the lower the temperature the slower is the growth, and usually the sturdier the plants. If good foliage is developed, and this is well supported and matured under the full influence of light and air, late-forced plants will flower again another year.

Cratægus azarolus (H. P.)—As you wish to know whether the above Cratægus "is worth planting" we cannot do better, in answering your question, than to publish the following remarks of a competent gardener:—"Unquestionably this is one of the most beautiful Thorns we have, and it richly deserves the attention of those whose time and minds will be occupied during the next two or three months in planting and replanting various kinds of evergreens and deciduous trees and shrubs. At this time of the year it certainly has a very attractive and charming appearance, and cannot fail to elicit admiration from many who are not habitually close observers of the beauties of Nature, but whose innate love of bold and striking objects compels them, unconsciously as it were, to notice anything above mediocrity. For planting on lawns or in parks as single specimens it is admirably adapted, and where it does not already exist a few trees would add much to the scenery, and greatly improve the surroundings of any country or suburban residence. Its blossoms are probably less showy than any of the scarlet or common white. There but the have which the the scarlet or common white Thorns, but the haws which the trees are still bearing are exceedingly pretty, being of a beautiful bright orange-scarlet in colour, almost as large as Cherries, and borne in clusters of from three to ten, render it very conspicuous from a considerable distance. Although the character of the tree is seen to the best advantage when growing singly, we do not doubt but that clumps or rows along the outskirts of woods and plantations would be equally effective. If it were desired to heighten the effect a few clumps of Pampas Grass planted in front would form a very pleasing and striking contrast.

Names of Fruits.—Notice.—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any

beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (D. Watt).—1, Golden Pearmain; 2, Ribston Pippin; 3, Yorkshire Greening. (R. Barfoot).—1, Beurré Diel; 2, Bergamotte Esperen; 3, Duchesse d'Angoulême; 4, Beurré d'Amanlis; 7, Van Mons Leon Leclerc; 8, Perhaps Glou Morçeau, good fruit and well packed. (C.).—1, Beurré Diel (from the Quince stock probably, the fruit sent last week being from a Pear stock); 2, Worthless, graft the tree; 3, Susette de Bavay; 4, Minchull Crab; 6, Adam's Pearmain (fine). (W. J. B.).—1, Gloria Mundi; 2, Reinette de Canade; 3, Reinette de Caux; 4, Mabbott's Pearmain; 5, Royal Russet; 6, Franklin's Golden Pippin. (J. M.).—We think the names we gave are correct, but if you have a doubt and will send more than one specimen of each variety we will go into the matter again. (J. Ramskill).—Marie Louise. (II. O. S.).—3, Waltham Abbey Sædling; 4, Mère de Ménage, we have no other Apples from you. (P. K.).—New Bess Pool. (W. A. Jenkins).—1, American Mother; 2, Cellini; 3, Not known, worthless; 4, Dumelow's Sædling. (J. M. F.).—1, Large Cockpit; 2, Queen Carolinc; 3, Dumelow's Sædling; 5, Winter Colman; 6, Maltster; 7, London Pippin. (A.).—We are very sorry to say that owing to defective packing there was not one whole berry on the bunch of black Grapes, and the white berries were little better—a bruised broken mass, rendering the naming of the varieties impossible. If you send again you must pack more firmly, and we should also like to know whether the Grapes were ripened with the aid of fire heat or not. (J. D.).—2, Red Doyenné; 36, Maric Louise; 38, Cobham.

Names of Plants.—We only undertake to name species of plants, not varietics that have originated from seed and termed florists' flowers.

Names of Plants.—We only undertake to name species of plants, not varietics that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (L. M.).—Pothos argenteus. (H. D. P.).—1, Thunbergia affinis; 2, Hibiscus pedunculatus. (A. B.).—Dracæna australis. (Amateur).—Lapageria rosea. (M. P.).—Solanum corymbosum, the Corymbose Nightshade.

FARM PROFITS.

APPLICATIONS from eight farmers for a small dairy farm which becomes vacant next Lady Day, and the hire of that farm by one of them at a rent of £2 an acre (others were willing to give as much), show that farmers do not despair even after such a disastrous summer as that which is just ended has proved to so many of them. It tends also to show that while many a corn farmer is unable to pay a penny of his Michaelmas rent others continue to meet their engagements, and at any rate to make a "living profit" out of the land. Or, in other words, they are, by judicious practice, able to obtain sufficient interest upon capital invested to pay rent, rates, and household expenses. Taxes under Schedule A are the landlord's affair; if a tenant's income continues sufficiently good to render him liable under Schedule B it is surely matter for congratulation rather than complaint; only let the tenant see in his own interest that he is really liable for income tax. Surveyors of taxes are wont to make fanciful demands, which show powers of imagination, of which farmers are frequently the victims. Those very important collectors of Imperial revenue simply make their demand; it rests with the farmer to prove them in the wrong.

What we desire to see in the farmer is more business aptitude in the conduct of his affairs. Practice that is tentative, flexible, influenced by demands which are sound and sufficiently stable to justify change and concessions on his part. To enable him so to act that his landlord must deal fairly by him in removing all restrictions from covenants of agreement that are at all calculated to hinder him. For example, a matter under discussion in the Agricultural Gazette just now is the profit still possible upon an acre of Wheat. The cost of production is stated to be £6 7s., the value of produce:—

							£	S.	d.
34 bushels of	Wheat at	3s.	9d., or	30s. per	quarter		6	7	6
1 ton straw	•••	•••	•••	•••	•••	•••	4	0	0
							10	7	6
	Cost	•••	•••	•••	•••	•••	6	7	0
	Profit				•••		4	0	6

By this statement it is obvious that a restriction in the sale of straw would render a living profit impossible. Under high culture in good deep rich mixed soil, it is possible to bring the Wheat yield up to at least 40 bushels an acre with a proportionate increase in bulk of straw. Plenty of such corn land has come down in rent to 15s. an acre, and in these cases a really competent man is still prosperous. We refrain from giving details of cost, because such statements are always open to question, and it could serve no useful purpose to argue whether any item of expenditure should be less or more. The main question is all that is really important, and that appears to be clear enough.

It has come to this in farming, that a fermer must cultivate the right produce, and do it in the right way. The old easygoing times have departed never to return. The large farmer must now be his own steward or bailiff, sticking closely to business, giving his personal superintendence to every detail of crop or stock, working in point of fact in downright earnest, just like any other man of business. Why not, indeed? Where is the hardship? We know a gentleman in trade, who five days out of six is off to business by 8.30 a.m., only returning of an evening in time for his dinner at seven. He has thousands of artizans in his employment, and probably works harder than any of them. Very different to this was the life of the large farmer of twenty years ago. One of them well known to us used to hunt three days a week. An off-hand farm of some 400 acres in charge of a competent bailiff was visited by the farmer for an hour or two once a week or so. Yet profits poured into his hands from it in such abundance as now seems like a fairy tale. To such a man the loss of hunting, the having to devote the whole of his time and strength to actual business, is undoubtedly hard, but under stress of progress and competition the change was bound to come. He is a wise man who resolves to make the best of it, who is up and doing, resolutely setting himself to combat and overcome difficulties to which a weaker man succumbs, if necessary holding the plough himself, and thus command the respect which all good men and true accord to earnest effort and moral courage.

WORK ON THE HOME FARM.

Custom tells even in the matter of sowing our layers of mixed seeds. In some localities they are never sown with winter corn, but always, without exception, with spring corn. No good reason that we have ever heard of has been advanced for this custom, and from the extensive failure of plant in spring-sown layers this year, it would appear that there is considerable risk of failure when a spring drought sets in-not necessarily a long drought. April showers fail us quite often enough to render the matter worthy of serious attention, and it will be well if more of such layers are sown upon winter corn fields than has been done in the past. Mention is made of this now while so much winter corn is in precisely the best possible condition for such sowings to be done—that is to say, the corn plant is nicely visible above ground, and the seeds may be sown at once.

Acorns abound this year. They well repay one for collection. By

doing so all risk of injury to cows or cattle from eating them is avoided, and they can be stored for use both for pigs and sheep, for both of which they are really invaluable. Sheep fatten upon them quite as fast as they do upon Oats, and we have never heard any complaints of the flavour or quality of the mutton being hurtfully affected in any way. In a season of scarcity of food they are a great boon, as indeed they are

in any season. Look now carefully to all drain outlets, to the ends of water furrows in corn fields, so as to get water from drain and furrow quickly. Any stoppage of the drains soon tells upon the corn plant, checking its growth and causing it to lose colour. Land much infested with insect larvæ may now advantageously be dressed with salt. We may mention how highly beneficial salt has proved as a manure for all the Cabbage tribe in the Essex experiments. The amount used was 3 cwt. of salt and 2 cwt, nitrate of soda. The addition of the salt dressing to the nitrate added greatly to bulk of crop.

REMARKS.

22nd.—Almost continuous rain from 6 A.M. to 2 P.M.; overcast till about 7 P.M.; and cloudless from 8 P.M.

23rd.-Misty early, with sunshine; brilliant from 9.30 to noon; overcast after 1 P.M.

24th.—Overcast almost throughout, but one gleam of sun at 4 P.M.; fine night.

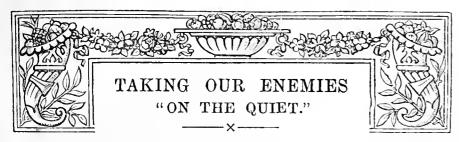

25th.-Overcast all day; rain from 10 P.M. to midnight.

26th.-Almost cloudless morning, and the sun only occasionally obscured in afternoon.

27th.—Almost cloudless morning, cloudy at times in afternoon, bright night.

28th.—A little sun early; overcast with occasional drizzle from 9 A.M.; fair afternoon and evening.

A fine autumnal week .- G. J. SYMONS.

GREAT deal has been written for and against—chiefly against -Shakespeare's assertion that the sufferings of a crushed beetle may be equal to the pangs of an expiring giant. Recent investigations in insect anatomy tend to prove that insects possess a nervous system, and that allowing for their size and the general structure of their bodies, they must have much more sensibility to pleasure or pain than the majority of naturalists have hitherto supposed. However that may be, I think all gardeners will agree that the destruction of their insect enemies, which has from time to time to be effected, ought to be managed so as to give no needless pain. Our fruit trees are attacked by a variety of species in different orders, but some of our very troublesome foes are the caterpillars of moths which damage the buds, the leaves, and even the flowers or immature fruit. Catering for their own benefit, they fulfil their name by "pilling" or peeling whatever they attack, and some of the smaller species do most harm by their numbers and persistency. It is to be regretted, I may note, that certain authors, either for the sake of swelling the list, or from ignorance, have given a bad name to species that are comparatively harmless.

That handsome moth, known as the Eyed Hawk (Smerinthus ocellatus) is mentioned as an enemy of the Apple, and it is true that its striped and horned caterpillar may be found on that tree, but it prefers Willow or Poplar, and is never abundant enough to do serious damage. An accusation has also been lodged against the green and gold caterpillar of the Emperor (Saturnia Carpini), but it is very soldom indeed discovered upon the Apple, as it prefers Heath and the Thorns. With all deductions, there remain far too many caterpillars against which precautions must be taken to check their increase, and it is desirable to kill our enemies while they are in a state of quiescence, whether as torpid, hybernating caterpillars, or as unconscious chrysalids, or in the earliest or egg stage. Hence the closing months of the year affords good opportunity for efforts that will be rewarded next season by a healthy, satisfactory growth of shoots, leaves, and fruit. The eggs of some species may be washed off trees by the simple application of warm water, others are removed by the operation of pruning. The use of the wash, which has been often recommended, made from petroleum and softsoap, will dispose of some hybernating caterpillars from the trunks and branches, also chrysalids which may be lodged in angles or in crannies.

Where we have reason to suspect that buds may contain larvæ of insects, it is advantageous to dredge them with soot and lime mixed in equal proportions. It is probable a strong solution of Gishurst compound will prove not only fatal to insects, but will destroy the vitality of eggs it touches. At various periods during the autumn numerous caterpillars descend from the trees and bushes to undergo pupation in or upon the earth, and the winter should not be allowed to slip away without some measures being taken to kill such chrysalids as can be reached. Many are on the surface of the soil, or just beneath it, and they can be extirpated by the removal and burning of an inch or two of the soil round trees, with any growth of grass or weeds that may be upon it. This is one means of checking the troublesome winter moth caterpillar, Cheimatobia brumata. Those that lie deeper in the earth may be reached by forking, and then applying quicklime or gas lime which has been

spread out and exposed for a month to the air, and will not then injure the roots of the trees or the underground stems. Quassia tea, made strong, is said to kill most chrysalids; I am not sure of this; a soapy solution might also, by obstructing the pores through which they obtain air, even underground.

Considerable attention has been called of late to the species just mentioned, and especially to the fact that the plan of placing a ring of some sticky substance round the trunks of the trees, to impede the ascent of the female moths, is not the effectual remedy once supposed, because some of them, though themselves wingless, are carried upwards to the stems and branches by their male companions. Still, many may be stopped by this preventive measure, and I think Miss Ormerod is right in her opinion that a better method than daubing the tree itself is to place a hayband or rope, well saturated with Stockholm tar mixed with grease, all round it, quite close, but not touching. Owing to the warmth and long continuance of the summer the winter moths were unusually forward this year, emerging at the end of October and early in November. It would be advisable, therefore, besides other precautions, to shake the boughs, as the moths fall readily, and their eggs should be looked for in crevices of the bark and angles amongst the branches. They have been detected on buds also. As each female can deposit about two hundred, it is not surprising that the caterpillars are abundant, and they do not seem to have any notable parasitic foe. But some birds seek them out, the starling especially. In Germany and France the caterpillar of the mottled umber (Hybernia defoliaria) is apt to defoliate the Apple. It is, however, solitary, though the eggs are laid in patches by the wingless females towards the end of the year; it is very common with us some seasons on Whitethorn and various trees, but is seldom seen on the Apple. It would have to be dealt with in the same way as the winter moth caterpillar should it visit the Apple

Upon these I have sometimes found caterpillars of the figureof-eight moth (Diloba cæruleo-cephala), but it is more frequent on Whitethorn. Abroad they complain of the species as an early enemy of the Apricot and Peach, for it is rather a hearty eater. The eggs are laid at the base of lateral shoots by the end of September usually, four or six together. Vigorous spraying would probably remove them. No washes, however, will operate upon those of the lackey moth (Bombyx neustria), which are not uncommon upon the twigs of the Apple every season, and are placed in rings, protected by a sort of varnish. The caterpillars being exceptionally abundant during last May and June, it is likely there was a larger deposit of eggs than usual subsequently, hence the spirals of eggs should be sought and removed. The newly hatched broods of caterpillars are often overlooked by the English grower of fruit. In France the proprietor of an orchard is very careful to inspect the twigs early in the season, and cut away the webs enclosing the young colonies.

With regard to those caterpillars that live through the winter socially, there is no excuse for the fruit grower if he neglects to hunt up their nests; fortunately for us the brown tail moth, so injurious abroad, and the black-veined white butterfly have at present ceased to trouble us. Last spring the small ermine (Hyponomeuta padella) had numerous broods on the Apple, but owing to the drought some of these perished; still it is advisable to examine the twigs for any of the new brood that may be waiting for next spring. The eggs are laid during the autumn under a patch of brownish green, which is much the colour of the tree, and the young caterpillars remain under this without eating from October to April. Amongst the chrysalids that may be destroyed now are those of the codling moth (Carpocapse pomonana), for in our country the greater number of these Apple pests quit the fruit when it falls as soon as possible, and ascend the tree nearest at hand, where they spin a little cocoon under the loose bark. -ENTOMOLOGIST.

FEEDING PLANTS AND ENRICHING THE SOIL IN THE AUTUMN.

CONTINUING my remarks on this subject from page 350 I will in the present article deal principally with that portion of it which treats of the feeding of plants growing in pots or tubs. I think few will deny that much of the success achieved in the growth of such depends to a great extent upon the manner iu which this phase of culture is conducted. Given equal conditions in other respect, the gardener who feeds his plants the most liberally and regularly on rational principles produces the best results. I say rational principles advisedly, because it is quite possible—nay, easy to do irreparable mischief by applying liquid manures before the soil is sufficiently permeated with roots to be benefited by them; or to give the liquid in too strong a state, and thus destroy the medium through which nourishment is principally supplied to plant life. When, however, roots are plentiful and active they revel in a constant supply of fertilising food, under the influence of which health and vigour is increased and maintained; but should the matter be neglected between the stages of growth which intervene between the time when feeding begins and the crop of flowers or fruit approach maturity a corresponding degree of vigour is lost. Observant cultivators know well that the higher the level of culture aimed at the more clearly is the slightest neglect apparent.

The rapid strides towards perfection which have in recent years been made in the growth of plants in pots renders it necessary for all who wish to maintain a position among the front rank of cultivators to pay especial attention to feeding more or less throughout the year. So long as the plants are not in a state of comparative rest, do not show signs of excessive growth, or have been recently repotted, few mistakes can be made by giving weak applications of liquid manure. It is scarcely possible to say too much in favour of the best chemical manures now freely advertised, containing as they do the most important elements of plant food. Thousands of grand plants are annually grown in small pots, which, without the aid of such manures, I believe, it would be impossible to produce in the same bulk of soil. Then there are other instances in which large plants have to be kept in pots or tubs for years without repotting; with the help of these patent manures, and occasional waterings with soot water or natural liquid manures, they may be kept in excellent condition. I will now endeavour to show how these general principles may be put

into practice in the growth of various plants. Camellias and Azıleas do not, in my opinion, receive so much assistance from chemical manures as they should do. The practice of feeding well during the time growth is being made, and then giving only clear water through the rest of the year, is even now practised by many, and the result is that to keep the plants so treated in a thriving condition much larger pots than are really necessary have to be employed. Bud-dropping in Camellias, and weak, thrip-infested growths on Azaleas, are often brought about by starvation pure and simple, especially when the plants are grown entirely in peat, in which they have a tendency to grow strongly and rapidly exhaust the soil; then, unless regular feeding is given, slowly but surely they drift into an unsatisfactory state. manures here come to the rescue. If given once a fortnight during the summer, and once a month during the winter, the best results follow, even when the roots are much confined. Provided the drainage is good, and the soil porous and sweet, these plants do not require repotting nearly so often as they receive it if instead they are fed regularly in the way indicated. Anyone who is sceptical on this point can easily prove it for themselves by setting apart two plants in an equally healthy condition, both having also plenty of active roots. Let one be given a monthly application of chemical manure, and an occasional dose of soot water, while the other receives clear water only, or perhaps a few waterings with liquid manure given at irregular times. If they will follow this course from the time growth is completed till the flowering period I am convinced they will entertain no doubt as to which is the better plan to follow.

Again, note the difference between the massive trusses and vivid colour of the flowers of Zonal Pelargoniums when chemical manures are given and when they are not applied. Under some circumstances, to give such manure in the autumn and winter would result in strong growth and but little flower. When, however, the plants have been properly prepared for winter work the results speak for themselves. Given plants with short-jointed growths, growing in small pots crammed with roots, place them in light houses close to the glass, give abundance of air, and keep a little heat in the hot-water pipes constantly, then even in winter the plants may be kept well laden with bloom colour.

Bouvardias, Cyclamen, Primulas, Carnations, Euphorbias must be well fed even at the dark season of the year if strong plants and

flowers are wanted. The amount of growth made will always be, to a great extent, regulated by the heat, light, and water which vegetation receives; but the full benefit of such essentials can only be obtained by plants which have within their reach the chemical constituents needed to build up their growth. In dull weather fewer applications of water are required. This shows that the amount of nourishment drawn from the soil is small indeed compared with that taken up during the prevalence of sunshine, and seems to be Nature's mode of balancing the amount of growth made with that which the light and air are capable of solidifying. Bearing these facts in mind, it is easy to see that our cultural practices often err in the direction of neglecting to feed plants during the dull season of the year for fear of inducing sappy unripened growths. In bygone days, with old and dark houses, and primitive methods of heating them, there may have been good reasons for adopting what I term the starvation system; but with plants thinly disposed near the glass in the light airy structures which fortunately are now the rule, a more liberal system of winter-feeding is attended by vastly improved results. -H. Dunkin. (To be continued.)

VINE CULTURE—A RETROSPECT.

LOOKING back to the days of Meredith of Garston, Hill of Keele, and Henderson of Trentham, a trio of growers who doubtless did a great deal in the matter of Grape culture, it seems to me that with all the extended appliances we ought to have a better knowledge of Vine growing. Those readers who can remember even a quarter of a century back, and look now at the advantages for Grape culture of the present day, must admit that we make bad use of them if we do not have a more intimate knowledge of the subject in question, and produce results in proportion. young men of former days never had an opportunity of seeing Vines grown so extensively as they now are. I do not say that the practice is much improved in private gardens, though even here vineries have increased, the produce being sometimes sold to meet expenses. But it is the extensive market growing establishments that should send forth a number of expert hands

I have to credit the northern growers with producing the largest berries in Grapes; but I think southerners excel in weight of crop, and possibly finish. If we could, as growers, increase the size of individual berries at the same rate as we do the crop, what a sight we should present to the public! But it is not so, the fact being no matter how correct are the conditions of the Vines from which we obtain extra large berries, even when we crop lightly, the results to the enthusiastic grower are disappointing. True a perfect finish combined with full sized berries is a pleasing sight, yet on estimating the weight of crop we still think we ought to have better. I take it that in cropping we have made rapid strides, and yet the Vines are kept in good bearing condition. Probably the market man is always more or less disappointed at the selling price of his best Grapes, the price not being in proportion to the quality, inferior though still good fruit paying far better. seems to be a limit for shop trade as regard prices, thus at anything under 2s. per lb, say 1s. 9d., I can sell cwts. of fruit, whereas I do not sell pounds above; this is in bulk say up to end of November. Then Muscats are always wanted when not above 2s. 6d. per lb.; but as one of my largest customers says, he fears now I have put up to 2s. 9d and 3s. per lb. it will be too much for him. High prices are tempting, but though I treble the prices I have quoted before the end of spring, it is in limited amounts, and the real trade is in good Grapes at medium prices. Inferior, faulty Grapes are more than ever a drug in the market, shops of any pretension not caring to have them. With a more extended cultivation of the Vine and an increased practical knowledge we can do what we should have been afraid of in our early days.

I have refrained from dealing with the large bunches, as they are of no practical use for the market man. Accidentally such bunches do come, and I have them now hanging, Gros Colman up to 6 lbs., but I have not grown these specially, the Vine having its full complement of bunches. To devote a Vine to special bunch growing is always a failure. Take a good Vine, reduce to a few, say three, four, or six bunches, and the weight in them would not equal the ordinary number of bunches had they been left. Though such bunches do finish well the money is wanting when they come to be sold. I shall always credit the growing trade with raising the standard of finish in shop Grapes, and those who have any common goods have only to send to a market and the salesman will quickly give him a very low price, and even then he does not care for them. The aim of all Grape growers, be they large or small, should be first to study the Vine itself, both root and rod, and crop according as it will bear it. Varieties, of course, differ, and these have to be noted. One season's experience will not do all

this, it is a question of years.—Stephen Castle, F.R.H.S.

CYPRIPEDIUM STATTERIANUM.

This is a richly coloured and very distinct Cypripedium. It is the result of a cross between C. Spicerianum magnificum and C. vexillarium superbum, and when exhibited at the Drill Hall on Tuesday, October 24th, the Orchid Committee of the Royal Horticultural Society awarded a first-class certificate for it. From a sketch of the one flower which the plant bore the illustration (fig. 61) has been engraved. The dorsal sepal is principally rosy purple and has a distinct white tip and margin, the petals and hip being greenish brown.

CATTLEYA LORD ROTHSCHILD.

Much interest was centred on a plant of Cattleya Lord Rothschild which was exhibited at the Drill Hall, Westminster, on Tuesday, October 4th, by Messrs. F. Sander & Co., St. Albans. The plant in question bore magnificent flowers, and from one of these the illustration (fig. 62, see page 425) has been prepared. This Cattleya is a new hybrid, being the result of a cross between C. Gaskelliana and C. aurea. The sepals and petals are large and of a faint rosy mauve shade, but the lip is the most striking feature in the flower. This is very large, of a rich purplish crimson shade, with a crimped white margin, the throat and basal portion being orange yellow veined white and magenta crimson. The flower is sweet scented.

Odontoglossums.

Many plants that have made strong well-ripened growths will be producing flower spikes. A watch must be kept for slugs at the present time, for if they are allowed to exist a large number of spikes may be ruined in a night. A little cotton wool placed round the spike is an admirable plan, but the safest is to suspend the plants from the roof until the spikes are firm and thus safe from the ravages of these most troublesome pests. Keep a sharp look out for aphides, and eradicate them at once, for when they are allowed to establish themselves upon the flower spikes they soon injure and deform the blooms. I am no advocate for fumigating these plants, but remove these insects by means of a soft brush and a little weak tobacco water. Shading is often practised late in the autumn by many growers, but ours was removed early this year for the purpose of allowing those growths to become thoroughly matured. The plants must not be allowed to suffer by the want of water either at the roots or in the atmosphere. Keep them close to the glass and admit air freely when favourable, and the flower spikes will be stout and compact instead of weak and slender.—Specialist.

WINTER CUCUMBERS.

In some gardens it is found to be a difficult matter to produce a regular supply of good Cucumbers during the winter, and especially if the necessary heat is not to be obtained from hot-water pipes. Where all requirements are at hand, however, partial failure sometimes results. There are several causes of failure—namely, sowing the seeds too late, or rooting cuttings late if they are preferred, after treatment as regards

the growth of the plants, and attention to their roots.

If the plants are raised from seeds or cuttings they should be strong and in good condition for planting by the middle of October at the latest. If possible they ought to be grown in a house which affords plenty of light. The soil must consist of one-half leaf mould and one-half good sound loam well mixed together. Whether pipes be placed under the bed or not, a hotbed composed of strawy litter and leaves ought to be made up if room will permit. The soil when placed upon the bed need only be so thick as to cover the manure, but where the plants are to be planted mounds of soil must be formed, allowing one barrowload to each plant. Avoid planting too closely, 5 or 6 feet asunder will answer better than 3 feet. The plants should not be unduly excited in the autumn. A sturdy short-jointed growth must be the aim of the cultivator.

In dealing with the training of the shoots of Cucumber plants during the summer I always like to pinch the side shoots at every joint, but in the winter I prefer to leave three joints before pinching. The advantage of planting a good distance as under will be here apparent. The shoots ought to be allowed plenty of room to grow in, affording light, and giving solidity to them. Constant attention must be given to pinching and tying the young growths. The prunings should be no more than may be carried out in the attendant's apron each week from a large-sized house. If crowding of shoots occur, and wholesale thinning follows, three weeks or a month's dearth of Cucumbers results. Only a few

fruits may be left on the plants at one time; each fruit as it becomes fit must be cut off forthwith.

Additions of soil mixed the same as that recommended for planting in may be placed, after being warmed, on each mound once a fortnight as a top-dressing, and pressed down firmly. If this practice be regularly carried out no feeding with liquid manure will be necessary till after Christmas. The temperature of the house must be regulated according to the state of the weather outside. A genial temperature should be maintained, not too much moisture, especially in frosty weather, but sufficient to keep the plants in good health and free from red spider. Syringe the foliage well on fine days, not later than 2 P.M. Model and Telegraph are good varietics for winter culture.—GEO. GARNER.

WINTER TREATMENT OF VIOLETS.

HERE the culture of Violets in the winter is made a speciality, two pits, each 64 feet long, facing due south, and adjoining the outside borders of the principal range of vineries, and three three-light frames

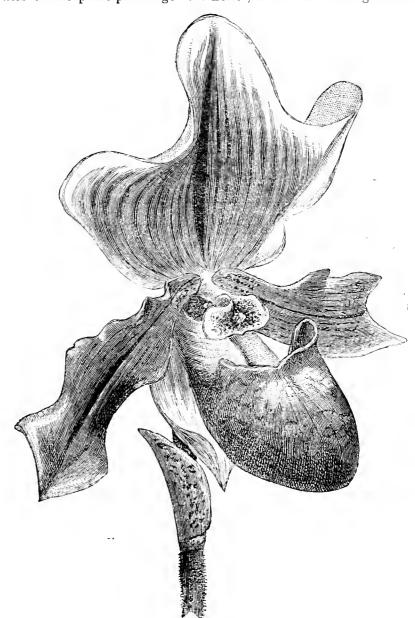

FIG. 61.—CYPRIPEDIUM STATTERIANUM.

being devoted to their culture. In addition to these two or three hundred plants are grown in 6-inch pots for standing on the side stages in the conservatory and for intermixing with decorative plants in the Castle. For some weeks after planting out our plants (single crowns) early in May, in rows from 12 to 15 inches asunder, and the same distance apart in the row, they made very little, if any, growth, notwithstanding the fact that they were watered every afternoon, and the soil between the rows stirred from time to time with the Dutch hoe. By continuing the above operations energetically, however, and keeping the runners well pinched after free growth commenced, we have been rewarded with fine "many-crowned" plants, every one of which have been transferred to their winter quarters.

Prior to planting additional leaves were put into the pits and well trodden, following with a coating of short manure to the thickness of about 2 inches, and over this about 9 inches of a mixture consisting of five parts fairly good soil and one of short manure, the whole having been passed through a half-inch sieve before being placed in the pits and frames. The plants were taken up with good sized balls, the straggling roots being cut back to the soil through which they pushed, and then planted in rows about 1 foot asunder and at the same distance in the rows. The plants in each succeeding row were set triangular, which manner of planting affords more room for light and air to play amongst them than if they were planted squarely—opposite each other—the soil being pressed firmly about the individual plants in planting. The plants must not be put any deeper in the soil than they were before, and keep them close to the glass without touching it. After planting we

afforded sufficient water to settle the soil, shading the plants for a few days from sunshine, and damping them at closing time in the afternoon during the same period. Then the shading was dispensed with as well as the syringing, and the sashes drawn off during favourable weather and replaced at night, tilting them up a little in the absence of frost.

The after treatment will consist in giving plenty of air on every favourable opportunity that presents itself, guarding against excessive damp, as the greatest evil which the cultivator of the Violet in unheated pits has to contend with during the winter months, keeping the runners persistently pinched, bad and damped off leaves being removed at the same time, the soil scratched over with a pointed stick, and giving tepid water at the roots when the condition of the soil renders its application necessary. An occasional top-dressing of Thomson's Vine and plant manure before giving water will prove beneficial during the next five months, being careful not to let it come in contact with the leaves in strewing it lightly over the soil between the plants. As a means of protecting the plants from injury by frost we cover the sashes at night with Eddy's "dressed canvas," to which cords are attached for securing them in position, and small staples driven into the wall-posts at intervals of about 5 feet. When severe frost is expected a few inches thick of dry bracken are laid on between the glass and the canvas covers.

The varieties we grow are Marie Louise, Patria, blue (very much like the former, but of a deeper colour); Dc Parme, pale lavender colour; Comte de Brazza, large double white flowers; Victoria Regina, deep blue double flowers; the two last mentioned being for spring flowering. We also grow a few plants of The Czar, large blue flowers. In a fortnight we have gathered 200 large bunches of Marie Louise and Patria, which varieties we find the best for autumn and winter flowering.—H. W. WARD, Longford Castle.

PELARGONIUMS AT WINDSOR.

IT would be a difficult matter to find a class of plants so universally popular, or more deservedly so, than are Zonal Pelargoniums. amateur with his little greenhouse, and may be a frame, can have them in oloom all the year round by a judicious insertion of cuttings and assiduous attention to other details of their culture. But it is to Zonal Pclargoniums under the guise of winter blooming plants as grown by Mr. Thomas in the Royal Gardens, Windsor, to which these notes are intended to call particular attention. The plants are now, when beautiful flowers to brighten our homes are all too scarce, commencing to bloom. In floriferousness, brightness, and general utility they are unrivalled, the "Autumn Queen" being unable to cope with the brilliant hues of these flowers. The collection at Windsor is an extensive one, and includes many, if not all, the finest varieties in cultivation. The plants are flowered in 6-inch pots, and form at the present time a dazzling display. One is liable when so much is heard of Cannell's Pelargoniums to think that it is at Swanley alone that they may be seen to perfection. Such, however, is not the case, for the plants grown by Mr. Thomas are equally healthy, and carry as many flowers as those of the justly celebrated grower above mentioned. This will certainly be acknowledged by all who are privileged to see those now under notice. It will doubtless be interesting to many readers of the *Journal* to know what varieties are the best in this collection, both for habit and

The selection cannot be opened with a better or more useful kind than Miss Gordon, which is purplish red in colour with a clearly defined white eye. The pips are large and of perfect shape. A free blooming semi-double scarlet is found in La Bruant, the habit of which is very fine. Only one single white variety appears to be grown, and by the way this is blooming none other is required. Queen of the Whites justifies its name, for the colour is of the purest, the shape of the best, and the trusses amongst the largest. The habit, too, is excellent, dwarf and sturdy, and carrying its chaste flowers just clear of the healthy green leafage. A very beautiful deep rose is Kate Turner, and Freiza may be considered one of the very best of the scarlets. The pips are of exceedingly rich colour, and contour of the truss leaves nothing to be desired. Gloire Lyonnaise is a very beautiful deep rose-coloured flower, and for a pure salmon nothing more beautiful or more useful could be desired than Mrs. F. G. Hill. The truss is exceptionally large and perfect in form. Eiffel Tower is a double rose-hued variety of much merit. La Cygne is a splendid double white, and Madame Thibaut a grand double pink. One of the very best in the collection is A. Grisau. The pips, which are rather over the medium size, are deep pink in the centre, and have a broad white margin, which, whilst greatly enhancing its beauty, renders it remarkably showy and attractive. A delicate rose-tinted variety of great beauty is Luther de Medluc, and John Fellowes is a grand scarlet.

Lady Russell is a variety which attracts universal opinion, the colour being of a beautiful rose with a prominent white eyc. Another pink of a high order of merit is Heather Bell. The pips are rather small in size but of perfect shape, as also is the truss. In colour it is a shade deeper than Lady Russell, and is totally distinct in habit. Both are worthy a place in any collection. Lady Reed is one of the most charming. The petals are white at the upper parts whilst the lower is a clear rose, which produces a striking effect. The truss is of medium size but perfect in contour. The dwarf habit of Louisa Penith is a great recommendation to an already good variety. The rosy red coloured trusses

stand sturdily out from the foliage of the plants, which are of exceptional dwarfness. F. V. Raspail stands unrivalled amongst the doubles. The pips are large, and the colour of the most vivid scarlet. A good double rose is found in Dr. Thousent, the flowers of which are of medium size and the trusses large. The silver variegated foliage of Chelsea Gem is very striking amongst the other varieties, the flowers, too, being attractive. Amongst the dwarfest is Heroine, a double scarlet, and, as a good companion for the two previous named, Madame Thibaut might be named. The growth of the plants is singularly alike, and the trio is unquestionably a good one. The list cannot be closed without reference being made to a very handsome flesh-coloured seedling, of which Mr. Thomas is wisely taking much care, for it will undoubtedly be an acquisition in a class of plants which is already rich in grand varieties and superb colours.—H. J.

MR. MAWLEY'S ANALYSIS OF 1893.

In support of my statement (page 384) that the analysis cannot be said throughout to be mathematically correct, I should like to give two typical instances. Viewing the fact that the analysis is said to be deduced from the experience of several years, they are fair instances in support of my argument. In the few remarks I add I have the agreement of others, who are fully as experienced as either Mr. Mawley or myself.

Madame Hoste is a beautiful Rose, which has been well known to all of us for some years. It is in Mr. Mawley's analysis of 1890. It is there given as No. 25, and placed in analysis as exhibited an average of seven times. Last year it was shown eight times, and Mr. Mawley has it still low down, No. 26 and 7.9, working on its actual exhibits. This year, although the Rose has been in the analysis since 1890, all these previous facts and figures are ignored, and the figure of twenty-one exhibits in 1893 is taken as the correct average for a series of years. Can this be called mathematically correct? I have not one word to say against the Rose, but I take exception to this fresh start and unreal position given to it, as 1893 was not a typical year for it. The Rose being one with light petals, the heat of this year was not really favourable to it. How it only appeared in eight winning boxes last year is surprising, as 1892 was eminently favourable to its growth. That it happened to be shown in twenty-one winning boxes in 1893 I look on simply as mere chance.

In the same way Ernest Metz has been exhibited in winning boxes for some years; it has been in the N.R.S. schedule in a special class since 1891. I cannot tell how long previous to this Mr. Mawley has had his eye on it, but the Rose is not in his analysis of 1890. Last year it was placed in the analysis as an average of 12 (on previous performances, I suppose), but this year previous performances are ignored, and 30 is given as its "average," but apparently solely on the exhibits of 1893. Is this mathematically correct? It is well here to recall the fact that Mr. Mawley has altered his system of working his analysis I think more than once; that which he now thinks infallible he may hereafter find a flaw in. It is also worth mentioning that an analysis which may work satisfactorily in regard to Dahlias and Chrysanthemums, of which apparently hundreds of new varieties are produced annually, need not necessarily be of equal value in regard to Roses, of which very few new varieties are thought worthy of attention. Finally, although Mr. Mawley may think "crude figures" to be matters of trifling importance, we in the City have a theory which hitherto has been found to work out mathematically correct, and it is that we like to have our accounts and analysis worked by crude figures in preference to having them changed in any way.—Charles J. Grahame, Croydon.

[We stated that in our opinion the results as given by Mr. Mawley were mathematically correct as deduced from the elaborate and painstaking system adopted in their preparation, and we were confirmed in this opinion by a gentleman of world-wide fame, whose life has been spent in elaborating deductions as true as he can represent them from ponderous masses of crude figures. Mr. Mawley can have no objection to a fair examination of his work, but he very properly objects to being charged with "cooking," a rough city method of expression in this reference that is not merited, and which does not meet with general approbation.]

LORD PENZANCE'S HYBRID BRIARS.

I HAVE to acknowledge Mr. Charles J. Grahame's allusion to a previous paragraph of mine on page 396. If he reads attentively Sir Walter Scott's "Lady of the Lake" he will find that the Eglantine is a native of the Trossachs Woods, which I recently saw in all the glory of their autumnal hues. It also grows wild in the woods of Galloway, as I can testify from personal observation. I have a vigorous specimen of the Sweet Briar Rose growing in front of my manse which, during the months of July and August, is a mass of pink blossoms, and is at present perfectly covered with its beautiful berries. It was, many years ago, trausplanted from a wood in the parish, which overhangs the sea,

and where wild Roses and Honeysuckle grow most luxuriantly, the latter climbing up the trees to a height of 20 feet.

I am much obliged to Mr. Grahame for the additional information he gives me regarding the Hybrid Briar Roses of Lord Penzance. It is interesting to learn that the names of those Roses have been taken for the most part, as Mr. Grahame indicates, from the immortal romances of the "Wizard of the North." I recently had the pleasure of meeting with a venerable daughter of his much-loved amanuensis, Mrs. Laidlaw, and talking to her in Edinburgh on horticultural subjects, in which she is much interested. She had come all the way from Inverness to the Scottish capital in order to be present (at the age of eighty-four) at the Patti concert. My kind hostess on that occasion was a daughter of the late Rev. Dr. Nathaniel Paterson, of Glasgow, author of "The Manse Garden," an interesting and instructive work of the last age, written by an intimate friend and associate of Sir Walter Scott.

The names which Lord Penzance has selected for his Roses are complimentary to Scotland, and indicate his reverence for the genius of our greatest novelist, who was, like all men of poetic tendency and artistic

nature, a great lover of flowers.—DAVID R. WILLIAMSON.

PLANTS IN SEASON.

SALVIA GRAHAMI.

AMONG the many beautiful varieties of Salvias that flower at this period of the year, I think none are more worthy of recognition than S. Grahami. Though not so showy as the brilliant scarlet of S. splendens, or the soft rose of S. Bethelli, it is nevertheless one of the most useful Being very dwarf and compact in habit, it is of the whole genus. admirably adapted for arranging amongst various other greenhouse plants. It has an extraordinarily free-flowering character, producing its long racemes of flowers all through the autumn and winter. Abundance of manure water should be supplied whilst it is flowering.

RUELLIA MACRANTHA.

Although one of the best and most beautiful winter flowering plants in cultivation, this Ruellia has unfortunately been so very much neglected as to be scarcely ever met with. In habit and character it is very similar to Thrysacanthus rutilans and Centropogon Lucyanus. The beautiful trumpet-shaped flowers, which are produced in great profusion from the axils of the leaf, are of a rosy purple colour, and last a long time in perfection. Propagation may be effected by cuttings, which should be inserted in sandy soil, and placed under a hand-glass. When should be inserted in sandy soil, and placed under a hand-glass. well rooted they should be placed in small pots, using a mixture of good turfy loam and leaf soil in equal proportions, with a small amount of fibry peat and sharp sand. The plants ought then be grown in a stove, and potted as occasion requires. I trust these few timely remarks may be the means of reinstating this most needly and shown Problem may be the means of reinstating this most useful and showy Ruellia into every establishment where winter flowering plants are in demand, as no collection can be considered complete without it.

BEGONIA JOHN HEAL.

This charming plant possesses sufficient attractions to warrant its admission into every garden. For arranging with the various occupants of the intermediate house at this season I know of nothing to compete with it, owing to its dwarf habit and floriferous character. To grow these plants successfully the tubers should not be started too early. This is a very important point to bear in mind. The best plan is to let them grow gradually and without much forcing. After they are fairly started the plants should be placed into small pots and put in an intermediate temperature. Apply water judiciously till after the roots have taken full possession of the soil, when it may be supplied with greater freedom.

Good peaty loam, leaf soil, and sharp sand will form an excellent compost for the plants. Green fly and mealy bug are particularly troublesome, more especially the latter, consequently a sharp watch should be kept, and immediately the least signs of it are detected means must be taken to exterminate it, for if it is once allowed to become fairly established it is useless to expect satisfactory results. The best method of destroying mealy bug is to pick it off with a fine pointed The best stick, as the plants are very impatient of any insecticide being used on them. I feel sure where once this Begonia has a fair trial it will not fail to give satisfaction.—G. PARRANT, Ashby Lodge Gardens, Rugby.

PARTICULARS ABOUT PEARS.

Would Mr. Molyneux, Mr. Luckhurst, or others of your correspondents, kindly state their experience of the following Pears—Doyenné du Comice, Fondante d'Automne, Beurré Superfin, Madame Treyve, Durondeau—as regards the particulars given below, the locality of cultivation being fairly favourable for their growth?

- 1, Are they of good hardy constitution?
- 2, Are they good, fertile, and tolerably reliable as bearers?
 3, Do they succeed well in the "bush" form?

As regards flavour and high quality I do not think either of them has been surpassed. For richness of flavour and honied juiciness I have always regarded the Gratiola Pear as being unequalled; but this, of course, is a matter of individual taste.—W. M. B.

EVENTS OF THE WEEK .- As mentioned below, the Committees of the Royal Horticultural Society will meet at the Drill Hall, Westminster, on Tuesday, November 14th. Numerous Chrysanthemum Shows will also be held during the ensuing week, and a list of some of these will be found on another page.

- THE WEATHER IN LONDON.—The weather in the metropolis continues cold but dry. Frosts have occurred on several nights recently, although not very severe. At the time of going to press it is rather cold, the wind being in a north-easterly direction.
- Hailstorms, but of short duration, were prevalent on Tuesday in the South of England, and we hear of considerable damage being done at Dover.
- THE WEATHER IN THE NORTH. The weather during the past week has been very changeable, dry and wet days alternating Friday was very especially wet and cold throughout. Frosts of from 2° to 8° have been recorded every morning, and there seem indications of a spell of cold weather.—B. D., S. Perthshire.
- TESTIMONIAL TO MR. MANNING. After consulting Mr. Manning's wishes it has been decided that the presentation shall take the form of an illuminated address and a dining-room suite with clock and ornaments to match. The presentation waits Mr. Manning's convenience for a few weeks, he being at present away from London.
- ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, November 14th, when special prizes for Chrysanthemums will be offered. At three o'clock Mr. R. Parker, F.R.H.S., will deliver a lecture on Chrysanthemums.
- PRIZES AT THE GARDENING AND FORESTRY EXHIBITION.-Many gardeners will be glad if, through your medium, a request may be made that the prizes won by the successful exhibitors be paid without delay. Many gardeners were put to a considerable expense in getting fruit and flowers to London to help to make up the Exhibition. In the schedule it states "that all prize money will be paid within a month of the exhibitions," and now that the officials have had their banquets I think it time that the prizewinners were paid what is due to them .-EXHIBITOR.
- —— GARDENING APPOINTMENTS. Mr. S. Clarke, for the last three years head gardener at Airfield, Dundrum, Co. Dublin, has been appointed head gardener to T. R. Bolitho, Esq., Trengwainton, Penzance, Cornwall. We understand Mr. Arthur Pope succeeds Mr. G. Bartle as head gardener at Allington Hall, Grantham, Lincolnshire, the seat of J. E. Welby, Esq.
- BROWALLIA MACRANTHA.—Mr. Elsey, gardener to Mrs. Carlisle, showed in a group of plants at Ewell last week several specimens of this Browallia. They were from 15 to 16 inches in height, well foliaged and flowcred. The blooms are large, open, five-lobed, and very much the colour of the bracts of Bougainvillea spectabile. It is easily raised from cuttings put in during the spring, and makes an excellent autumn and winter house plant.—A.
- PRIMULA CHELSEA ROSE.—Mr. Buss, gardener to A. W. Aston, Esq., also showed at Ewell a dozen plants of a four-leaf single and lovely flesh pink Primula under the above name. The plants were well done, the flowers large and well fringed, the foliage of the pale green colour, and in all presents a very beautiful variety.—A.
- THE SCILLY ISLES DAFFODILS .-- A Western contemporary says that the exceptionally dry and fine weather at the Isles of Scilly threatens to seriously disarrange the coming flower season. The weather is still so fine and mild that the crops in the open are coming on rapidly, and unless cold weather sets in to check them the flowers will be in the market considerably before those from the forcing houses are usually ready. The first small consignment of yellow Narcissus (Soleil d'Or) from the open field was forwarded last week, while very few of the bulbs intended for forcing are yet put in the houses.

- BULLFINCHES AND BUDS.—Mr. J. Hiam writes:—"It may be as well to remind fruit growers, in districts where these birds are numerous, that for about six weeks they are very easily taken in trap cages or with birdlime, and turned to account as pets for cage birds or in aviaries, instead of shooting them in the spring."
- EUCHARIS AMAZONICA.—Lovers of this beautiful flower will be pleased to know that the Eucharis is admirably grown by Mr. George Ward, London Road, Bishop's Stortford. In looking over his houses of Eucharis the other day I was amazed to find the plants in such health and carrying large numbers of flowers, which it would be useless for me to describe.—EUCHARIS.
- PROPERTY IN MUSHROOMS.—At the instance of the Westmoreland County Council, all the County Councils in England are having brought before them a resolution in favour of the law being so altered that persons who trespass upon land in search of Mushrooms and other spontaneous growths will be liable to conviction, as in the case of stealing cultivated roots. Great annoyance and indirect damage to farmers is caused by such trespasses at present, and there is nothing in the criminal law to prevent it.
- THE INTERNATIONAL HORTICULTURAL SOCIETY which was founded at the recent Congress of horticulturists held at Chicago has made further progress. The chief object of the Society is to facilitate the exchange of plants, seeds, and books. The following officers have been nominated:—President, Mr. P. J. Berchmans; Vice-President, Mr. Henry L. de Vilmorin; Secretary and Treasurer, Mr. George Nicholson, the Curator of Kew Gardens. We learn, however, that Mr. Nicholson is unable to undertake the work that this office would impose upon him.
- A New Rose-coloured Calla. A correspondent sends us the following extract, written by a Dutch bulb firm, referring to the new Calla with rose-coloured spathes which appears to be now attracting attention:—"This Calla, received from Africa, represents an entirely new type of Richardias, the leaves being lanceolate instead of sagittate, as in all species hitherto known. The spathe is of a very elegant shape, and the colour is white tinted with rose, especially well marked on the outside. The bud shows a rose colour, which afterwards changes into white with a rose tint." The provisional name of De Waal's Richardia has been adopted until botanists decide its Latin designation.
- SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, OCTOBER.—Mean temperature of month, 50.2°. Maximum on the 16th, 67.0°; minimum on the 30th, 27.2°. Maximum in the sun on the 1st. 120 5°; minimum on the grass on the 31st, 19.2°. Mean temperature of air at 9 A.M., 50.5°; mean temperature of soil 1 foot deep, 50.6°. Nights below 32°, in shade two, on grass sixteen. Total duration of sunshine in the month, 120 hours, or 37 per cent. of possible duration. We had three sunless days. Total rainfall, 1.69 inch. Rain fell on thirteen days. Average velocity of wind, 8.1 miles per hour. Velocity exceeded 400 miles on one day, and fell short of 100 miles on seven days. Approximate averages for October: Mean temperature, $48\cdot1^{\circ}$; sunshine, eighty-three hours; rainfall, 2.73 inches. Another warm, bright, and dry month. None of the last twelve Octobers had as much sunshine, and only two out of the last seventeen had a higher mean temperature, and none of them had as high a mean daily maximum.—J. MALLENDER.
- TECHNICAL EDUCATION IN HORTICULTURE.—The Council of the Scottish Horticultural Association having been again allocated a portion of the residue grant by the Town Council of the City of Edinburgh has arranged a course of lectures on the "Vegetable Garden," to be delivered during the ensuing winter and spring. The scientific and practical aspects of the subjects chosen will be treated of by eminent authorities, and the lectures will be free to all interested in the advancement of horticulture. The introductory lecture will be given by Mr. M. Dunn, Dalkeith. "The Chemistry of the Vegetable Garden" will be treated in six lectures by Mr. W. Ivison Macadam, F.R.S.E., F.I.C., F.C.S. "Physics as Applied to the Vegetable Garden," in three lectures, by Mr. A. N. Macalpine, consulting botanist to the Highland and Agricultural Society. "The Chemistry of the Soils: The old and new Doctrines," in two lectures, by Dr. Hunter, Minto House. Mr.A. H. Scott, The Gardens, Cambusdoon, Ayr; Mr. Williamson, Tarvit, Cupar-Fife; Mr. Loncy, Marchmont, Duns; Mr. P. W. Fairgrave, Dunkeld, and Mr. Temple, Carron House, Falkirk, will lecture on the practical cultivation of different crops. Mr. Robert Laird, 17, South Frederick Street, Edinburgh, is the Honorary Secretary.

- LARGE GOURDS.—Messrs. Sutton & Sons write:—"We note in a paragraph appearing on page 400 of the Journal of Horticulture reference is made to a Gourd weighing 30 lbs. It may interest your readers to know that we have one grown by a customer of ours (Lieut.-Col. E. Morrell, Mistley Hall, Manningtree) weighing 142 lbs., and from the same plant others were cut weighing 112 lbs., 100 lbs., 85 lbs., besides others of smaller weight. The variety is our Mammoth Gourd."
- Weather in Scotland.—The total rainfall for October was 4 239 inches, which fell on twenty-eight days; greatest fall on any one day 0 887 inches, on the 24th. Drains were first observed running for the season on the 25th. Frost was registered on two nights—the 30th, 24.8°; and the 31st, 22.6°. The warmest day was the 15th, when 63° were registered; and the 16th was the warmest night, with 54.9°. Mean maximum, 55.6°; mean minimum, 39.3°.—G. McDougall, Stirling.
- The Floral Sketch Book.—The Council of the Royal Horticultural Society have granted special permission to Mr. John Weathers, Assistant-Secretary, to publish his plant sketches. Mr. Weathers informs us that he proposes to publish under the above title five large drawings each month of as many new, rare, or interesting plants. Each plant figured will be fully described, and historical and cultural notes will also be given. The first number will be ready by January 6th, 1894, and the price will be 1s.
- —— ROYAL METEOROLOGICAL SOCIETY.—The meetings of the Society, which will be held by kind permission of the Council of the Institute of Civil Engineers, at 25, Great George Street, Westminster, will for the future commence at 8 p.m. At the ordinary meeting on Wednesday, the 15th inst., the following papers will be read:—"The Great Drought of 1893, and Its Attendant Meteorological Phenomena," by Frederick J. Brodie, F.R.Met.Soc. "Thunder and Hail Storms over England and the South of Scotland, July 8th, 1893," by William Marriott, F.R.Met.Soc.
- Dalkeith Agricultural Society has, so we learn from an agricultural contemporary, carried out some interesting experiments by means of prizes offered to growers to ascertain the heaviest cropping sorts of Potatoes, and what manures are best to be employed to obtain largest results. The first prize was awarded to a crop of 12 tons 7 cwts. 3 qrs. of sound Bruce to the acre, grown with 20 tons of manure, 4 cwts. kainite, 4 cwts. supers in drill, $1\frac{1}{2}$ cwt. nitre when through, and $1\frac{1}{2}$ cwt. when earthed up. The second prize went to an acre of Regents weighing 12 tons 6 cwts. 3 qrs., of which 10 tons 7 cwts. were good, 1 ton 12 cwts. 1 qr. small, and 7 cwts. diseased. This crop received 24 tons of farmyard mature to the acre, besides 1 cwt. of dissolved bones and 1 cwt. of nitre in the drill.
- A FEW PRETTY PLANTS.—At the little Show at Ewell last week I noted some plants of more than usual interest at this season of the year. Mr. Whiteman had Salvia splendens Bruanti in fine form, large bushes $3\frac{1}{2}$ feet through, beautifully flowered, and in 9-inch pots. Then he also had several plants of Salvia Pitcheri, each carrying good spikes at about 3 feet in height of intensely rich blue flowers. It is a most effective plant at this time of the year. The roots are tuberous, and require the same treatment as does Salvia patens. Aralia Chabrieri is a Croton-like plant. This was represented by a specimen 3 feet in height, very handsome indeed, and because of its long narrow pendant leafage it makes a peculiarly charming table plant. The same grower had Giant Red Capsicum in fine form, plants some 2 feet in height and heavily fruited. It is for exhibition or for sideboards a most effective variety.—A. D.
- —— CAREX JAPONICA.—This beautiful perennial Rush-like plant is one which should be grown extensively by all who have to carry out dinner-table decorations. Its slender variegated leaves, which attain a length of from 1 to 2 feet, are extremely light and graceful in appearance; in fact I know of no cultivated plant to equal it in this respect, which renders it an ideal plant for the above purpose, and thus enables the decorator to produce a light wavy surface without impeding the view across the table. The cultural requirements of this Carex are extremely simple, as it thrives well in almost any soil, succeeds in either a cool or warm structure, and requires but little root room, excellent examples being produced in 3-inch pots. Propagation is easily effected by root division, by which means a good stock may quickly be worked up. Those who are unacquainted with this plant should lose no time in obtaining it, and I feel sure they will consider I have not over-estimated its intrinsic merit.—H. D.

- THE ROYAL GARDENERS' ORPHAN FUND .- At the recent meeting of the Committee of the Royal Gardeners' Orphan Fund, W. Marshall, Esq., in the chair, the following special receipts were announced :- Mr. W. Elphinstone, The Gardens, Shepley Hall, Derby, opening the gardens during the summer, £11 1s. 6d.; Mr. J. H. Vallance, local Secretary, Bristol, legacy, £3 3s.; Mrs. Bowerman, Hackwood Park, sale of flowers, £1 6s.; Mr. J. Plowman, Woodstock Gardens, Long Sutton, box, 10s.; Mr. G. Tubb, Minley Manor, Farnborough, box. £1 2s. 2d.; Miss Barron, Chiswick, box, £1 11s.; Mr. F. A. Burbury, Highbury, Birmingham, box, £1 16s.; Mr. J. B. Stevenson, Chine Cottage, Bournemouth, box, 6s. 5d.; and Mr. C. Sutton, The Gardens, Chevening Park, Sevenoaks, 6s. 5d. The Secretary reported the receipt of £100 from Mr. N. Sherwood (Messrs. Hurst & Sons) as a jubilee celebration gift, and a hearty vote of thanks was passed to this generous supporter of the fund. The death of Mr. Hugh Low of Clapton, a member of the Committee, was alluded to, and a resolution of condolence with Mrs. Low on the great loss she and the Committee has sustained, was passed.

— Gardening and Forestry Exhibition. — Among the awards made at the recent Gardening and Forestry Exhibition, Earl's Court, for permanent exhibits, we noted the following names:—Gardening section.—Gold medal: Messrs. J. M. Bennett & Sons, Ardwick, Manchester. Silver-gilt medals: Mcssrs. Sutton & Sons, Reading; Messrs. J. Cheal & Sons, Crawley, Sussex; Messrs. Ransomes, Sims, and Jefferies (Limited), Orwell Works, Ipswich; Messrs. Joseph Owen and Sons, 67, St. Anne Street, Liverpool; Messrs. Conway G. Warne (Limited), Weston-super-Mare; Messrs. F. Rosher & Co., King's Road, Chelsea; Mr. G. W. Riley, 81, Dnlwich Road, Herne Hill, S.E.; Miss Sarah Sprules, Wallington, Surrey; and Messrs. Chaffey Bros. (Limited) 35, Queen Victoria Strect, E.C. The forestry section included—silver medals: His Royal Highness Prince Christian, K.G.; Mr. John Mickie, Her Majesty's Forester; and Colonel Beddome, F.R.H.S.

- THE WINTER MOTH.—Mr. J. Hiam, The Wren's Nest, Astwood Bank, near Redditch, observes, "This pest is making its appearance in strong force, as was to be expected after such an exceptionally favourable season for developing, and if grease-banding is to be resorted to instead of Paris green spraying in the spring no time should be lost. It may be well to call to memory that it was after the dry season of 1887, that 1888 and 1889 were so disastrous from the ravages of these caterpillars, and the orchards and plantations were stripped of truit and foliage. We have obtained much intimate knowledge since then of the habits of our common enemy, and we know that the female moths may be stopped if grease-banding is properly done. Egg-laying is chiefly carried out from the middle to the end of November, and if this month and December are mild a great increase in numbers next year will inevitably follow. We read in the summer that in Devonshire much damage was done from caterpillars, and it would be interesting to know if they were Cheimatobias or what kind?"

OPEN SPACES.—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W., the Earl of Meath, the Chairman, presiding, it was announced by him, as reported in the Journal of Horticulture last week, page 400, that the Prince of Wales had consented to become the patron of the Association and had contributed ten guineas to its funds. The Secretary also mentioned that a donation of £50 had been received from a member for the erection of a handsome drinking fountain in St. Thomas's Square Garden, Hackney; that the necessary consents had been obtained for the daily opening to the public of the Tower Wharf, instead of twice a week; that the Battersea Vestry had agreed to form a riverside recreation ground at a cost of over £2000, towards which the Association had offered to subscribe £1000: and that the laying out of Victoria Park Cemetery and the Pem Road Triangle was being satisfactorily carried on. It was agreed to offer to lay out the churchyards of St. Matthew and St. James's, Bethnal Green and Ion Square, Hackney Road, if their maintenance were secured, and if money for the payment of wages to those in want of work were forthcoming, the Association providing the balance, about one-half, of the total cost. It was also decided to offer to lay out Albion Square, Dalston, Bessborough Gardens, S.W., and Guy's Hospital disused burial ground, S.E., if transferred to the local authorities for maintenance; to offer trees for the Albert Embankment and other thoroughfares; to once more endeavour to prevent the Physic Garden, Chelsea, from being sold for building purposes; to promote the acquisition of five acres of land once forming part of Wandsworth Common; and to offer to bear the expenses of opening to the public a playground in Clerkenwell, when not used by the scholars.

—— RASPBERRIES IN OCTOBER.—Mr. W. Gabbitas, Harrogate, writes:—"I noticed several correspondents in the Journal of Horticulture (page 399) mention gathering Raspberries and Strawberries in the south, but I have not heard of anyone securing a second crop so far north as Harrogate. It might, therefore, be of interest to some readers to know that I have to-day (November 4th) gathered several ripe Raspberries and more are about half matured. They are on the new canes of this summer's growth. We have also been gathering Scarlet Runner Beans until a week since."

THE TOTAL RAINFALL FOR OCTOBER AT ABBOTS LEIGH, HAYWARDS HEATH, SUSSEX, was 4.26 inches, being 0.31 inch above the average. The heaviest fall was 1.45 inch, on the 11th. Rain fell on nineteen days. The maximum temperature was 64°, on the 21st; the minimum 27°, on the 31st. Mean maximum in the shade, 57.29°; mean minimum, 42.26°; mean temperature, 49.74°, about 4° above the average. The frost on the morning of the 31st is the first we have had to injure tender plants, and up till then Runner Beans and Dahlia blooms have been as fine as they have been this year. Some good Roses were gathered that morning, and Chrysanthemums on south front of house are still uninjured, showing their usefulness.—R. I.

— The Weather Last Month.—Mr. W. H. Divers, Ketton Hall Gardens, Stamford, remarks:—"October was changeable, but chiefly fine after the 7th with a fair amount of sunshine. We had seventeen bright days, two of which were clear. The wind was in a westerly direction twenty-nine days. Total rainfall was 2.48 inches, which fell on fifteen days, the greatest daily fall being 0.69 inch on the 7th; the total is 0.46 inch below the average for the month. Barometer—highest, 30.45 at 9 p.m. on 23rd; lowest, 29.16 at 1 p.m. on 4th. Temperature milder than usual—highest in shade, 67° on 16th and 21st; lowest, 29° on 31st; lowest on grass, 21° on 31st. Mean daily maximum, 58.54°; mean daily minimum, 42.54°; mean temperature of the month, 50.58°. Tender flowers, such as Dahlias and Heliotrope were not killed by frost until the 31st. It has been a very fine autumn for Wheat sowing. The garden spring ran $8\frac{1}{2}$ gallons per minute on 31st."

THE WEATHER IN HERTFORDSHIRE.—Mr. E. Wallis, The Gardens, Hamels Park, Buntingford, Herts, writes:—"The weather during the past month has been all that the horticulturist could possibly desire. There has been an abundance of rain, which has not in the least been a hindrance to outdoor work. The weather has also been of a very mild and open character. Taking the month all through, it has doubtless been one of the best Octobers ever known, and not until the morning of 31st was there sufficient frost to destroy such tender plants as Coleus and Iresine, when 7° were registered. Taking the year up to the present doubtless few gardeners have had such good all-round crops during any other season. Rainfall on fourteen days during the past month.—Maximum in any twenty-four hours was 1.06 on the 8th; minimum, 0.02 on the 22nd. Total during the month, 3 06, against 3.90 of 1892."

PEARS VERSUS PEACHES.

In answer to Mr. Molyneux on page 373, the figures previously quoted were those affixed to the fruit in the shop windows, and I considered that the grower could not be so badly treated when such a price was asked by the fruiterer. I could mention several instances around me where small growers have realised handsome prices for Pears, owing to their taking their produce round to the villa residences and so doing away with the middleman. Was it altogether a question of money which "C." had in his mind when he wrote the article on page 259? If so, I did not quite look at it in that light alone, but thought he referred to those persons who have private establishments.

Even if the market grower only was to be studied, I maintain that a wall covered with cordon Pears, well selected, and liberally fed with manure water during the summer, the result being magnificent fruits, would eventually prove far more profitable than Peaches in many parts of Lancashire. It is useless to expect to realise the best prices for unthinned fruit. There can be no doubt that where Peaches are known not to succeed that they might wisely be done away with, planting Pears in their stead. "C.'s" article is so carefully worded, persuasive, and so full of sound reasoning, that very little exception can be taken to it. Referring to Marie Louise Pear, I may say that it does splendidly here, and we have no Pear which gives us such a succession of fruit. Beurré Diel crops well also. From a wall we get large fruit and by no means badly flavoured. The worst flavoured fruit comes from the pyramids, at least so we find it here.—R. P. R.

PEACH LEAF BLISTER.

I TAKE this opportunity of thanking Mr. Abbey (page 373) for giving us the benefit of his scientific studies of the diseases of plants. He has brought to light many things which have been hidden from our

view, and I have no doubt he will further enlighten us on many more

diseases of which we are ignorant of at the present time.

About ten years ago we bought a dozen Peach trees, and planted them against a south wall. In the following spring one of them, about in the middle, had several blistered leaves, but none of the others had any on them. The next spring the same tree was worse affected, and a few odd leaves were blistered on the tree nearest to it. understand how cold winds could cause blister to come in such a peculiar way, and as I thought it might be either an insect or fungus, I gave the tree which was first (and the worst) affected a thorough syringing with softsoap, 2 ozs. to the gallon of water, which I repeated after a week's interval. The following spring the tree which was washed had very little blister, but it had considerably increased on all (or nearly all) the other trees. I then gave all the trees two good washings with the same admixture, which I follow up every spring, with the result that only slight traces of blister were visible this spring.—B. L. J.

CHRYSANTHEMUM SHOWS.

WE have received numerous intimations of Chrysanthemum shows which are to be held during the current month, but space can only be found for the enumeration of those that have been advertised in our columns up to date, of which the following is a list:-

Nov. 10th and 11th.—Bradford.

- 14th and 15th.—Twickenham, West of England (Plymouth).
 15th and 16th.—Birmingham, Hull, Bristol, South Shields, Rugby.
- 15th, 16th, and 17th.—Herefordshire. 16th, 17th, and 18th.—Edinburgh, York.
- 17th and 18th.—Bolton, Sheffield. 24th and 25th.—Eccles and Patricroft.

MR. SMEE'S CHRYSANTHEMUMS.

WE are informed that Mr. Smee's Chrysanthemums at The Grange, Hackbridge, Carshalton, Surrey, are open to public inspection every afternoon this week, also on Sunday next. The display is described as an excellent one, and no doubt numbers of persons will avail themselves of the privilege kindly afforded and opinion the foundation of the found of the privilege kindly afforded, and enjoy the floral treat provided by the skill of Mr. Cummins, Mr. Smee's most competent gardener.

CHRYSANTHEMUM LUCY KENDALL.

PERHAPS a note on this variety may not be inopportune now that it has been named in the Journal of Horticulture, and may, if it were necessary, set aside any doubt as to the distinctness of this variety. Lucy Kendall is a direct sport from Violet Tomlin, possessing all the characteristics of Princess of Wales. In colour it is pleasing, the middle part of each petal is deep purple violet, shading to a lighter tint near the edge. When unfolding the tip of each petal is gold colour, which passes away with age.—E. M.

A LARGE VIVIAND MOREL.

I HAVE a Viviand Morel Chrysanthemum that I think is an extraordinary size. I put a piece of string round the bloom and it measured 24 inches, and if raised and the petals spread out over 36 inches. Placing a piece of string over it extending to the bottom of the petals, it was $16\frac{1}{4}$ inches. What do your readers think about it? It is perfect as regards the colour.—F. J., Olton.

WHITE VIVIAND MOREL.

ALTHOUGH there may be a pure white variety in existence as a sport from Viviand Morel, it would be wise for "A Young Beginner" (page 402) not to exhibit what is apparently a new variety until the white is produced direct from cuttings in a general way, and especially developed from terminal buds, or, what is better still, grow a plant of it as a bush. If the whole of the blooms retained their purity of colour then, there could possibly be no doubt about the genuineness of Viviand Morel is so fond of sporting in the various stages of development, that it is hard to say what colour we shall obtain next from this grand Japanese variety.—E. MOLYNEUX.

I FEAR your correspondent, "A Young Beginner" (page 402), would not be allowed to show a white flower on the same board with Viviand Morel as a distinct variety. I had one, as I thought, thoroughly fixed last year, and sent it out as Mrs. W. R. Wells. I am sorry to say it has reverted to the parent variety. This I much regret, as I felt so confident of its constancy. If your correspondent had these plants through me I shall only be too pleased to substitute any other varieties as I guaranteed when I sent out plants of Mrs. W. R. Wells last spring.— W. Wells, Earlswood Nurseries, Redhill, Surrey.

[We suspect that any exhibitor is fully justified in staging a pure white form of Viviand Morel in the same stand with its deep pink prototype, as the two blooms, *pure* white and deep pink, would be

absolutely distinct. The two forms were staged in a prize stand at the Crystal Palace Show, and we suspect the judges did not entertain a thought of disqualification, nor are we aware that a protest was made by any exhibitor. The judges at the Crystal Palace were Messrs. T. Bevan, W. Coomber, R. Dean, J. Douglas, W. Earley, G. Gordon, J. Hudson, J. Laing, J. Willard, J. Wright, B. Wynne, and G. Wythes.]

CHRYSANTHEMUMS AT JESMOND TOWERS.

I AM glad to see you are making a striking feature of Chrysanthemums in your Journal. On Friday last I went to see one of our best growers in the north, Mr. T. J. Wheeler, gardener to C. Mitchell, Esq., Jesmond Towers, Newcastle, who cultivates nearly 500 plants, which are in excellent health and are carrying grand flowers. The best flowers of older varieties are Viviand Morel, Bonle d'Or, Florence Davis, W. Tricker, W. H. Lincoln, Bouquet des Dames, Etoile de Lyon, Coronet, Stanstead Surprise, Gloire du Rocher, La Triomphant, Cleopatra, Sunflower, Edwin Molyneux, Avalanche, Stanstead White, and Mdlle. Marie Hoste. The best new ones include Mrs. C. H. Payne (grand), Mdme. Edouard Rey, Elma D. Smith, G. W. Childs, Le Verseau, Miss Dorothy Shea, William Seward, John Shrimpton, Princess Victoria, Mrs. Neville, President Borel, Robert Owen, Excelsior, Colonel W. B. Smith, Mrs. W. H. Fowler, Lord Brooke, Beauty of Exmouth, Lucy Kendall, and Charles Davis (grand). Incurved blooms are rather later, but the best W. H. Fowler, Lord Brooke, Beauty of Exmouth, Lucy Kendall, and Charles Davis (grand). Incurved blooms are rather later, but the best are the Princess and Queen family, Mrs. Shipman, Mons. R. Bahuant, Baron Hirsch, Mrs. Clibran, Jardin des Plants, Refulgens, Madame Darrier, and Lord Wolseley. The Anemone varieties look well, the best new ones being Duchess of Westminster, Beauty of Eynsford, Gladys, and Sabine.—Bernard Cowan.

CHRYSANTHEMUMS AT THE CRYSTAL PALACE.

It may not be so generally known as it ought to be that one of the finest displays of Chrysanthemums now to be seen in or near the metropolis is at the Crystal Palace. As effective as the cut blooms and trained plants were at the Show there last week, they failed to make such a fine display as did the plants which had been grown at the Crystal Palace under the direction of Mr. W. G. Head, the Garden Superintendent. We are informed that 7000 plants are cultivated here, and so it may be imagined that these now form an attraction of no ordinary character.

The majority of the plants are arranged in a large group at one end of the central transept near the fountain, and here attract considerable notice. They are well grown and carrying flowers of a good size and substance. Whilst all the standard varieties are cultivated the novelties of the current year receive attention, and these are in excellent condition. In addition to the group mentioned there are many other smaller collections placed in various parts of the Palace, these imparting a bright appearance to the huge building. more could be said in regard to the excellence of the Crystal Palace Chrysanthemums, but space is valuable, and although brief, this notice will be sufficient to indicate that the plants are deserving of more than a passing glance.

CHRYSANTHEMUMS IN SOUTH WESTMORELAND.

DURING the last few years Chrysanthemums have been extensively cultivated for the production of large blooms in many private places in Westmoreland. The past season has been very favourable to many of the Japanese, but the incurved lack the refinement of last year.

At Dalton Hall, near Burton, Mr. Moorhouse has been a grower more than a dozen years, and his collection of about 300 plants does him great credit. New ones are tested each year. Among the best are Colonel W. B. Smith, John Dyer, and Felix Cassagneux, Florence Davis, R. C. Kingston, Alberic Lunden, and Sunflower. Among the incurved are, Robert Owen (which here resembles a poor Chevalier Domage), Mons. R. Bahuant (very fine), Madame Darrier, small but

At Dalton Tower Mr. Sarple has over 300 dwarf plants in one house. Gloire du Rocher, Miss Anna Hartshorn, W. Tricker, Viviand Morel (both pure white and deep mauve), Mdlle. Marie Hoste, Sunflower, W. Tricker, and J. Stanborough Dibben, are very fine, the same applying to Gloire du Rocher, which has long spreading florets resembling Sunflower in build. Among incurved Miss M. A. Haggas, the Queen family and Tecks are prominent.

Mr. McGregor of Brettorgh Holt, near Kendal, has some excellent flowers on the 350 plants grown. These included thirty plants of Bouquet des Dames, which made a fine show, Viviand Morel, W. H. Lincoln, Pelican, Miss Anna Hartshorn, W. Tricker, Mrs. E. W. Clark, Jeanne Delaux, are carrying exceptionally fine blooms; while of the incurved John Lambert, Lord Alcester, and Empress of India are fine. Mr. McGregor is of opinion that there are too many varieties grown generally, and maintains that if twenty or thirty plants of each of the very best varieties were grown a better display might be made.

At Sedgwick House many new varieties are grown, the most promising being Le Verseux, a refined Etoile de Lyon; Eda Prass, very fine; John Farwell, dark crimson maroon; Mrs. Nesbit, fine deep reflexed Japanese magenta with silvery reverse; Excelsior, incurved Jap.; Colonel W. B. Smith, very fine flowers; and Mrs. C. H. Payne, the largest of all. Among older varieties, Sunflower, Etoile de Lyon, W. H. Lincoln, Mrs. E. W. Clarke, E. Molyneux, and J. Stanborough Dibben are good. Incurved varieties are rough generally, but Madame Darrier and Mons. R. Bahuant are very fine. Many other new ones have promising buds, but this collection is later by a week or ten days

than any of the others, owing no doubt to the low-lying situation where the plants have been grown. About 400 plants are grown here for the production of large flowers, also a good number of bush plants.—W. S.

CHRYSANTHEMUMS AT MAIDENHEAD.

A FEW days since I paid a visit to Mr. R. Owen's nursery at Castle Hill, Maidenhead, to look over his collection of Chrysanthemums, and note a few of his most promising varieties. Several houses are filled with seedlings, and others with older and established named kinds. The whole stock is in a very flourishing condition; good eulture, together with the healthy and open position of the nursery, having much to do

with the sturdy and robust state of the plants.

Japanese varieties predominate, but a fair proportion of incurved, Anemones, and Pompons are also grown. On entering the first house Golden Avalanche was one of the most prominent to catch the eye, a seedling from the well-known white, having the dwarf and sturdy habit of the parent. A very fine seedling white, named Beauty of Maidenhead, is of large dimensions, long, waxy petals, the points incurved. James Myers is of a distinct rosy fawn colour, difficult to describe, and very good. W. H. Fowler is a good yellow, already exhibited. Viscountess Hambledon I noted was carrying some large blooms, and Mrs. Dene is another fine Japanese, colour silvery pink. Beauty of Exmouth is strongly in evidence, beautiful flowers on dwarf plants. Thomas Hewitt is another new variety, and in an adjoining house I observed a promising hirsute variety of a bronzy yellow colour, not fully open. It is impossible to mention all, and many seedlings have not yet received names. Many plants of Charles Davis, the sport from Viviand Morel, were in bloom, but corresponding in colour or petal with those certificated on October 11th, the flowers apparently being from terminal buds, and all of a bronzy red colour, and very little of yellow in it. Presumably the crown bud of strong plants produces the yellow flower, and one may still ask, Where is the real yellow Viviand Morel? The same remark applies to the so-called white sport Mrs. Wells; the terminal flowers are not pure white.

Of incurved varieties Brookleigh Gem was conspicuous; it is a lilac sport from Jeanne d'Arc, the flowers equalling that variety in size. Baron Hirsch is decidedly the greatest acquisition in this class, and will be sure to find a place in most prizewinning stands. Robert Petfield, a seedling from Princess of Wales, certificated, but not sent out yet, is of a silvery lilac colour, the type of its parent. Several exhibition blooms are now open. Lord Rosebery is an incurved of a dark plum colour, and a seedling partly expanded promised to equal in colour the well-known

Jardin des Plants.

Growing outside was an interesting display of October and early flowering kinds, an unusual show for the end of the month, several of the Japanese being worthy of mention—namely, Lord Hawke, rich claret; Harvest Home, chestnut red and gold; Golden Shower, very free; Snowflake, white; Gold-mine, bronze and gold; Profusion, these were all raised at Castle Hill. Others very good were the Pompons, including Inimitable, Pomponium, Madame Edouard Lefort, Viscount Clicquot, Souvenir de Louis Ferie, M. A. Herlaut, and La Vierge.—VISITOR.

AT THE ROYAL GARDENS, WINDSOR.

THE collection of Chrysanthemums at the Royal Gardens, Windsor, may be truly termed a royal one, comprising, as it does, all the latest may be truly termed a royal one, comprising, as it does, all the latest introductions, and many of the best of the older varieties. There are in all upwards of 4000 plants grown, and Mr. Thomas, the well known gardener, estimates that he will have almost equally as fine a display at Christmas as he has now. The display is a magnificent one, rich in colour, and splendid flowers. The plants are not arranged in one structure, but are placed in almost all the cooler houses in the gardens. Some are in full bloom, while others are only just showing their buds. Amongst these latter must be mentioned a number of small plants in 6-inch pots grown from cuttings rooted in strong heat during the month of June, and which are now sturdy little specimens. They will come in admirably for decorative purposes and for supplying cut blooms, though for this latter purpose Mr. Thomas has a large number of plants planted out in a border. All the plants are well grown and carrying stout foliage, in almost all cases right down to the pots. Flowers are numerous, and as has been said before, highly coloured, there being an average of half a dozen blooms to each plant. This remark applies of course to the large flowered sections, and not to those grown for purposes of decoration or for affording a supply of cut flowers.

From amongst the varieties in bloom at the present time a few of the very best have been selected and are mentioned here. Immediately on entering the structure in which the earliest plants are shown is a superb bloom of Wm. Seward of exceptional size and perfect form. Avalanche, though an old variety, holds its own well with some of the later introductions as also does the bright yellow Sunflower. Colonel W. B. Smith is represented by several grand flowers, the colour in many being a rich old gold. A beautiful variety is found in Brocklebank Improved, the colour of which is a charmingly delicate straw. J. W. Penny is a chaste flower with narrow pure white florets which render it most attractive amongst its more substantial looking neighbours. Some grand flowers of the well known Baron Hirsch are prominent, and the same may be said of the elaret-coloured R. C. Kingston. Puritan is a very beautiful variety which is deservedly popular, as also is Gloire du Rocher, of which there are some exceptionally good examples. Chas. E. Shea is a refined looking flower of a pale lemon yellow tint, and Annie Clibran may be placed amongst the first of the pinks. Hairy petalled

varieties are not numerous but of unusual quality, more especially of the Louis Boehmer type, of which the white variety is decidedly the best. Excelsior is a pleasing variety with bright magenta florets, having a silvery reflex. Bouquet des Dames appears to be unusually good everywhere this season, some blooms at Windsor being perfect

in their symmetry.

Miss Anna Hartzhorn is represented by some superb flowers, as also is Comte de Germiny, which is, however, rather paler in colour than it is generally scen. Duchess of Devonshire is a really fine flower, which should become popular, the blooms having a delicately refined appearance which is most pleasing. The colour is a charming shade of pink. Primrose League is a superb variety, the outer florets being nearly white, a centre of pale primrose; the flowers are large in size, and of a handsome shape. Condor, with its broad pure white florets, is deservedly popular, as also is Elwin Molyneux. A pale lemon-coloured variety, named Emily Dale Improved, is very beautiful; and W. A. Manda, with its bright yellow hairy petals, is amongst the most showy. Wm. Tricker is to be seen in perfect form, as also are Gloriosum, G. W. Childs, and Richard Parker. An attractive variety is to be seen in Moonlight, which is white, tinged with sulphur in colour. Madame J. Laing is a bright rose coloured flower of splendid shape, and the bronze blooms of the well-known Lord Brooke were very fine. A good salmon-tinted kind is Lilian B. Bird, and for a brick red Masterpiece will be difficult to supersede. A curious flower is seen on a plant of Madame R. Owen, one half being pure white, and the remainder deep lilac. The bloom was perfect in shape, and others on the plant had retained their normal colour. Amongst the numerous others noticed were Ada Spaulding, Mr. A. H. Neve, Edwin Lonsdale, Mdlle. Marie Hoste, Mrs. Heale, Madame Cabriol, Eynsford White, F. A. Davis, and Robt. Cannell. A large flower of Viviand Morel measured 13 inches diameter, which will serve to illustrate the admirable manner in which the plants have been grown. It must not be thought that those above mentioned represent the varieties cultivated at Windsor, for such is not the case. There are dozens of others perhaps equally as good, but of which special mention account he was a Normal and Norm of which special mention cannot be made. - NOMAD.

EARLY AND SEMI-EARLY FLOWERING CHRYSANTHEMUMS.

NOTWITHSTANDING the admitted general depression in trade, the progress of the Chrysanthemum is great, and the early and semi-early varieties enjoy their full share in this advance. The summer of 1893 has been one of such exceptional length and sunshine that it is a chance if many persons will see the like in England again. Its effects on all vegetation has been most marked, not only due to its length and brightness, but by its long period of absence of rain. Where Chrysanthemums have been planted in the open gardens or fields where they could not be sufficiently watered, their flowers, even after the rain did come, have frequently proved abortive, and even in many cases where they were grown in pots and sufficiently watered and manured the blooms have come with what growers call a "weedy eye." I have noticed this particularly in the two crimson sorts—viz, Roi des Précoces and Ruby King, which latter, in most seasons, quite fills up and covers any slight weedy eye that does exist. It seems, like many other cases in which Nature appears to fear for the existence of the race, that extra effort is made for its perpetuation, though, as far as I can sec, this has not been a good season for the growth of seed in this country of the Chrysanthemum.

Another curious result of the season has been that in July many varieties came into bloom that should in usual seasons have been a month later. Thus at the end of July I had twenty-two sorts in bloom, and at the end of October some were only then in flower that in ordinary years would have done so a month before, so that in July the scason was a month in advance of usual summers, and at the end of October it was in some cases a month behind. Then some varieties have bloomed twice in the season. White Lady, Strathmeath, and Dodo did so, and Blushing Bride has even bloomed three times. Of course in all these cases I am speaking of plants grown naturally, not disbudded or cut down in any way. Many plants through their thorough ripening and maturity have produced vast masses of flowers, even more than they usually do.

At the first Show at the Aquarium at Westminster on September 6th the most striking feature as regards early flowering Chrysanthemums were two exhibits of twenty-four bunches in twenty-four varieties. These exhibits were quite typical of two different modes of growing, and equally meritorious in their way. The blooms in one stand were probably grown entirely in the open air and naturally, while those in the other exemplified disbudding and finish under glass. Certificates were awarded on that day for a variety named Mr. Barlow, and for a new yellow kind named Edwin Rowbottom. I do not mention here the many other varieties exhibited at this and the second Show, because many were merely late varieties, grown early by taking the first bud or other means. At the second Show at the Aquarium on October the 11th a plant of Lady Fitzwygram, the new white early sort, was exhibited, also several plants of Ryecroft Glory, the new yellow. A group, mostly

composed of Piercy's Seedling, was likewise exhibited.

It may perhaps be well here to mention that the splendid early October variety Comtessee Foucher de Careil has become one of the greatest market varieties sold in various forms. Fine plants have been exposed for sale in 48-size pots. It has been called Source d'Or, but the latter variety eaunot be had nearly so early, neither is it so manageable a plant, being very tall and much less profuse in flowering. Gustave Grunerwald, not Grundelwald as I have seen it spelt, is the name of the Emperor of Russia's gardener at the Gatschine Palace in

Russia. This plant is already in the hands of one or more large market but perhaps will not be a common flower for some time, as it rather more delicate than some, and not so profuse a bloomer as many, but for high-class trade it must take a place, because it is the most beautiful very early variety. It was figured in the Journal of Horticulture

for August 18th, 1392.

Of new sorts I must put first Ryecroft Glory, to which allusion has already been made. It is the very finest semi-early yellow, as it does not really fully bloom till the middle of October. It has nearly every good quality for a plant in its line. It is stout and dwarf, $2\frac{1}{2}$ to 3 feet high, and if disbudded will give flowers $3\frac{1}{2}$ to 4 inches across, of a rich golden yellow colour. If grown naturally it produces a mass of bloom. It is good for propagation, and if cuttings are rooted in the middle of May the plants will bloom at the end of October, doing well in small pots. It is a real advance on any we have had before of its colour, and is useful not only as a decorative plant but for providing cut flowers. Another variety which deserves mention is Gloire de Mezin. This was raised in France, and sent over here in 1891, but although I grew it last yerr I did not discover its great merits. It is called a red crimson, but it seems more appropriately to be considered a red bronze. It is a reflexed flower, and grows without disbudding 4 inches across. The plant grows 3 feet 6 inches high, with dark massive foliage, and it also bears fine massive tufts of flowers which are a wonder to see. It is very good for propagation, and is an excellent variety in every respect. It blooms in the middle of October, and can be had up to the end of that month, making it in most scasons a fine open garden plant.

Madame Marie Massé is another sent over from France in 1891. is an excellent variety, very early, and will bloom from a cutting put in at the beginning of May at the end of August. It starts with three or four blooms, after which it shoots out from below these, and blooms right on into October. It grows rather over 2 feet high with a stout habit. The flowers are reflexed Japanese, in colour of a pale magenta to mauve; very good for propagation. Orange Child was raised here in 1891 from seed said to be of Source d'Or, grown in America. It is an excellent variety, somewhat resembling the yellow sports of Madame Desgrange, but of better habit, inasmuch as the separate flower stalks are longer, thus enabling the flowers to come out witbout disbudding. It is a profuse blooming Japanese with orange yellow flowers $3\frac{1}{2}$ inches across. Grows $2\frac{1}{3}$ feet high and stout, requiring no sticks to support it. Blooms in September, and has a moderate foliage. It has the advantage that all the flowers can be cut at one time, and the plant

put out of the way.

Montague is a seedling of my own, raised from American seed. It grows 4 feet high with a fine open habit, spare foliage, and stout wood. The flowers are 4 inches across, reflexed Japanese; rich purple crimson in colour. It does well without disbudding. Blooms at the beginning of October, and is one of the best of its colour that flowers at that period. Another seedling of my own raising is American Star. This is a model for stoutness of habit and profuseness of blooming. It grows only 2 feet high, being so stout that it requires no sticks, but covers itself with a perfect mass of white flowers 2 to 3 inches across, slightly flushed and pinkish colour. This is grown from American seed.

Another seedling named Maria grows a little over 3 feet high with flowers 21 inches across, colour mauve, which come in a solid mass of profusion all over the top of the plant. They are of Japanese form, stand well, and are borne on stalks which make them most convenient for cutting. A great number of flowers can be produced on a small space of ground. They come to full perfection in September. Early Beauty is a seedling from American seed. Flowers mauve, rather reflexed, 3 inches across. The plant has a bushy habit, and keeps on blooming from September to October. Mrs. Gifford is a beautiful silvery white Japanese seedling. The plant grows 3 to 4 feet high with a thin habit. The flowers are 3 inches across, and produced in October. Florie Parsons is a mauve reflexed Pompon 18 inches to 2 feet high, flowers 3 inches across. A continuous bloomer during September and October. Mdlle. Marguerite Puisaye was sent from France in 1891, but is very little known. It is a remarkably dwarf plant, requiring no sticks, growing only 2 to 2½ feet high, with fine Japanese flowers 3 to 4 inches across. It is termed a red brown, but we may set it down as a bronze. It is an admirable plant, can be had in bloom from September to October, at which latter time it will flower if rooted at the beginning of May. It is a profuse bloomer, covering itself with flowers, and a plant of very handsome form.

Lady Fitzwygram has not come up to my expectations of it last son. Like so many others, when all the buds but some five or six are taken off, it is good, but disappointing when they are all left on; then the flowers are certainly most numerous but small, and weak in the stalks, which are too short to make the flowers generally available for cutting. To grow the flowers a fair size the plant requires vigorous cutting and thinning-out, as well as disbudding. Another way to manage it is to root cuttings late, say 1st of May; then grow the plants in small pots, the produce moderate sized blooms. clusion I may mention that Mdlle. Rence Cohn has quite come up to my good opinion of it last season. It is excellent as a decorative plant or for cut flowers. As a pink Japanese it comes before pink Mdlle, Lacroix, but not to be confounded with Madame Léon Cohn, which I have found to be inferior to the above. Other growers and myself have many good seedlings and we can hope the time is not far distant that the early varieties may receive the addition of one equal in colour and habit to the unsurpassed crimson late one, William Seward.
—W. Piercy, Beadnell Road, Forest Hill, London, S.E.

CHRYSANTHEMUM SHOWS.

HORSHAM.-OCTOBER 31ST AND NOVEMBER 1ST.

THE fourth annual Exhibition of the Horsham Chrysanthemum Society was held on Tuesday and Wednesday, October 31st and November 1st, at the Assembly Rooms, and proved to be equal to any of its predecessors. Five good groups were arranged, the chief honour being won by Mr. A. Haskell, Slinfold. Mr. G. Marshall was a good second, Mr. E. Daniels third, Mr. J. Salter fourth, and Mr. S. Charman fifth.

In the open class for cut blooms some spirited competition resulted. For twenty-four Japanese blooms, distinct, Mr. G. Duncan of Warnham Court won with splendid flowers, massive and bright. The best were Viviand Morel, John Dyer, Miss A. Hartshorn, Colonel W. B. Smith, W. H. Lincoln, W. Seward, Edwin Molyneux, Lilian B. Bird, Wm. Tricker, and Etoile de Lyon. Mr. W. Wallis, Hartfeld, was second; his best blooms were John Shrimpton, G. C. Schwabe, and Mrs. E. W. Clarke. Mr. T. Sparks, Wimblehurst, was third with fine and even blooms. For twelve Japanese Mr. E. Lawrence was first, Mr. J. W. Harris second, and Mr. E. Daniels third. With six Japanese, one variety, Mr. T. Dauncey staged six faultless Viviand Morel; Mr. Duncan followed with Avalanche, and Mr. J. W. Harris third. For one bloom of any Japanese Mr. J. Coles put up a grand Colonel W. B. Smith, Mr. Sparks followed with Mons. E. A. Carrière, and Mr. H. Harris with Molle. Marie Hoste.

In the class for twenty-four incurved blooms of not less than eighteen varieties Mr. T. Sparkes had a grand even box of all the leading varieties, and was a good first. Mr. Goldsmith, Leonardslee, was second, and Mr. Wallis third. For twelve incurved, distinct, Mr. E. Daniels was first, Mr. H. Harris second, and Mr. J. W. Harris third. With six incurved, Mr. E. Lawrence, G. Duncan, and G. Goldsmith scored; and in the single bloom, incurved, the winners were Messrs. Goldsmith, Sparkes, and Wallis.

For six Anemones Mr. H. Harris won with a good box of Jean Marty, Delaware, Mrs. Judge Benedict, Lady Margaret, Grand Alveole, and Mrs. Leven. Mr. T. Sparkes was second, and Mr. Dauncey third. With six reflexed Mr. H. Harris again scored first, Messrs. Sparkes and Lawrence following. Mr. T. Sparkes led with twelve Pompons, a fine box. Messrs. H. Harris and E. Lawrence followed. In a mixed class for twelve Japs and twelve incurved Mr. G. Goldsmith was first, Mr. G. Duncan second, and Mr. J. Sparkes third, all showing well the leading varieties of both sections. Classes were provided for the ladies for baskets, sprays, and bouquets. Miss Willison, Mrs. A. Aldridge, Mrs. Stott, and Mrs. Champion secured the prizes amongst them for some very pretty arrangements. A few classes were provided for amateurs, and the prizes were won by Messrs. Charman, Stott, Champion, and others.

Fruit was well shown, and prizes won by the following: Black Grapes, Messrs. Duncan, Laurence and Le Pelley; White Grapes: Messrs. Dauncey, Duncan and A. Kemp; Pears, Dessert: Messrs. Messrs. Duncan, Laurence and Le Pelley; White Grapes; Messrs. Dauncey, Duncan and A. Kemp; Pears, Dessert: Messrs. Goldsmith, Duncan and Webb; Pears, Stewing: Messrs. Goldsmith, Kemp and Daniels; Apples, Cooking: Messrs. Goldsmith, H. Harris and Webb; Apples, Dessert; Messrs. Kcmp, Coles and H. Harris. Six varieties of vegetables, the prizes given by Messrs. Sutton & Sons, brought five fine collections; Messrs. Lawrence. Sparkes and H. Harris winning in the order named.

winning in the order named.

Mr. T. Sparkes sent some beautifully trained plants of Chrysanthemums, not for competition, these were much admired and were one

of the features of the Show.

The Secretaries, Mr. S. Mitchell and Mr. G. W. Taylor, and the Committee deserve a word of praise for the excellent arrangements made and for the results achieved.

EWELL.-NOVEMBER 2ND.

To recoup a loss on the late summer Exhibition of some £10, the local Horticultural Society resolved to hold a first Chrysanthemum Show this season, and it took place at the Public Hall on November 2nd. All exhibits were honorary so far that whilst a schedule was issued and classes formed, the competition was restricted to certificates of three classes, and these, of a very handsome character in three colours, were much prized. The Show, though small, was so good that it merits very high praise, especially that the exhibitors could not have any pecuniary

Three fine groups of Chrysanthemums were staged, the best coming from Mr. Ewinton, gardener to Sir David Evans, whose arrangement and flowers were both excellent. The second best, showing many good cut bunches for the front rows, was shown by Mr. Whiteman, gardener to A. W. Gaddesden, Esq.; Mr. Elsey, gardener to Miss Carlisle, being third. Then in the mixed group class Mr. Whiteman was first with a charming collection, Mr. Elsey being second, Mr. Ewinton and Mr.

Worsfold, gardener to Lady Glynn, being equal third.

Mr. Whiteman had the best six Bouvardias, really fine well bloomed plants; also six best berried plants, the Giant Red Capsicum being very finely fruited. The finest six double Primulas in four large flowered sorts came from Mr. Ewinton, all well grown, also the best singles. Mr. Whiteman had handsome Zonal Pelargoniums, and showed a fine collection of winter flowering plants, including Salvias, blue and scarlet Cypripediums, Chrysanthemums, Eupatoriums, Heaths, and Begonias. Cut flowers were few and only fairly good. Fruit was very good, Mr. Ewinton having the best Grapes, Mr. Whiteman the best six dishes of fruit, Mr. Elsey the finest three dishes of Pears, and Mr.

Ewinton the best of Apples. There were good Tomatoes, flowers in baskets, epergnes, and numerous other exhibits, all helping to make a

November 9, 1893.]

very pretty show.

HIGHGATE.-NOVEMBER 2ND AND 3RD.

THE ninth annual Exhibition of the Highgate and District Chrysanthemum Society was held in the Northfield Hall, Highgate, on the above dates. As a local Exhibition this has for many years been regarded as a very good one, and the present year's Show proved no exception to the rule. The cut blooms formed the principal feature, although groups

Mr. J. Brookes, gardener to W. Reynolds, Esq, J.P., The Grove, Highgate, was second with larger but rather coarse flowers. Mr. S. J. Cook, Hendon, was third. Mr. Turk, gardener to T. Boney, Esq., Cholmondeley Lodge, was first with twelve incurved blooms in a special class; Mr. A. Page, Priory House, New Southgate, being second. For six blooms of any one incurved variety Mr. J. Brooks secured the leading prize with a stand of Madame Darrier in fine condition. Mr. Rowbottom followed closely, and Mr. H. A. Page was third. The last-named exhibitor, however, won the special prize, given by Mrs. H. R. Williams, for twelve incurved blooms. Mr. Rowbottom was a close second with well-grown

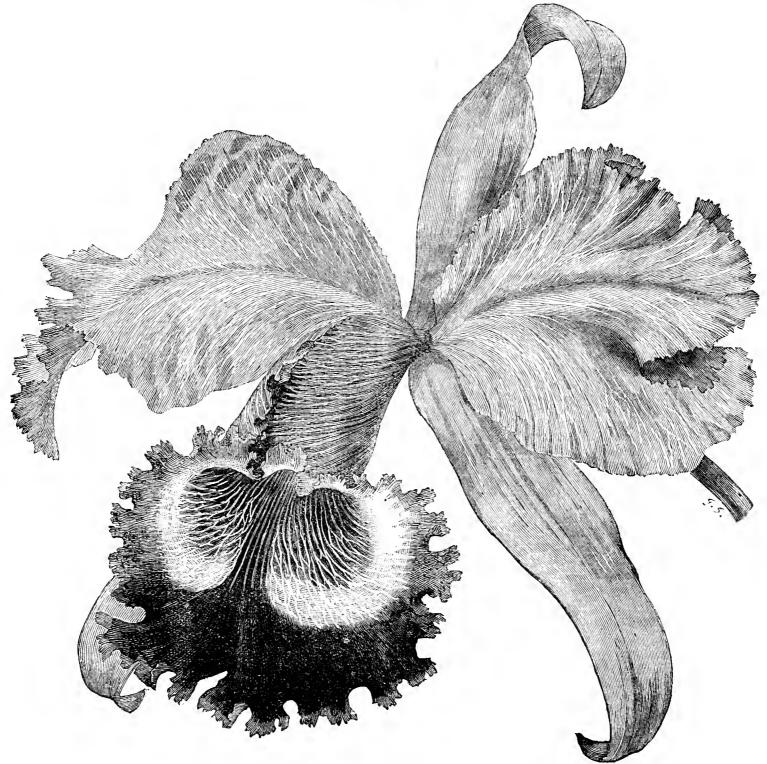

FIG. 62.—CATTLEYA LORD ROTHSCHILD. (See page 417.)

and plants were fairly well represented. Fruit and vegetables were also staged, but further reference to these cannot be made. The exhibits were very much erowded, which detracted considerably from the show as a whole. We append the names of the leading prizewinners in the classes provided for Chrysanthemums.

One of the principal classes in the cut bloom section was for twenty-four Japanese varieties, distinct. Mr. E. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey, succeeded in winning the first prize. His blooms were in splendid condition, being large and well finished. The varieties were Mrs. C. H. Payne, Mrs. Falconer Jameson, Mdlle. Marie Hoste, E. Molyneux, Kentish Yellow, Alberie Lunden, W. Tricker, Avalanche, W. H. Atkinson, Gloire de Rocher, Golden Dragon, Utopia, Excelsior, Souvenir de la Malmaison, Col. W. B. Smith, Ada Prass, Chas. Davis, Edith Rowbottom, G. C. Schwabe, President Borcl, Sunflower, Viviand Morel, Miss Dorothy Shea, and Madame Thérèse Rey. Mr. J. Sandford, gardener to G. W. Wright-Ingle, Esq., Woodhouse, Finehley, was second with smaller flowers.

The incurved blooms were very good. Mr. J. Bureh, gardener to J. Smith, Esq., The Priory, Mill Hill, was placed first for twelve blooms, comprising Hero of Stoke Newington, Violet Tomlin, Princess of Teck, Princess of Wales, Novelty, Refulgens, Prince Alfred, Lady Dorothy, Madame Darrier, Alfred Lynn, Jeanne d'Arc, and Camille Flammarion.

specimens; and Mr. H. W. Hawker, Westerham, Kent, was third. A special prize was offered for thirty-six blooms, distinct, half to be incurved and the rest Japanese. There were three exhibitors in this class, and the competition was keen. Mr. J. H. Walker, gardener to J. Marshall, Esq., Goldbeater, Mill Mill, was placed first with a stand of grand blooms. The incurves were well finished, especially Mrs. Heale, Prince Alfred, Violet Tomlin, Madame Darrier, and Golden Empress. The best of the Japanese varieties were J. Stanborough Dibbens, Puritan, W. Tricker, Gloire de Rocher, W. H. Lincoln, Sarah Owen, Mdlle, Marie Hoste, and Col. W. B. Smith. Mr. E. Rowbottom was a very close second, the third prize going to Mr. J. Burch. Mr. Rowbottom secured the leading award for six blooms of one Japanese variety with a stand of magnificent examples of Col. W. B. Smith. These were the finest blooms we have seen this season. Mr. W. Hawker was second with blooms of W. Tricker.

A feature of the Show was a standard of twelve bunches of Chrysanthemums, arranged with foliage for effect. Mr. E. Rowbottom won the first prize with a charming arrangement. Mr. D. M. Hayter, gardener to W. Hannsford, Esq., Hendon, was second, and Mr. G. Quelch, Shepherd's Hill, was third. Mr. Sandford was placed first for six Japanese blooms, distinct, in a special class, Mr. A. Page being second. Mr. E. Linfield had the best six white Japanese in the amateurs' class,

Mr. Rowbottom gaining a similar position in the open class, both showing well grown blooms. The last named exhibitor was first for twelve Japanese blooms in a special class, Mr. Brooks occupying a similar position in another class. As before remarked, groups and specimen plants were fairly good, but the exhibits were so arranged as to render it impossible to distinguish the names of the prizewinners. For a group of Chrysanthemums Mr. J. Brookes was awarded the first prize.

Miscellaneous exhibits included a group of plants from Messrs. B. S. Williams & Son, Upper Holloway; a collection of fruit and vegetables from Messrs. W. Cutbush & Sons, Highgate; cut Chrysanthemum blooms from Mr. W. E. Boyce, Archway Road, Highgate; and some boilers from Messrs. Pearce & Heatley, Holloway Road, N. The amateurs' and cottagers' classes were well filled, and there were numerous baskets and epergnes filled with Chrysanthemums.

CRYSTAL PALACE .-- NOVEMBER 3RD AND 4TH.

AN Exhibition of Chrysanthemums was held at the Crystal Palace on the above dates, and as is usual on such occasions the produce staged was of excellent quality. Some of the classes were well filled, and the competition generally keen, the leading southern growers been repre-The Japanese blooms were splendid, being large, but not coarse, and well coloured. There were perhaps a few exceptions, but the foregoing remarks may be applied to the blooms in the leading stands. Taken as a whole the incurved blooms were also exhibited in excellent condition, especially in the principal stands; but in a few instances some rather rough ones were noticeable. The Anemone flowered varieties were exceedingly good, although not very extensively shown, the same applying to the Pompons. In two or three classes there were but few entries, and consequently some spare tabling was conspicuous. Trained plants were well shown, as also were the groups, some blooms on the plants being remarkably fine.

The principal class was for forty-eight blooms, twenty-four incurved twenty-four Japanese, not less than eighteen varieties of each, or more than two of one variety, for which the following prizes were offered: £10 first, £7 second, £5 third, £3 fourth. There were seven exhibitors, and the competition was very keen. As an example of this those veteran growers who have so many times in past years held the first prizes, Messrs. Drover, Fareham, were in this case placed fourth. coveted award fell to Mr. C. Ritchings, gardener to Dr. Frankland, The Yews, Reigate Hill, for an exquisite collection, the Japanese being massive, bright, and as fresh as it is possible to stage them. The incurved blooms were models of neatness, and seldom have we seen such fine flowers of the Rundle family as were staged in the front row of this exhibit. His Japanese blooms were staged as follows:—Colonel W. B. Smith, Edwin Molyneux, Viviand Morel (fine colour), W. H. Lincoln (good); Mrs. Harman Payne, John Shrimpton (fine), and the acme of brightness; Viviand Morel, Colonel W. B. Smith, Puritan, President Borel, Gloire du Rocher, W. H. Lincoln, Beauty of Exmouth, Edwin Molyneux, W. Seward, Sunflower, W. Tricker, W. H. Atkinson, Florence Davis, Excelsior, W. Seward, and Avalanche. Incurved: Baron Hirsch, Empress of India, Violet Tomlin, Madame Darrier, Empress of India, Prince Alfred, Baron Hirsch, Jeanne d'Arc, Queen of England, Madame Darrier (good), Princess of Wales, Violet Tomlin, Miss M. A. Haggas, Lord Wolseley, Jeanne d'Arc, Lady Hardinge (fine), Nil Desperandum, Mrs. G. Rundle, Mrs. Dixon, George Cockburn, Princess Beatrice, Cherub, and Mrs. G. Rundle. Mr. H. Shoesmith, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, was awarded the second prize for a very good collection. The Japanese were brighter than the rest and so keen did the third prize run him that it was not until con-The Japanese were brighter than the siderable amount of minute examination and pointing had been resorted to by the judges that the awards were made, only two points separating the second and third prize collections. Mr. Shocsmith's best Japanese were Edwin Molyneux, Viviand Morel, Col. W. B. Smith, Eda Prass, Charles Davis, Mdlle. Thérèse Rey, and a white Viviand Morel, which, as exhibited, is a distinct and appreciative variety. Mr. J. C. Salter, gardener to T. B. Haywood, Esq, Woodhatch Lodge, Reigate, was third. Excelsior, Charles Davis, Mdlle. Marie Hoste and Colonel W. B. Smith were amongst the best Japanese. Princess of Wales and Baron Hirsch were fine amongst the incurved in this stand. Messrs. W. G. Drover, Fareham, Hants, as before remarked, were placed fourth. The Japanese were somewhat weaker than the others and scarcely up to their usual brightness in colour; their incurved varieties were on the whole neat but a little flat.

In the class for eighteen incurved varieties, distinct, there were ten competitors, and Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park Gardens, New Barnet, outdistanced the others with one of best and most even stands that could be staged. The blooms in the front row were as perfect both in size and form as those at the back. The varieties comprised Mons. R. Bahuant, Queen of England, Alfred Salter, Lord Alcester (magnificent), Lord Wolseley, Empress of India, Mrs. Coleman (good), Hero of Stoke Newington, Princess of Wales, John Doughty, Violet Tomlin, Jeanne d'Arc (grand), Madame Darrier, Alfred Lyne (good), Golden Empress of India, Princess Beatrice, and Miss Mr. George Carpenter, gardener to Major Collis Browne, Byfleet, was awarded the second place, Jeanne d'Arc and Madame Darrier being his finest blooms. Messrs. W. & G. Drover were third, and Mr. C. W. Knowles, gardener to Mrs. C. Egerton, Roehampton, fourth. For twelve incurved varieties, distinct, Mr. A. Felgate, gardener to Her Grace (Elizabeth) the Duchess of Wellington, Burhill, Waltonon-Thames, was placed first in the eight collections staged. The varieties were Mrs. Heale, Madame Darrier, Queen of England, Mons. R.

Bahuant, Princess of Wales, Noel Pragnell, Lord Wolseley, Jeanne d'Arc, Miss M. A. Haggas, Violet Tomlin, Eve, and Mrs. Coleman. Mr. W. Jupp, gardener to G. Boulton, Esq., Torfield, Eastbourne, was placed second, Mr. A. Turner, gardener to C. F. Murray, Esq., Woodcote Hall, Epsom, third, and Mr. T. Robinson, gardener to W. Lawrence, Esq., Elsfield Gardens, Maidstone, fourth. For six incurved, one variety, nine collections were staged, and Mr. Brown, gardener to A. B. Welch-Thornton, Esq., Beaupairc Park, Basingstoke, was placed first with six good blooms of Mons. R. Bahuant. Mr. W. Jupp was second with Princess Mr. George Goldsmith, gardener to Sir E. Loder, Bart., Horsham, third with Madame Darrier; and Mr. George Carpenter fourth with Prince Alfred.

No less than fifteen competed in the class for eighteen Japanese, distinct, the premier award falling to Mr. Lees with Viviand Morel, Stanstead White, Mr. C. Bryceson, Florence Davis, Edwin Molyneux, Condor, Sunflower, Charles Davis, Mr. F. Jameson, Madame E. Carrière (a magnificent flower), Col. W. B. Smith, G. C. Schwabe, Avalanche, Gloire du Rocher, W. Tricker, H. W. Lincoln, and Puritan. Messrs. W. & G. Drover were second; Mr. Charles Cox, gardener to J. Trotter, Esq., Brickenden Grange. Hertford, third; and Mr. Carpenter fourth. For twelve Japanese, distinct, there were twelve competitors, and Mr. E. Tickner, gardener to J. Watney, Esq., Shermanbury House, Reigate, won the premier position with Col. W. B. Smith, Violet Rose, W. H. Lincoln, Viviand Morel, Mdlle. Marie Hoste, Edwin Molyneux, President Borel, G. C. Schwabe, W. Tricker, Puritan, Lord Brooke, and Avalanche. Mr. A. Felgate; Mr. J. Harwood, gardener to A. J. Jack, Esq., Brightlands, Reigate; and Mr. W. Howe, gardener to H. Tate, Esq., Park Hill, Streatham Common, were placed second, third, and fourth respectively in the order of their names.

There were eleven exhibitors in the class for six blooms of one Japanese variety, and the competition was naturally very keen. The premier award, however, went to Mr. J. MacDonald, gardener to Captain Manling, Clanna, Sydney, Gloucester, who staged half a dozen splendid blooms of Edwin Molyneux. Mr. A. Felgate was second with exceedingly good Col. W. B. Smith. Mr. W. J. Owden, gardener to A. Morris, Esq., Court Green, Streatham, was third with Viviand Morel, and Mr. Chas. Cox, gardener to J. Trotter, Esq., Brickenden Grange, Hertford, was fourth with Stanstead White. In the class for eighteen reflexed and Japanese reflexed blooms there were three competitors. Mr. C. J. Salter secured the first prize for a stand of fine even flowers. These varieties were Wm. Seward, Eynsford White, Phidias, Elaine, Rosy Morn, J. Shrimpton, Edwin Becket, Mrs. Sullivan, Criterion, Gloire de Rocher, Maiden's Blush, Madame Prunal, La Triomphante, Ernest Asinils, Mons. Jules Chrêtien, Jeanne Delaux, and Emperor of Chiua. The second prize went to Mr. A. Felgate, and the third to Mr. C. Ritchings, Reigate Hill.

With eighteen blooms of Anemone and Japanese Anemone-flowered varieties there were seven exhibitors, and the competition was keen. Mr. C. J. Salter was first with Delaware, Ruche Toulous.ine, Mrs. Judge Benedict, Grand Alveole, Nouvelle Alveole, Annie Lowe, Minnie Chate, Lady Margaret, Acquisition, Cincinnati, Mons. Lebosqz, Duchess of Westminster, Sabine, Sœur Dorothée Souille, La Marguerite, Thorpe Junior, George Sands, and Gluck. Mr. J. Milner, gardener to Mrs. W. A. Higgs, Barnet, Herts, was second; Mr. R. C. Notcutt, Ipswich, third, and Mr. H. Harris fourth. Only one exhibitor was forthcoming in the class for twelve blooms of Japanese Anemone flowered varieties, but no award was made, as the stand contained two large flowered Anemones.

Four exhibitors competed in the class for twelve Pompons, distinct, three blooms of each. Mr. J. Knapp, gardener to F. W. Amsden, Esq., 22, Chichester Road, Croydon, secured the premier award for a stand of neat blooms. The best varieties were Perle des Beautés, Prince of Orange, Golden Madame Martha, Black Douglas, Florence Carr, and best varieties were Perle des Beautés, Prince Mdlle. Elise Dordan. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was second, and Mr. H. Harris, gardener to Mrs. Eversfield, Deene Park, Horsham, third. For twelve bunches of Anemone Pompons Mr. Salter was first, showing Aglaia, Antonius, Brightness, Madame Montel, Perle, Emily Rowbottom, Breolus, Madame Senter, Regulus, Mr. Astie, Bessie Flight, and Marguerite de Coi. Mr. Harris followed, and Mr. Knapp was third. There was only one exhibitor of twelve bunches of single Chrysanthemums, this being Mr. Geo. Carpenter, gardener to Major Collis Browne, Broad Oaks, Byfleet, but to whom the first prize was deservedly awarded. The flowers staged were delightfully fresh and formed a pleasing contrast to the other varieties. It is a pity these graceful Chrysanthemums are not more generally grown. The varieties staged by Mr. Carpenter were Bessie Conway, Miss Cripsly, Mrs. D. B. Crane, Sir T. Symons, Miss M. Wilde, Miss Mary Anderson, Rev. Rewfrey, Purity, Yellow Jane, Oceana, Lady Churchill, and Jane.

For a collection of Chrysanthemums in pots arranged for effect in a group not less than 50 feet square, and open to amateurs only, Mr. T. W. Wells, gardener to C. Ralph, Esq., Cranbrook Villa, Fox Lane, Upper Norwood, was placed first. This group was well arranged as regards colour, the plants also being dwarf and the blooms of a fair size. Mr. D. Baker, gardener to C. J. W. Rabbits, Esq., Westwood House, Sydenham, was a close second, the plants in this case being rather more crowded than in the first prize exhibit. They were nevertheless well arranged otherwise, and carried fine blooms. Mr. James Fry, gardener to W. Aste, Esq., Hill House, Sydenham, was third. There were two competitors in the open class for a collection of Japanese varieties only arranged for effect in a group of not less than 100 square feet. The firs

prize went to Messrs. J. Carter & Co., High Holborn, for a splendid group, comprising the leading varieties in excellent condition. Messrs. Mobsby & Son, 147, Moffat Road, Thornton Heath, were second. There was apparently only one exhibitor in the class for a group of incurved varieties, to be faced with Pompons and ornamental foliage plants. This was Mr. A. W. Young, 157, Holmesdale Road, South

Norwood, to whom the fourth prize was awarded.

Mr. J. Hughes, gardener to G. R. Higgins, Esq., Eastlands, Dulwich Village, was first for six trained specimens of Pompon varieties, showing Golden, Lilac and White Cedo Nullis, Saint Justin, Mabel (a yellow sport from Saint Justin), and Maroon Model in good condition. Mr. W. Wesker, gardener to A. Heaver, Esq., Upper Tooting, was second, and Mr. W. Carr, Croydon, third. Mr. Hughes was also first for six trained specimens of incurved varieties. The best of these were Mrs. G. Glenny, Mrs. Dixon, Prince Alfred, Mrs. G. Rundle, and Lord Wolseley, in grand condition. Mr. E. Cherry, gardener to Mrs. Gabriel, Norfolk House, Streatham, was second. Mr. Hughes repeated his success with six trained Japanese varieties, the finest of these being Margot, Stanstead Surprise, Cleopatra, and Viviand Morel. Mr. Wesker was second, and Mr. E. Cherry third. Mr. W. Carr secured the first prize for nine standard trained specimens with Mrs. G. Rundle, Alberic Lunden, Golden Madame Martha, Mrs. Dixon, Black Douglas, Elaine, Margot, Source d'Or, Mrs. G. Glenny, White Cedo Nulli, and Novelty. Mr. G. H. Cooper was second, and Mr. Carpenter third.

Miscellaneous exhibits were not so plentiful as we have seen them at the Crystal Palace. Mr. W. Wells, Earlswood Nursery, Redhill, staged a fine group of Chrysanthemums, also some splendid cut blooms of all the leading varieties. Messrs. W. Cutbush & Sons, Highgate, sen to box of blooms of Mrs. Leopold de Rothschild Carnation, a useful variety, which produces its charming pink flowers in the winter as well as in the summer. Messrs. J. Laing & Sons staged a group of flowering and ornamental foliaged plants not for competition, and some well grown blooms of Chrysanthemums, including the latest novelties. Mr. W. J. Godfrey, Exmouth, sent blooms of Beauty of Exmouth Chrysanthemum, for which a certificate was awarded. Mr. Godfrey likewise secured a certificate for a white Carnation named Mary, and staged a pink variety designated Reginald Godfrey. Both varieties are very fragrant. Mr. A. Ambrose, Bristol, also staged blooms of a white Carnation named Blagdon Surprise. The flowers were large, and of good Street, Messrs. Benham & Froud, Ltd., Chandos showed the simplex syringe fumigator, which appears to be a useful contrivance. Dr. Walker had some of his patent tubes and cups. Mr. C. E. Shea, Foot's Cray, staged splendid blooms of Chrysanthemums Miss Dorothea Shea and Mdlle. There'se Rey, and secured a certificate for the last named variety, which is one of the best acquisitions of the year.

NATIONAL CHRYSANTHEMUM SOCIETY.

NOVEMBER 7TH, 8TH, AND 9TH.

MANY persons who were present at the great autumn exhibition held under the auspices of the National Chrysanthemum Society, at the Royal Aquarium, Westminster, on the above dates, expressed the opinion that it was one of the finest ever seen there. This doubtless was the case, for taken on the whole the blooms were excellent, and the same may be said of the trained plants. In most classes the entries were very numerous, and the competition exceedingly keen. It is to be regretted, however, that space there does not permit the exhibits to be better arranged, inasmuch as a little irregularity on this point causes confusion amongst exhibitors who are desirous of finding any special class.

OPEN CLASSES.

The principal class in the cut bloom section was for forty-eight flowers, to consist of twenty-four incurved and twenty-four Japanese, distinct, the prizes being the challenge trophy and £10 as first, £6 as second, and £4 as third. This class is open to Chrysanthemum and horticultural societies on conditions as stipulated in the National Chrysanthemum Society's schedule. There were three entries, and the first prize fell to the St. Neot's Amateur and Cottage Horticultural Society. The member who contributed the blooms was Mr. R. Petfield, gardener to A. G. Thornhill, Esq., Widdington, Huntingdon. The Japanese were not particularly large, but wonderfully bright and fresh, and comprised the following varieties:—Mrs. C. Harman Payne, Violet Rose, Lord Brooke, W. H. Lincoln, Gloire de Rocher, Mrs. Hubbuck, W. Trickner, J. Dyer, Pelican, E. Molyneux, Waban, Chas. Davis, Eda Prass (grand), Alberic Lunden (very fine), Mdlle. Marie Hoste, G. C. Schwahe, Sunflower, W. W. Coles, Viviand Morel (fine), Mrs. Briscoe Ironside, Primrose League, Mr. E. C. Clarke, Avalanche, and Mr. C. W. Wheeler. The incurved blooms were neat and clean, but some of them were rather flat. The varieties were Mons. R. Bahuant, Empress of India, C. W. Whitnal, Princess of Wales, Lord Wolesley, J. Lambert, Violet Tomlin, Mrs. Robinson King (fine), Ami Hoste (good), Queen of England, Alfred Lyne, Novelty, Baron Hirsch, Jeanne d'Arc, Alfred Salter, John Doughty, Madamc Darrier (excellent), Golden Empress, Robert Petfield, Mrs. Heale, Prince Alfred, Lord Alcester, Brookleigh Gem, and Miss M. A. Haggas. After due consideration the second prize went to the Havant Chrysanthemum Society, the flowers in this case being contributed by Mr. J. Agate. They were well grown, particularly the Japanese, of which Mdlle. Marie Hoste, W. W. Coles, Viviand Morel, Lord Brooke, Princess May, and Chas. Davis may be mentioned as being capacially good. as being especially good. The incurved blooms were rather small and flat but neat, the best heing Lord Wolseley, Baron Hirsch, and Madame Darrier. The Sittingbourne and Milton Gardeners' and Amateurs'

Association came third with creditable blooms, the incurved in this stand being the best.

Incurved Blooms.—In the class for thirty-six incurved blooms, distinct, there were six competitors, and the fight for the Holmes Memorial challenge cup of £10 as first prize was very keen. The Judges were a considerable time in adjudicating, but eventually it was decided that Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park, New Barnet, was first with a few points only. The blooms shown were grand, and comprised the following varieties:—Lord Alcester, R. Cannell, Mr. N. Davis, Prince Alfred, Mrs. Coleman, Cherub, Princess of Wales (grand), John Salter, Lord Eversley, Alfred Salter, Miss M. A. Haggas, Chas. Gibson, Lord Wolseley, Princess of Teck (fine), Mrs. Heale Mrs. Bobinson King, Ami Hoste, Princess Rostrice, Mons. Mrs. Heale, Mrs. Robinson King, Ami Hoste, Princess Beatrice, Mons. R. Bahuant, Jeanne d'Arc, Nil Desperandum, Queen of England, Lady Dorothy, Empress Eugénie, Violet Tomlin, Golden Empress of India, Mrs. Haliburton, John Lambert, Hero of Stoke Newington, Refulgens, Alfred Lyne, John Doughty, White Venus, Empress of India, Barbara, and Madame Darricr. Messrs. W. & G. Drover, Fareham, were awarded the second prize for a stand of fine blooms. The best of these were Empress of India, John Doughty, Lord Alcester, and Alfred Salter. Messrs. W. Ray & Co., Mount Pleasant Nursery, Teynham, secured the third prize; and Mr. H. Shoosmith, gardener to M Hodgson, Esq., Shirley, Croydon, the fourth, both staging fine blooms.

There were five exhibitors in the class for twenty-four incurved blooms, and here again the competition was keen. Mr. W. H. Lees repeated his former success, showing a stand of splendid blooms, which justifies him to a foremost position in the Chrysanthemum world. The varieties staged were Lord Alcester, Lady Dorothy, Princess Teck, John Doughty, John Salter, Madame Darrier (grand), Prince Alfred, Princess of Wales, Nil Desperandum, Mrs. Coleman, Hero of Stoke Newington, Miss M. A. Haggas, Lord Wolseley, Queen of England, Princess Beatrice, John Lambert, Alfred Lyne, Empress Eugénie, Violet Tomlin, Empress of India, Barbara, Golden Empress, Robert Cannell, and Jeanne d'Arc. Mr. C. W. Knowles, gardener to Chas. Egerton, Esq., Roehampton, was second; Messrs. W. Ray & Sons third; and Mr. J. Myers, gardener to the Earl of Sandwich, Hinchingbrooke Gardens, Huntingdon, fourth.

The class for twelve incurved blooms brought forth a very keen competition, there being no less than ten exhibitors. Mr. W. Collins, gardener to J. W. Carlile, Esq., Ponsbourne Park, Hertford, secured the leading award with a stand of neat blooms, deep in build. The varieties were Empress of India, Golden Empress, Princess of Wales, Mrs. Robinson King, John Doughty, Mrs. S. Coleman, Alfred Salter, Mrs. Heale, Violet Tomlin, Queen of England, Madame Darrier, and Lord Alcester, Mr. A. Felgate, Burchill, Walton-on-Thames, was second; Mr. B. Calvert Bishop Stortford, third; and Mr. G. Garpenter, Broad Oak, Byfleet. fourth. There were two competitors with six blooms of incurved varieties put into commerce in 1891 or 1892, but both were disqualified for staging flowers not in accordance with the schedule. With six incurved blooms of any one variety, there were seven competitors, and Mr. W. Collins was placed first with six grand specimens of Mrs. Heale. Mr. J. Hewett, Hillside House, Hythe, was second with Lord Alcester, and Mr. Calvert third with Violet Tomlin.

Japanese Blooms.—An exhibitor, who has been improving rapidly with florists' flowers during the past few years—W. Herbert Fowler, Esq., Claremont, Taunton—secured the first prize and the Holmes' Memorial challenge cup in the class for forty-eight Japanese, and his victory was the more creditable owing to the strength of the competition. His stand was not striking for weight, but it was wonderfully even, the flowers all being good and fresh. The varieties in the back row were J. S. Dibben, Etoile de Lyon, E. Molyneux, Stanstead White, Mrs. E. W. Clarke, Thos. Hewitt, Van den Heede, Thos. Selwood, Viviand Morel, W. K. Woodcock, Mrs. E. D. Adams, R. C. Kingston, Col. Smith, Julius Roehrs, W. H. Lincoln, and Duke of York. Middle row: Violet Rose, Sunflower, W. H. Lincoln, and Duke of York. Middle row: Violet Rose, Sunflower, Potter Palmer, Miss Dorothea Shea, a blush seedling, G. C. Schwabe, Florence Davis, W. W. Coles, Madamc J. Laing, Mrs. F. Jameson, G. W. Wheeler, Marie Hoste, W. Tricker, Miss Muriel Scott, Puritan, and Chas. Davis. Front row: Miss Anna Hartshorn, Beauté Toulousaine, E. G. Hill, W. Falconer, C. Shrimpton, Mrs. Alpheus Hardy, Rufacto Marshaletta, Mdlle. Thérèse Rey, Robt. Owen, Louis Boehmer, Beauty of Exmouth, Vice-President Calvat, Autumn Tints, Gloire du Rocher, J. Shrimpton, and Chas. Blick. Mr. Fowler had very sensible labels for his varieties. Mr. Chas. Cox, gardener to J. Trotter, Esq., Brickenden, Hertford, also had a very fine stand, some of his blooms, notably Hertford, also had a very fine stand, some of his blooms, notably E. Molyncux, Viviand Morcl, Boule d'Or, Chas. Davis, Wm. Seward, and Stanstead White, being grand examples. The old champion, Mr. C. Gibson, gardener to J. Wormald, Esq., Morden Park, was third. He had lighter flowers than the others, but they were otherwise admirable. Messrs. W. & G. Drover, Fareham, were fourth.

The stands in class 8 for twenty-four Japanese blooms made a show in themselves, for there were many fine exhibits. The best was that from Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, who had a very heavy and beautiful box, in which Colonel Smith (magnificent), Beauty of Castle Hill, Stanstead White, Violet Rose, W. Seward, J. S. Dibben, Puritan, and E. Molyneux were splendid It was one of the best twenty-fours ever shown. Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park, New Barnet, also had an excellent stand, and was placed second, his Viviand Morel. Charles Davis, Mrs. Alpheus Hardy, Sunflower, Colonel Smith, and Mrs. Jameson being very finc. Mr. H. Shoesmith, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, was third, his Colonel Smith, Viviand Morel, E. Molyneux, and Madamc Calvat being excellent flowers. Mr. W. Collins, gardener to W. Carlile, Esq., Hertford, was fourth. There were seventeen entries.

Mr. W. Allan, gardener to Lord Suffield, Gunton Park, proved that he can grow Chrysanthemums as well as Strawberries by staging a splendid stand of twelve blooms. It was composed of a magnificent Viviand More, very fine Coronet, Stanstead White, W. H. Lincoln, and Miss A. Hartshorn, and excellent Mrs. Payne, Avalanche, Stanstead Surprise, Comte de Germiny, J. Dyer, Sunflower, and W. Tricker—altogether a very fine display. Mr. Felgate, gardener to the Duchess of Wellington, Burhill, Walton-on-Thames, had a very fresh stand, Col. Smith, Viviand Morel, W. H. Lincoln, and W. Tricker being exceptionally good. Mr. Thorne, gardener to Major Joicey, Sunningdale, was third, and Mr. Sturt, gardener to N. L. Cohen, Esq., fourth, both showing well. In the class for six white Japanese Mr. W. Collins was first with fine Avalanche; Mr. Calvert, gardener to Col. Archer Houlton, second with the same variety; and Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., third with Florence Davis. With six of any other salest Mr. W. Colling was partial beginning to the form of F. Malancara. colour Mr. W. Collins won again, having a grand box of E. Molyneux; Mr. Shoesmith was second with Colonel Smith, and Mr. Telgate third with the same variety. Mr. W. H. Lees was first with Japanese incurved, staging Col. Smith, E. Molyneux, W. Tricker, W. H. Lincoln, Mdlle Carrière and Mrs. Alphone Hordy in boardiful and Mrs. Mdlle. Carrière, and Mrs. Alpheus Hardy in beautiful order. Mr. Calvert was a very good second, and Mr. W. H. Fowler third. Much interest attached to the class for twelve Japanese of 1891 and 1892. Mr. W. J. Godfrey, Exmouth, won with Miss Dorothea Shea, Lizzie Cartledge, Primrose League, Mrs. Harman Payne (very fine), Chas. Blick, Aureole Virginale, Van den Heede, Princess May, Duchess of Devonshire, J. Farwell, Pearl Beauty, and Lilian Russell. Mr. H. Shoesmith was second, and Mr. Fowler third.

Reflexed, Anemone, and Pompons.-With twelve large reflexed blooms, there were twelve competitors, and Mr.J. F. Thorne, gardener to Major Joicey, Sunningdale Park, was awarded the first prize. This exhibitor had Cloth of Gold, Pink Christine, Cullingfordi, King of the Crimsons, Distinction, James Carter, Cloth of Gold, Phidias, White Christine, Golden Christine, and Putney George. Mr. A. Sturt, Round Oak, Englefield Green, was second, and Mr. Chas. Brown, gardener to R. Henty, Esq., Langley House. Abbots Langley, third.

Mr. A. Ivies, gardener to C. E. Jukes, Esq., Hadley Lodge, High Barnet, was placed first in the class for twenty-four large-flowered Anemones, showing fine blooms. The best of these were Empress, Annie Lowe, Madame Lawton, Delaware, Nelson, George Hawkins, Sabine and Minnie Chate. Mr. W. Skeggs, gardener to A. Moseley, Esq., West Lodge, Barnet, was second, and Mr. John Milner, Willenhall Park, Barnet, third. Mr. Ivies had the best twelve Japanese Anemones; Mr. R. C. Notcutt being second, and Mr. J. Milner third. Mr. Ivies also secured the first prize for twelve large Anemone blooms (Japanese excluded), showing amongst others Lady Margaret, Annie Lowe, Empress, and Mrs. Judge Benedict in grand condition. Mr. A. Sturt was second, and Mr. C. Brown third.

For twelve Anemone Pompons, three blooms of each variety, Mr. J. Myers secured the leading award for a stand of fine blooms. N. Aldridge, Palmers Green, was second, and Mr. C. Browne third. Pompons were best shown by Mr. C. Brown, who had an excellent stand of blooms, amongst which Brilliant, Cinderella, and Black Douglas were very good. Mr. Turk was second, and Mr. J. Myers third.

Special Prizes .- In the class for twelve incurved blooms for the special prizes offered by Mr. E. C. Jukes, Mr. Robert Petfield, Diddington, Hunts, was first with neat blooms, amongst which Baron Beust, Eve, Mabel Ward, Mrs. Shipman, Lady Dorothy, Mrs. Rundle, and Venus were conspicuous. Mr. W. H. Lees was second, and Mr. C. W. Knowles third. Mr. E. Rowbottom, gardener to R. Williams, Esq., The Priory, Hornsey, secured the first award for six blooms of seedling Chrysanthemums, the prizes being offered by Mr. H. J. Jones. The varieties staged were A. G. Hubbuck, Autumn Tints, W. H. Atkinson, Mr. Chas. Blick, H. F. Tiarks, and Miss Muriel Scott. Mr. Herbert Fowler, Taunton, was second, and Mr. J. Agate third. Mr. W. G. Godfrey, The Nurseries, Exmouth, secured the silver medal given by Mr. Jones for six seedlings sent out last year, and this with Beauty of Exmouth, Miss Dorothea Shea, Mrs. H. Payne, Van der Heede, Golden Wedding, and Pearle Beauty.

Mr. Agate secured the first prize given by Mr. R. Owen, Maidenhead, for twelve blooms of six new incurved varietics, and Mr. C. Ritchings, Reigate, gained Mr. Godfrey's special prize for six blooms of Beauty of Exmouth.

AMATEURS' CLASSES.

The amateurs came out in strong force with twenty-four Japanese. J. R. Wildman, Esq., 9, Grove Road, Clapham Park, had an excellent stand; albeit the blooms, with the exception of Viviand Morel, Mrs. Jameson, and one or two others, ran rather small. Mr. J. Horril, West Street, Havant, was second with bright smooth flowers, and Mr. A. J. Parker, 172, New Kent Road, was third.

For twelve incurved blooms in this section, Mr. J. Horril, West Street, Havant, was placed first, showing good blooms of Lord Wolseley, Golden Emperor, Mrs. Heale and Prince Alfred; amongst others J. R. Wildman, Esq., was second, and Mr. Thomas Lansley, Watford, third. Mr. Alfred Holmes, The Grange, Gosport, was first for six incurved blooms, Mr. T. Brown, South Wimbledon, being second, and Mr. C. E. Wilkins, Woodside, Surrey, third.

With twelve, Mr. Alfred Holmes, Fort George, Gosport, won, and he had an excellent stand. Mr. Thos. Lansley, 155, Pinner Road, Watford, was a very close second, his blooms being good in every way. Mr. Tullett, gardener to G. Alexander, Esq., was third, under protest. There was very close competition in the sixes. Mr. F. Durrant, 4, New Road, Ware, was first, having a splendid Viviand Morel in his stand. Mr. J. Brown was second, Mr. Alfred Holmes third, and Mr. F. W. Buckingham, Tonbridge, was awarded an extra prize.

Mr. W. C. Pagram, gardener to A. F. Hobhouse, Esq., The Whim, Weybridge, won with twelve single Chrysanthemums, and he had a charming stand, Yellow Jane, Bessie Conway, Mary Anderson, Jane, Millie Agate, and Rev. W. E. Remfrey being very fine indeed. Mr. J. Agate, Havant Nurseries, was second, some points in the rear, his Golden Star being, perhaps, the best. Mr. Carpenter, gardener to Major Collis Browne, Broad Oak, Byfleet, was a good third. Mr. John Little, Romford, had the best stand of twelve in the amateurs' and single-handed gardeners' classes, and a very good one it was; Mr. E. Tickner, gardener to J. Watney, Esq., Reigate, being second, and Mr. W. C. Pagram third. Mr. Tickner won with six, Messrs. E. Mawley, Rosebank, Berkhampsted, and W. Jones, gardener to W. Hooper, Esq., Sutton, being second and third. Mr. Little, Romford, secured the first prize for twelve in Little blooms in this section, showing neat examples. Mr. J. G. Turk, High-gate, was second, and Mr. E. Trickner, Reigate, third. Mr. Pagram, Weybridge, staged the best six incurved blooms, Messrs. W. H. Davis and C. E. Wilkins following.

The metropolitan classes were open to growers who reside within the limits of the London County Council, and the whole of them were well filled. For twelve incurved blooms, Mr. F. Bingham, Stoke Newington, was first; Mr. W. Davey, Stamford Hill, being second, and Mr. F. W. Wraight third. Mr. J. Bury, Tewkesbury Lodge, Forest Hill, had the best six incurved blooms in this section; Messrs. J. Brookes, Highgate, and F. Bingham following. Mr. Brookes was first in the class for twelve Japanese, distinct; Mr. W. Beech, Hereford House, South Kensington, second, and Mr. Bingham, third. The last named exhibitor had the best six Japanese blooms. Messrs, Vince and Bury, being second and third. six Japanese blooms, Messrs. Vince and Bury being second and third.

GROUPS AND TRAINED PLANTS.

Only two groups of Chrysanthemums were entered for competition, these being arranged by Mr. H. J. Jones and Mr. Davis, to whom the first and second prizes were awarded. Mr. W. Davey, gardener to C. C. Paine, Esq., won with six standard trained large-flowered varieties; Mr. W. Donald, gardener to J. G. Barclay, Esq., was second; and Mr. W. Wesker third. Mr. G. W. Hendon won with standards of any varieties, Mr. Silks being second, and Mr. Hughes third. Mr. Donald had some of the finest trained specimens ever exhibited at these Shows. His six were magnificent examples, both as to health, training, and flowers. Margot and Gloriosum were superb. Mr. J. Hughes was second, and Mr. Wesker third. Mr. Hendon won with four, these being about half the size of Mr. Donald's plants. Messrs. W. Davey and Gilks were second and third. Mr. J. Hughes was first for six trained specimens of Pompons, and Mr. F. Gilks, Forest Road, Walthamstow, had the best "naturally trained" plant. Mr. D. Donald, Leyton, secured the leading award for a single specimen, showing Margot in grand condition.

MISCELLANEOUS.

Miscellaneous exhibits were numerous. Mr. Robert Owen, Maidenhead, staged a splendid collection of Chrysanthemum blooms. comprising all the latest novelties. Mr. W. Godfrey, Exmouth, also had some grand flowers of the newest varieties, which attracted notice. Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, made a special feature in the Exhibition by staging fine blooms in large vases, and these created quite a sensation. It would be well if this method of staging were more generally adopted. Messrs. E. D. Shuttleworth & Co., Limited, had a neat stand of table and greenhouse plants, healthy and wellgrown. Messrs. J. Laing & Sons had a table of large and richly coloured Apples. Mesers. B. S. Williams & Son contributed a stand of Orchids and Heaths, which was very much admired. Messrs. Cannell and Sons were represented by a splendid display of Chrysanthemums and Zonal Pelargoniums interspersed with Ferns, which created a most brilliant effect. Messrs. Sutton & Sons filled a long table with heaps of their fine Potatoes, Supreme, Windsor Castle, Triumph, Abundance, and Satisfaction, the tubers being of splendid quality. Mr. J. George, Putney, had horticultural sundries; Mr. J. Myers, Hinchingbrooke, the "Acme" self-clipping double rising tube for Chrysanthemums; G. W.

Davis, tins of fertiliser; and Williams, Iles & Co., pottery.
Mr. J. R. Chard, Stoke Newington, and Mr. F. W. Seale, Sevenoaks, divided the prizes for three vases or epergnes of Chrysanthemums, while Messrs. Perkins & Sons, Coventry, and Gilbert Davidson, Annanford, South Wales, won the awards for a table of bouquets and wreaths.

The special prizes offered by Messrs. Sutton & Sons for a collection of vegetables brought forth a good competition. Mr. W. Pope, High Clere Castle Gardens, was first for a grand collection. Mr. C. J. Waite was second, Mr. Richards, Sydmonton Court, Newbury, third, and Mr. G. Best, Basingstoke, fourth. Mr. Turton, Maiden Erleigh, Reading, was first for six dishes of culinary Apples, and also for a similar number of dessert Apples. Muscat and black Grapes were well shown by Mr. C. Giffen, Kingston-on-Thames, and Mr. Brown, Forest Hill, also had two good bunches of Gros Colman Grape, for which the first prize was awarded. Mr. W. Allan, Gunton Park, was first with six dishes of dessert Pears, Mr. W. Benwick being second. The last named exhibitor also staged a large number of Apples, and Messrs. W. Cutbush & Sons had Apples and bunches of Chasselas Napoleon Grapes. Amongst other things Potatoes were extensively shown in the competitive classes, and in addition to Messrs. Sutton's exhibits, C. Fidler staged Potatoes in fine condition, as did Messrs. H. Cannell & Sons, Swanley.

Numerous new Chrysanthemums were exhibited by some of the leading growers, including Messrs. H. Cannell & Sons, H. J. Jones, R. Owen, W. J. Godfrey, T. S. Ware and others, but no certificates had been awarded when our reporter left the building. These will be mentioned in our next issue.

KINGSTON AND SURBITON .- NOVEMBER 7TH AND 8TH.

THE seventeenth annual Exhibition of this far-famed Society must be recorded as among the very best that have been held this season, and Kingston again maintains the prestige it has won so well. Not a bad exhibit was to be found in the whole Exhibition, composed of over seventy classes. Marked excellence characterised the Show throughout, and Mr. G. Woodgate, the Hon. Secretary, Mr. John Drewett, the Hon. Treasurer, who has been connected with it from the first, and the executive may justly be proud of the success achieved.

More than usual interest centered in the Exhibition owing to there being two silver challenge cups awarded, one competition being for final possession. This was the sixth champion challenge vase, value 25 guineas, for forty-eight Chrysanthemum blooms, distinct, twenty-four incurved and twenty-four Japanese, arranged on separate boards. This having been won successively by T. H. Bryant, Esq., Juniper Hill, Dorking; Major Collis Browne, Broad Oaks, Byfleet; and Alfred Tate, Esq., of Downside, Leatherhead, the final competition this year was confined to those three gentlemen, as represented by their gardeners, Messrs. Beckett, Mease, and Carpenter respectively. Mr. W. Mease, who won the coveted honour last year, wrested it from the previous holders, and the vase now becomes Mr. Tate's property. The whole collection was massive, the blooms being of great depth, especially his twenty-four incurved. The collection consisted of the following varieties:—Japanese: Viviand Morel, George Daniels, Boule d'Or, Mrs. Harman Payne, Eda Prass, Edwin Molyneux, Condor, Col. W. B. Smith, Robert Owen (magnificent), Excelsior, W. Tricker (fine), G. C. Schwabe, J. S. Dibbin, Etoile de Lyon, W. Seward, V. P. Darquier, Mdlle. Thérèse Rey, Mrs. Falconer Jameson, W. H. Lincoln, Mrs. Cannell, Vice-President Calvat, Lord Brooke, Miss Anna Hartshorn, Chas. Davis. Incurved: John Lambert, John Doughty, Jeanne d'Arc (fine), C. B. Withnal, Robert Cannell, Mons. R. Bahuant, Marquise de Paris, Queen of England, Lord Alcester, Violet Tomlin, Golden Empress, Princess of Wales, Madame Darrier, Empress Eugénie, Mrs. S. Coleman, Empress of India, Princess Beatrice, Mrs. W. Shipman, Mrs. Heale, Nil Desperandum, Miss M. A. Haggas, Princess Teck, John Salter, and Novelty.

Mr. C. Beckett, gardener to T. H. Bryant, Esq., Juniper Hill, Dorking, was placed second. Most of his Japanese were of good build and possessed both finish and colour, but several of his incurves were lacking in depth. Sunflower, G. W. Childs, Beauty of Castle Hill, Excelsior, and Vice-President Darquier were amongst his best Japs; Jeanne d'Arc, Baron Hirsch, Princess of Wales, and Madame Darrier were the finest in finish of his incurves. Mr. G. Carpenter, gardener to Major Collis Browne, Broad Oaks, Byfleet, was a very close third, and he would probably have been in a stronger position had the Show been a few days earlier.

The seventh champion challenge vase, value twenty-five guineas, is open to subscribers of one guinea, for forty-eight Chrysanthemum blooms, distinct, twenty-four incurved and twenty-four Japanese, the winner to hold the vase till the next Exhibition. Should the same exhibitor win the vase twice (not necessarily consecutively) it shall become his property; but should it be won by three different exhibitors in the first three years, then the competition in the fourth year shall be confined to the three winners. Winners of the challenge vases:—1882, T. D. Galpin, Esq., Bristol House, Putney; gardener, G. Harding. 1883, W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hants; gardener, E. Molyneux. 1885, W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hants; gardener, E. Molyneux. 1887, J. Wormald, Esq., Morden Park; gardener, C. Gibson. 1888-9, W. Furze, Esq., Roselands, Teddington; gardener, E. Coombs. 1893, Alfred Tate, Esq., Downside, Leatherhead.

There were five collections staged for the new vase, the premier award being made to Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, who is now the holder for the first year of what in Chrysanthemum phrase is considered the blue ribbon of the show if not of the nation. This collection comprised of Japanese, Viviand Morel, W. H. Lincoln, Thomas Hewitt, E. Linsdale, Puritan, Beauté de Toulousaine, W. Tricker, Colonel W. B. Smith, Florence Davis, Stanstead Surprise, W. R. Woodcock, Marquise de Paris, R. Brocklebank, Condor, Lord Brooke, Stanstead White, Boule d'Or, Miss A. Hartshorn, Golden Dragon, Madame J. Laing, Comte de Germiny, Glorie du Rocher, J. Shrimpton, and Sunflower. Incurved: Lord Wolseley, Mrs. Colcman, Lord Alcester, Prince of Wales (fine), Mons. Bahuant, Golden Empress, Baron Hirsch, Jeanne d'Arc, Miss Haggas, Queen of England, John Doughty, Violet Tomlin, Empress of India, Prince Alfred, Mrs. Heale, Ami Hoste, Golden Queen of England, Mr. Brunlees, Alfred Lyne, and Mr. Bunn. Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, was a very good second. Robert Owen, a beautiful incurved Japanese, stood out most prominent in this collection; he had also good finished flowers of Jeanne d'Arc, Princess of Wales, and Nil Desperandum. Mr. J. Quarterman, gardener to C. E. Smith, Esq., Silvermore, Cobham, was placed third for an even and neat collection, and Mr. G. Woodgate, Warren House Gardens, Kingston, fourth.

In the class for twenty-four incurved, distinct, seven collections were staged. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park,

Leatherhead, was well ahead with a magnificent collection throughout; probably he staged as fine blooms of the Queen family as has been exhibited this season. Golden Empress was grand, also John Doughty, John Lambert, Queen of England, John Salter, Lord Alcester, Empress of India, Alfred Salter, Jeanne d'Arc, Lord Wolseley, Miss Haggas, Violet Tomlin, Princess of Wales, Prince Alfred, Baron Hirsch, Lady Dorothy, Nil Desperandun, Alfred Lyne, Madame Darrier, Mrs. Heale, Ami Hoste, Empress Eugénie, and Mabel Ward. Second honours fell to Mr. W. Jinks, gardener to W. Grant, Esq., Fair Lawn, Cobham; and the third and fourth to Mr. W. Mease and Mr. W. Neville in the order of their names.

For twelve blooms, incurved, distinct, Mr. W. Hopkins, gardener to Mrs. Wodderspoon, The Chestnuts, Walton, was placed first with Mrs. Heale, Violet Tomlin, Miss Haggas, Prince Alfred, Mrs. Coleman, Empress of India, Princess of Wales, Jeanne d'Arc, Queen of England, Madame Darrier, Golden Empress, and Ami Hostc. Messrs. C. Beckett and Mr. A. Felgate were placed second and third respectively. In the class for six incurved blooms six collections were staged, first honours falling to Mr. J. Thorne, gardener to A. E. Flood, Esq., The Bush, Walton; second to Mr. G. Mileham, gardener to A. T. Miller, Esq., Emlyn House, Leatherhead; and third to Mr. G. Holden, gardener to Mrs. C. W. Izod, The Lammas, Esher. For six of one kind Mr. Hopkins was first with Violet Tomlin; Mr. Neville second with Princess of Wales; and Mr. E. Coombs third with Baron Hirsch out of nine collections set up, and all meritorious.

There were six competitors for twenty-four Japanese, distinct, and the first prize was awarded to Mr. W. Higgs for solid blooms of Eda Prass, Mrs. Nisbet, Boule d'Or, Condor, W. Seward, Etoile de Lyon, Sunflower, G. C. Schwabe, Col. Smith, Vice-President Audiguier, Edwin Molyneux, Sarah Owen, Mrs. Falconer Jameson, Mdlle. Marie Hostc, Alberic Lunden, Puritan, Stanstead White, J. S. Dibben, W. Tricker, Miss Anna Hartshorn, Violet Rose, Beauty of Exmouth, and Viviand Morel. Second honours fell to Mr. W. Mease, and third to Mr. G. Trinder, gardener to Sir H. Mildmay, Bt., Dogmersfield, Winchfield.

In the corresponding class for twelve Japs, distinct, there were eight competitors, and Mr. G. Hunt was first with Viviand Morel, Miss Anna Hartshorn (fine), W. Tricker, Edwin Molyneux, Mons. A. Carrière, Mrs. F. Jameson, Boule d'Or, Mdlle. Marie Hoste, Robert Owen, Eda Prass, Florence Davis, and Vice-President Darquet. Mr. G. Holden was a very good second; and Messrs. Hopkins and Ridge third and fourth in the order of their names.

For six Japanese, distinct, Mr. F. King, gardener to A. F. Perkins, Esq., Oakdene, Holmwood, Surrey, was well to the front; Mr. H. Head, gardener to W. Daniels, Esq., Inglewood, Kew, was placed second; and Mr. C. Slade, gardener to General Gardiner, third. Mr. R. Ridge, gardener to Swifton Eady, Esq., Weybridge, secured the first prize for six of a sort with Viviand Morel; Mr. A. Felgate the second award with grand blooms of Sunflower; and Mr. G. Hunt third with Marie Hoste. The competition was splendid in these classes.

Messrs. Meases, Felgate, and Pitcher shared the honours for twelve reflexed. Anemones made a fine display, and Messrs. Jinks, Woodgate, and Turner secured the prizes in order of their names. Singles, Pompons, and Anemone Pompons were all well represented, collections of three blooms each in six bunches of the Rundle family had a beautiful effect. Messrs. Wells, Redhill; Plowman, Long Ditton; and Dorsett were placed first, second, and third respectively. The blooms were shown on leafy stems.

The best incurved bloom in the Show was Mrs. Coleman in Mr. Flight's stand, and the best Japanese, Edwin Molyneux, was shown by Mr. Hunt.

Groups are always good at Kingston, and this year they were better than ever. Mr. Mileham was deservedly awarded first honours for a collection that not only excelled in dwarfness of tabit, quality of flower, and above all in arrangement. Mr. T. Read, gardener to R. S. Bond, Esq., was a very good second; Mr. G. Springthorpe, gardener to W. A. Bevan, Esq., Coombe Court, Kingston, third; and Mr. W. H. Pitcher, gardener to Mrs. Dunnage, Albanes House, Surbiton, fourth. Mr. G. J. Cook, gardener to J. S. Sassoon, Esq., Ashby Park, Walton, deservedly secured first prize for a miscellaneous collection of flowering and foliage plants. Mr. Swan, gardener to Murry Smith, Esq., Brockley Lodge, Weybridge, secured the first prize with six beautiful trained plants of Mrs. Forsyth, George Glenny, Golden Christine, Mrs. Rundle, Peter the Great, and Pink Christine. Mr. F. King was placed second. Mr. Swan also secured first honours for trained Pompons, staging good examples of Golden Mdlle. Marthe, Mdlle. Marthe, Mr. Astie, and Marie Stuart; Mr. Atkins was second, and Mr. W. Cusbon third.

Fruit was well represented. Mr. Waite secured the first prize for a collection of four dishes, and Mr. Griffin, gardener to Alex. Christy, Esq., Coombc Bank, secured the special prize given by Mr. W. Lane for three bunches of black Grapes with Alicante. Mr. Griffin was also first in a white variety with Muscat of Alexandria. Primulas were seldom shown in such excellent condition, more especially those exhibited by Mr. Mease, which not only secured first honours but the silver medal for high culture. Several bouquets were exhibited, but some too formal, and the prizes seemed to be awarded to the more free and pleasing arrangements. Epergnes were tastefully furnished, Mrs. Nuttall, a daughter of Mr. Flight, who used to win honours at Winchester, being the most successful exhibitor. Mr. Waite had a grand collection of vegetables, in fact many exhibits were worthy of notice if time and space permitted, at this the last and best show that has ever been seen in the ancient town of Kingston-on-Thames.

BRIGHTON.-NOVEMBER 7TH AND STH.

THE annual Chrysanthemum Show of the Brighton and Sussex ' Horticultural Society was held in the Pavilion on the above dates, when a magnificent display was brought together. The Japanese blooms were of exceptional merit, the incurved ranging rather smaller than is customary, but making up in quality for what they lacked in Fruit, including Apples, Pears and Grapes, were staged in good numbers and splendid condition, as also were vegetables in various kinds. The arrangements of the Show under the superintendence of kinds. The arrangements of the Show under the superintendence of Mr. M. Longhurst, Secretary, and a committee of management were perfectly carried out, and reflected much credit on these gentlemen. Groups and specimen plants were seen in exceptionally good form and in great numbers. The exhibition was such an extensive one and so highly meritorious that we are unable to give a full list of the prizewinners, and append the names of those in the principal classes only.

Mr. H. Head, The Drive Nursery, Hove, was awarded the first prize for a group, arranged in a space of 14 feet by 8 feet, in which some grand examples were staged. Mr. J. Hill, gardener to M. Wallis, Esq., J.P., Springfield, Withdeane, was a good second; and Mr. F. Meachen, gardener to Mrs. Armstrong, Woodslee, Withdeane, third. For a semi-circular group in a space of 11 feet 6 inches by 6 feet, Mr. Fairs, gardener to R. Clowes, Esq., Clayton, Wickham, Hassocks, was placed first for an admirable arrangement. Mr. Sims, gardener to C. J. Inwood, Esq., The Retreat, Dyke Road, Brighton, was second; and Mr. Lister, gardener to E. A. Wallis, Esq., Lewes Road, Brighton, third. Mr. C. Ritchings, gardener to Dr. Frankland was an excellent first, securing Ritchings, gardener to Dr. Frankland was an excellent first, securing a silver medal for thirty-six Japanese, in not less than twenty-four varieties, staging—back row: Colonel W. B. Smith, E. Molyneux, Viviand Morel, W. H. Lincoln, Puritan, E. Molyneux, Puritan, Mrs. C. Harman Payne, J. Shrimpton, Mdlle. Marie Hoste, Viviand Morel, Col. W. B. Smith. Middle row: Charles Shrimpton, Professor Whitmack, Mdlle. Marie Hoste, President Borel, Gloire du Rocher, Condor, J. Shrimpton, W. H. Lincoln, E. D. Adams, President Borel, Beauty of Exmouth, Mrs. A. G. Ramsey. Front row: Florence Davis, Sunflower, William Saward W. H. Atkinson, Florence Davis, Excelsion William William Seward, W. H. Atkinson, Florence Davis, Excelsior, William Tricker, Lord Brooke, Prince du Bois, William Seward, and Etoile de Mr. Slaughter was a good second; Mr. Hart was third; and Lyon. Mr. Penford fourth.

In the class for twenty-four Japanese, distinct, there were five stands staged, Mr. Slaughter, Jarvis Villa, Steyning, being first. His stand was comprised of-Back row: Vice-President Audiguier, Gloire du Rocher, Mdlle. Marie Hoste, Mrs. C. Harman Payne, Mrs. É. D. Adams, E. Molyneux, W. H. Lincoln, and a pale sport from Viviand Morel. Middle row: Alberic Lunden, Puritan, Val d'Andorre, Condor, Mrs. C. H. Wheeler, Florence Davis, Etoile de Lyon, John Dyer. Front row: Sunflower, Madame Baco, Sarah Owen, Excelsior, Avalanche, Lord Brooke, Amos Perry, Madame J. Laing. The blooms in this stand were splendid, being uniformly of good shape and colour. Mr. G. Goldsmith, gardener to Sir E. G. Loder, Leonardslee, Horsham, was second; Mr. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, third, and Mr. Wallis, gardener to Mrs. Mews, Hartwell, Hartfield, fourth. For twenty-four incurved, in not less than eighteen varieties, Mr. Ritchings, gardener to Dr. Frankland, Reigate, was first with compact blooms of fine form. They consisted of—Back row: Baron Hirsch, Lord Alcester, Violet Tomlin, Golden Empress, Empress of India, N. Davis, Golden Empress, Baron Hirsch. Middle row: Jeanne Manner, Prince Alford Princes & Welley William Princes & Welley Wel d'Arc, Prince Alfred, Princess of Wales, Miss M. A. Haggas, Violet Tomlin, Lord Wolseley, Jeanne d'Arc. Front row: Lady Hardinge, Nil Desperandum, Mrs. G. Rundle, Mrs. Dixon, Cherub, G. Glenny, Mrs. G. Rundle, and Jardin des Plantes. Mr. Goldsmith was second with larger blooms, which, however, were not so well finished, and Mr. Penford, gardener to Sir F. Fitzwygram, Leigh Park, Havant, third. Equal fourth prizes were accorded to Messrs. Heasman and Standing. There were ten competitors in the class for twelve incurved, distinct, Mr. Fowler, gardener to Mrs. Hall, Barrow Hill, Henfield, being first. The flowers were of fair size and substance. The blooms in the back row were Camille Flammarion, John Lambert, Ami Hoste, Prince Alfred. Middle row: Miss Haggas, Lord Wolseley, Mrs. Heale, Madame Darrier. Front row: Alfred Lyne, Jeanne d'Arc, Violet Tomlin, and Novelty. Mr. Horscroft, gardener to T. Potter, Esq., Ardingly, was a fair second; Mr. Tourle, gardener to F. Barchard, Esq., Uckfield, and Mr. Baker, gardener to F. H. Brady, Esq., Burgess Hill, fourth.

Mr. Horscroft was a good first for twelve Japanese, distinct, staging —back row: Viviand Morel, Edwin Molyneux, Florence Davis, Colonel W. B. Smith. Middle row: Avalanche, Gloire du Rocher, Madame J. Laing, Puritan. Front row: W. H. Lincoln, Louise Leroy, C. Becket, and Miss Anna Hartshorn. The second prize went to Mr. Fowler; the third to Mr. Emery, gardener to M. G. Megaw, Esq, Avoca, Eastbourne; and the fourth to Mr. Sayers, gardener to Mrs. Cook, The Hall, Nutley, Uckfield. Mr. Emery was first for six Japanese, distinct, with Mrs. C. Harman Payne, Edwin Molyneux, Florence Davis, Viviand Morel, W. H. Lincoln, and E. A. Carrière. Mr. Baker was second, Messrs. W. Miles & Co., West Brighton Nurseries, being third. Mr. Heasman was first for six Anemones, staging Jean Marty, Margouluie, Empress, Mons. Chas. Lebocqz, Mrs. Judge Benedict, and Grand Alveole. Mr. Penford was second, Mr. Tourle third, and Mr. H. Harris fourth. Mr. Heasman was first for six reflexed, showing Cloth of Gold, King of Crimsons, Dr. Sharp, Golden Christine, Mrs. Forsyth, and Pink Christine. Mr. Ritchings was a good second, Mr. Penford third, and Mr. Hart, Shoreham, fourth. Mr. Dancan was first for six incurved, one variety, with Jeanne d'Arc; Mr. Jupp second with Princess of Wales; Mr.

Fowler third with Madame Darrier; and Mr. Baker fourth with Jeanne d'Arc.

Mr. Duncan was first for six Japanese, one variety, with handsome examples of E. Molyneux; Mr. Horscroft second with Viviand Morel; Mr. H. Head, The Drive Nursery, Hove, third, with the same variety; and Mr. Slaughter, fourth, also with Viviand Morel. Mr. Duncan was first for six Japanese, white, staging Ava'anche in good form; Mr. Slaughter being second, Mr. Tourle third; and Mr. Heasman fourth. Mr. Baker was first for six yellow Japanese with fine Sunflowers; Mr. Duncan second with the same kind; Mr. Slaughter third with W. H. Lincoln, and Mr. Baker fourth. Mrs. S. Coleman, West End, Henfield, was first for twelve Pompons with charming flowers; Mr. Harris second; Mr. Blake, gardener to F. C. G. Roper, Esq, Polegate, third; and Mr. G. Hart fourth. Specimen plants were shown in grand condition, Messrs. G. Hart, E. Meachen, A. Scutt, and Jas. Hill being amongst the most successful exhibitors in these classes.

Miscellaneous exhibits were numerous, and included a collection of fruit from Messrs. J. Cheal & Son, Lowfield Nursery, Crawley; bulbs from Messrs. Tilley Bros., Brighton; Orchids and Palms from Mr. H. Garnett, gardener to R. G. Fletcher, Esq., Patcham; Chrysanthemums from Mr. W. Wells, Rcd Hill; and fruit, bulbs and Orchids from Messrs.

W. Balchin & Son, Hassocks Nursery, Sussex.

SOUTHAMPTON.—NOVEMBER 7TH AND 8TH.

AFTER a lapse of several years, through want of support financially, the Royal Southampton Horticultural Society ventured upon holding an autumn Exhibition this year on the dates named, in the Victoria Hall. From a horticultural point of view it was a success. The exhibits, if not numerous, possessed quality. The arrangements were, as they always are here, quite perfect, under the guidance of Mr.

S. Fuidge, the Secretary.
Cut blooms formed the principal part of the Exhibition. leading class was that for twenty-four, twelve Japanese and tweive incurved, the first prize going to Mr. G. Inglefield, gardener to Sir J. W. Kelk, Bart. His best blooms were—Japanese: Col. W. B. Smith, E. Molyneux, Mdlle. M. Hoste, Etoile de Lyon, W. H. Lincoln, W. H. Tricker, Avalanche, Mrs. F. Jameson, Le Verseau (good), Alberic Lunden, and Sunflower. Incurved: Golden Empress, Empress of Lunden, and Sundower. Incurved: Golden Empress, Empress of India, Emily Dale, Prince Alfred, Miss Haggas, Lord Alcester, Lord Wolseley, Princess of Wales, Jeanne d'Arc, Empress Eugénie, Queen of England, and Mrs. N. Davis. The second prize went to Mr. G. Hughes, gardener to W. Baring, Eq., Norman Court, Salisbury, with equally good incurved, but falling away in Japanese. Mr. Penford, gardener to Sir F. Fitzwygram, Bart., M.P., Leigh Park, Havant, was third.

The next important class was for twenty-four blooms, not more than two of one variety. Mr. Inglefield again led the way, closely followed by Mr. Hughes and Mr. Penford in the order named. Mr. Inglefield was also first for twelve Japanese and twelve incurved, the second prizes in both cases going to Mr. Hughes. For twelve blooms, not more than two of any one variety, Mr. Hughes was first. Mr. Budd, gardener to F. G. Dalgety, Esq., Lockerby Hall, Romsey, was second; and Mr.

Penford third.

Plants were well shown. For the best collection, arranged in a space Plants were well shown. For the best collection, arranged in a space 60 feet square, Mr. G. Busby, gardener to Colonel F. Willan, Thorn Hill, Bitterne, was an easy first, his plants being dwarf and carrying good blooms. Second, Mr. F. Rossman, florist, Shirley. For four Japanese, Mr. E. Rose, gardener to Dr. Allden, The Firs, Bassett, was first with fine specimens of Lady Selborne and Mdlle. Lacroix, closely followed by Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak, Bishopstoke. For a single specimen Japanese, Mr. E. Carr was easily first with Madame Bertic Rendatler, 5 feet through; and Mr. Rose second. For a group of miscellaneous plants arranged for effect. Mr. W. second. For a group of miscellaneous plants arranged for effect, Mr. W. Peel was first with a very light arrangement, closely followed by Mr. E. Wills, nurseryman, Shirley.

Fruit was good throughout. In the class for three distinct varieties Mr. W. Saunders, Junction Road, Andover, was first; and Mr. W. Mitchell, gardener to J. W. Flemming. Esq., Chilworth Manor, second. For two bunches of black Grapes Mr. T. Hall, gardener to S. Montagu, Esq., M.P., South Stoneham, was first with fine Alicante. Mr. Mitchell was second. Apples and Pears were well shown by Mr. G. Bushby, Mr. T. Hall, Mr. S. H. Goodwin, Meredith, Maidstone; and Mr. J. Miles,

gardener to W. Perkins, Esq., Portswood. Vegetables were best staged by Mr. Inglefield and Mr. Bushby.

Messrs. George Bunyard & Co., Maidstone, Kent, sent 100 dishes of Apples, which were greatly admired. Collections of plants not for competition also came from Mr. Wills; Major Montagu Day, Terrace House; Messrs. Toogood & Sons, Southampton; W. H. Rogers, Red Lodge Nursery, Southampton; and Mr. B. Ladhams, which helped to make the Show attractive.

WATFORD.—November 7th and 8th.

As anticipated, the Watford Chrysanthemum Show has proved a great success, there being really a gay Exhibition in the Clarendon Hall on the above dates. The number of entries were about the same as last year, but the blooms in colour and excellence generally certainly in advance of any previous season.

The President of the Society, the Earl of Clarendon, gives it most substantial support, not only by the interest he takes therein, but by the magnificent group that year after year he contributes for decoration. On this occasion Mr. Myers, his head gardener, exceeded his previous efforts by placing in the centre of the hall the finest group ever seen here. The Chrysanthemums were very fine, and the foliage plants choice. Many plants of Clerodendron fallax brightened the front of the

The competing groups were well worthy of admiration, and of the first in the miscellaneous class was one tastefully arranged and finished. The credit of the arrangement goes to Mr. Neve, gardener to C. Van Raalte, Esq., Aldenham Abbey, whose skill was conspicuously shown this year in other parts of the Exhibition. The second prize, which fell to Lord Esher (gardener, Mr. Brown), was also worthy of mention.

The classes in Division I were open to any growers, but the competitors were practically all local, and we fancy their merits could not well be exceeded. The competition between the groups which took the first and second prizes was very close, but to Mr. C. E. Keyser, Warren House, Stanmore, was awarded the premier honour, and he also took the silver cup (value 5 guineas) for the best group of Chrysanthemums in the Show, and the silver medal for the best exhibit. The second prize fell to the energetic Hon. Secretary, Mr. C. R. Humbert (gardener, Mr. Ashdown). The flowers and foliage of both exhibits were exceptionally good, and the colours well harmonised in arrangement. The groups in the other divisions sent by H. H. Gibbs, Esq., W. Gillilan, Esq., R. T. Prowse, Esq., Mrs. Robins, G. J. Beer, Esq., and W. B. Hawkins, Esq., also attracted considerable attention.

The cut blooms were of great excellence, and the judges were more

than surprised at the number of good blooms shown. Mr. C. Van Raalte was again prominent, and in the open classes was first for twentyfour incurved varieties, twenty-four Japanese varieties, and six incurved blooms, in addition to which he took the prize for the best incurved bloom in the Show, the specimen being Madame Darrier. Similar honours were taken by Mr. Beekett, gardener to H. H. Gibbs, Esq. Mr. C. E. Keyser secured the prize for the best Japanese bloom with a grand specimen of Viviand Morel. The exhibits by Mr. T. F. Blackwell displayed some good standard blooms, and there was very strong competition in the class for white Japanese blooms of one variety. In the open class for twelve Japanese some superb flowers were shown by Mr. Fortnum. These are a few of the principal exhibits among the many that were staged. In the other divisions there were also some very fine flowers, prizes being taken by Mr. K. D'Arcy, the Earl of Essex, A. G. Lucas, Esq., R. Henty, Esq., and numerous other gentlemen. Mr. Fox had some excellent blooms in the classes open to amateurs who do not employ a gardener. It was gratifying also to see the cottagers' classes so well filled.

The table decorations and bouquets were a distinct and beautiful feature of the Show, and the whole of the exhibits were good. From the body of the hall visitors proceeded to the gallery, where, it is said was set out the most magnificent show of vegetables ever seen anywhere. The exhibits were so excellent throughout that it would be extremely

difficult to go into detail. The exhibition of fruit was also splendid; in fact, taking the Show all through, we question whether the Society has ever been so successful

as in their present venture.

LEEDS PAXTON .- NOVEMBER 7TH AND 8TH.

THE fifth annual Show of the Leeds Paxton Chrysanthemum Society was held in the City Hall on November 7th and 8th. The numerous classes were not only well filled but the competition in most cases was The cut blooms were the leading feature of the Show.

For the eighteen incurved, not less than fourteen varieties, the first prize £5 and a 7-guineas challenge cup, were won by G. B. Cockburn, Esq., Lingdale Lodge, Claughton, Birkenhead. His flowers, reading from left to right, were Lord Alcester, Mons. R. Bahuant, Queen of England, Lord Alcester, Miss Violet Tomlin, Queen of England, Miss Violet Tomlin, Jeanne d'Arc, Golden Empress of India, Ami Hoste, Jeanne d'Arc, John Lambert, Miss M. Haggas, Madame Darrier, John Salter, Jardin des Plantes, Mr. Coleman, and Princess of Wales. The second prize fell to Mr. Jacobs, Cragge Road, Rawdon.

The class for eighteen Japanese, for similar prize money and cup of above value, fell to the same exhibitor, Mr. Cockburn. The blooms in the winning stand were Etoile de Lyon, Mrs. F. Jameson, Princess May, Mrs. E. W. Clark, Mrs. F. Jameson, Stanstead White, Mons. E. Bunard, Stanstead White, E. Molyneux, Florence Davis, W. Tricker, Gloire de Rocher, Viviand Morel, W. Tricker, Colonel W. B. Smith, Boule d'Or, Avalanche, Viviand Morel. The blooms of Japanese, both in this and other classes, were excellent, far above the average shown in other years, in size, depth, and quality. The second prize went to Rev. W. B. Thatcher of Cleat Hall, Stourbridge. This class drew no less than twelve exhibitors. In the class for twelve incurved, the Earl of Harrington (gardener, Mr. J. H. Goodacre) carried off the first prize. For the same number of Japanese C. J. Ormerod, Esq., of Brighouse (gardener, Mr. A. Barber), was first. In the remaining open class the winners were Sir Jas. Kitson (gardener, Mr. Grix), Mr. Bowling (gardener, Mr. Moore), and Mrs. Tetley (gardener, Mr. Eastwood).

The local class, confined to a radius of seven miles from the City

Hall, for a cup value £10 10s. and a prize of £5, brought four entries. A. Jacobs, Esq., gained first honours, by this means securing the cup, he having won it twice in succession. Sir James Kitson (gardener, Mr. Grix) was a very close second, Mr. Jacobs gaining the winning point with his Japs. Mr. Grix's incurved were both larger and better flowers.

The groups of Chrysanthemums were not up to the usual standard, only one group, shown by Mrs. Tetley (gardener, Mr. Eastwood), was at all worthy of note, he very easily securing the first prize, Judges withholding the second prize. The specimen plants of Chrysanthemums

were very well shown, Mrs. Tetley and C. F. Firth, Esq., of Adel (gardener, Mr. J. Linfoot), taking the principal prizes in the different classes. Groups arranged for effect were poor, only two exhibitors staging. E. B. Faber, Esq., Harrogate (gardener, Mr. Townsend), secured first prize; Mr. Sunley of Monk Fryston getting second. In the local class for a group Mr. P. Bowering easily secured first prize.

Table plants were very well shown, Sir J. Kitson securing prizes in two classes. Fruit and vegetables were also staged in excellent con-

Messrs. Charlesworth, Shuttleworth & Co., of Bradford, staged a magnificent display of Orchids; Mr. W. Crossley had a fine collection of Palms for decorative purposes; and Mr. Taylor also showed a stand Messrs. G. Bunyard, of Maidstone, sent a fine collection of 150 varieties of Apples and Pears; and Mr. Green staged a fine collection of Yorkshire-grown fruit, about sixty varieties.

NORTHAMPTON.—NOVEMBER 8TH AND 9TH.

THE twenty-second annual Show of the Northamptonshire Chrysanthemum Society was held in the Corn Exchange of the town on the above dates. The Exhibition was excellent in every way, the entries being large in many of the principal classes, and the competition remarkably keen. The cut blooms, more especially in the Japanese section, were of a high order of merit, the specimen plants and groups also being very noteworthy. Fruit, Vegetables, Primulas, and table plants were extensively and admirably shown, table decorations being also very fine. Space will not permit of a detailed report being given, the prizewinners in the principal classes only are therefore mentioned.

Mr. Reeve, The Gardens, Cliftonville, was first in the class for a group of Chrysanthemums arranged in a space not exceeding 8 fect by 7 feet 6 inches. The plants were dwarf, well flowered, and the arrangement excellent. For six Japanese, distinct varieties, not dwarf trained, Mr. Gwillam, gardener to Mrs. Shepard, was a good first, showing Margot, Source d'Or, Miss Gordon, Mdlle. Lacroix, Val d'Andorre, and W. H. Lincoln. Mr. Manning, Kingsley Park, was second; and Mr. Reeve third. Mr. Gwillam was first for four Japanese in distinct varieties, Mr. Reeve being second. For one Japanese Mr. Gwillam was again first with a fine plant of W. H. Lincoln, and Mr. Reeve second with Wm. Tricker. Mr. Gwillam was also first for six specimen plants of large flowering varieties with finely flowered plants of Mrs. Dixon, White Venus, John Salter, Mr. G. Glenny, Guernsey Nugget, and Mrs. Rundle. Mr. Manning was a good second. For four Pompons, distinct, Mr. Gwillam again took the premier position, showing Elsie Dordan, Nellie Rainford, Fremy, and Sœur Mélanie. Mr. Copson, gardener to Mrs. Phipps, Collingtree, was second; and Mr. Manning third. For one specimen Pompon Mr. Gwillam was first with White Code Nulli: Mr. Copson second with the same variety: and Mr. Cedo Nulli; Mr. Copson second with the same variety; and Mr. Manning third with Mdlle. Maither.

Manning third with Mdlle. Maither.

For a group arranged in a space of 6 feet by 6 feet, open to amateur growers only, Mr. Hemmings, 43, Hood Street, Northampton, was first with a splendid arrangement; Mr. Kirby, 29, Milton Street, Kingsley, being second; and Mr. C. Richardson, 10, Artizan Street, Northampton, third. Mr. J. Barkaway, 71, Long Thruft Street, Northampton, was first in the amateurs' class for three Japanese, not dwarf trained. The plants, which included Val d'Andorre, L'Adorable, and Mdlle. Lacroix, were well grown and flowered. Mr. C. Seaton, Great Houghton, was second; and Mr. H. Law, 38, Hood Street, Northampton, third. The chief prizewinners in the remainder of the amateurs' classes for plants in pots were Messrs. W. Kirby, E. Bellham, H. Law, J. Barkaway, C. Seaton, H. G. Dunkley, and W. F. Henman.

Mr. Copson was first for eighteen incurved distinct, showing clean, shapely blooms of—back row: Lord Alcester, Lord Wolseley, Empress of India, Mons. R. Bahuant, Queen of England, Alfred Salter. Middle row: John Doughty, Princess of Wales, Ami Hoste, Jeanne d'Arc, Camille Flammarion, John Lambert. Front row: Hero of Stoke Newington, Madame Darrier, Empress Eugénie, Mr. Brunlees, Princess Teck, and Lady Dorothy. Mr. Cole, gardener to Earl Spencer, was second, and Mr. Pearce, gardener to S. Loder, Esq., third. For twelve incurved, distinct, Mr. Copson was a splendid first with—back row: Lord Alcester, Mons. R. Bahuant, Empress of India, Lord Wolseley. Middle row: Alfred Salter, Jeanne d'Are, John Doughty, Queen of England. Front row: Mr. Brunlees, Prince Alfred, Lady Dorothy, and Hero of Stoke Newington. Mr. Cole was second, and Mr. Tipler, gardener to M. M. Smith, Esq., Aylesbury, third. Mr. Copson was first for six incurved, showing Lord Alcester, John Doughty, Alfred Salter, Queen of England, Lord Wolseley, and Empress of India in excellent form. Mr. Coles was second, and Mr. J. Kightley, gardener to Sir H. Wake, third. Mr. Kightley was first for six incurved, one variety, with beautiful examples of Jeanne d'Arc, and Mr. Copson second with Lord Alcester.

Mr. W. Pearce was first for eighteen distinct Japanese. There were six stands, the first being composed of handsome clean blooms of-back row: Mrs. E. W. Clarke, W. H. Lincoln, Viviand Morel, Stanstead White, Edwin Molyneux, Etoile de Lyon. Middle row: Avalanche, Comtc de Germiny, Mdllc. Marie Hoste, Mrs. F. Jameson, Florence Davis, Boule d'Or. Front row: Mons. Bernard, Puritan, Mrs. C. W. Wheeler, Bouquet des Dames, J. Stanborough Dibben, and Wm. Tricker. Mr. J. Copson was a good second, and Mr. J. Cole third. There were six competitors in the class for twelve Japanese, distinct, the competition being remarkably keen, Mr. W. Pearce being eventually placed first. The stand consisted of—back row: W. H. Lincoln, Viviand Morel, Florence Davis, Beauty of Castle Hill. Middle row: Louis Boehmer, Mdlle. Marie Hoste, Gloire du Rocher, Wm. Tricker. Front row: Mr.

A. H. Neve, W. K. Woodcock, J. Stanborough Dibben, and Bouquet des Dames. Mr. J. Copson was a good second, and Mr. Cole third. Mr. Cole was first for six Japanese, ctaging grand flowers of Etoile de Lyon, E. Molyneux, Colonel W. B. Smith, Mrs. E. W. Clarke, Sunflower, and Viviand Morel. Mr. J. Copson was a close second, and Mr. Alexander, gardener to Messrs. Westley & Sons, Blisworth, third. For six Japanese, one variety, Mr. J. Kightley was first with grand blooms of Sunflower, Mr. Tipler being second with the same variety, and Mr. Alexander third with Viviand Morel.

In the amateurs' class for eighteen incurved in not less than twelve varieties Mr. W. Issitt, 84, Princers Street, Kettering, was a good first, Mr. Hemmings second, and Mr. Dunkley third. For twelve incurved, distinct, Mr. Hemmings was a good first, Mr. Issitt second, and Mr. Dunkley third. Mr. Issitt was first for twelve Japanese with very handsome blooms, Mr. Kirby being second, and Mr. Dunkley third. For six Japanese Mr. Issitt was first, Mr. Dunkley second, and Mr. Kirby third.

Miscellaneous exhibits were not numcrous, that of Messrs. T. Perkins and Sons, Drapery, Northampton, consisting of grandly coloured Apples and fine Pears, being by far the most prominent. The same firm also decorated the bandstand and platform with Chrysanthemums and other plants in an artistic and highly creditable manner. Mr. Cole, Althorp Gardens, showed six handsome blooms of Mrs. Alpheus Hardy; and Mr. Colchester, Ipswich, arranged a stand of his Ichthemic guano.

PUTNEY .- NOVEMBER STH AND 9TH.

The sixteenth Exhibition of the Putney and Wandsworth Chrysanthemum Society was held in the Cromwell Hall, Putney, on the dates named. Five excellent groups were placed in competition, the first prize (silver cup) arrangement of Mr. S. Mynett, gardener to Col. Poe, C.B., Ashburton, Putney Heath, being remarkable for the superior quality of the blooms as well as tasteful association—one of the test groups of the season up to date. Mr. John French, Ambleside, Wimbledon Park, was a very strong second; G. Allen, Esq., St. John's, Putney Hill, a most creditable third; and Mr. J. Williamson, gardener to Thos. Jay, Esq., Holmwood, Putney Hill, fourth; an extra prize being awarded to Mr. W. Tew, gardener to Mrs. E. Gordon, Westcombe Lodge, Wimbledon Common.

Altogether creditable groups of eighteen plants were staged by amateurs, the silver cup collection, exhibited by W. B. Rogers, Esq., 19, Carlton Road, Putney, being of great excellence, as were the second prize plants of Alfred Lass, Esq., Sandown Lodge, Upper Richmond Road, Putney; G. W. Lambert, Esq., 6, Northumberland Avenue, Putney, being a most creditable third.

The most successful exhibitors of specimen plants were Mr. J. Portbury, gardener to W. N. Froy, Esq., Ripon House, Putney Heath; and Mr. C. Bentley, gardener to Capt. W J. Bosworth, Cedar Court, Roehampton, whose specimens displayed 'derable cultural skill.

The incurved cut blooms were fresh and neat, the Japanese full and bright. Mr. J. Dark, gardener to Jas. Hooker, Esq., Lomond House, Putney, was first in the class for twenty-four incurved, and Mr. Portbury second. Mr. S. Mynett was first with twelve good blooms, and Mr. W. J. Wright, Th Frove, Wimbiedon Park, third. Mr. Portbury won the first position with twenty-four, and also twelve Japanese, Messrs. Wright and Mynett being second respectively in those classes. Mr. Wright was first with reflexed and second with Pompons, Mr. Bentley being first with the latter; all very good.

The prizes for miscellaneous groups of plants were won, first by Mr. J. Portbury with a charming arrangement, and second by Mr. Macgregor, gardener to the Dowager Lady Hay, North House, Putney

Heath.

Mr. J. F. McLeo', gardener to J. P. Morgan, Esq., Dover House, Roehampton, exhibited a large and highly meritorious group of plants not for competition, which added materially to the interest of a bright and beautiful show. Fruit and vegetables were well represented, and the Show was admirably managed by Mr. J. Moore, Hon. Secretary and G. H. Pitt, Esq., the much respected Treasurer of the Society.

Peaches and Nectarines.—Earliest Houses.—These may be of two descriptions, according to the varieties they are planted with, and the time the fruit is required to be ripe. 1, Very early house, planted with Alexander, Waterloo, Early Louise, and Early Leopold Peaches, and Advance (Early Rivers is a better variety), Nectarine to have fruit ripe in April. 2, Earliest house on the old system, or with second-early and midseason high flavoured varieties, as Hale's Early, Early Alfred, Dymond, Stirling Castle, and Royal George Peaches, with Lord Napier and Elruge (some prefer Stanwick Elruge, but it casts its fruit in ripening in light soils), Nectarines, to have ripe fruit in May. Alexander and Waterloo Peaches are very much alike; some growers prefer one and some the other, but both are high coloured fruits of good size and fair quality. Their flowers are medium-sized, and set well on spurs or on

the annual growths at their points and base, the intermediate buds between those parts being frequently cast. Early Louise and Early Leopold Peaches have small flowers, and laden with pollen are excellent for fertilizing other varieties. Early Leopold is, perhaps, the best setter of the early Peaches, and its fruits, also Early Louise's, are better flavoured than either Alexander or Waterloo, both of which are clingstones, but the other two are freestones. Colour, of course, is everything in a marketing early-forced Peach, but the distinction must be made between the fruits for safe guidance. All the others named are

of superior quality, high colour, and good size. To have fruit ripe at the times named the houses may be closed about the middle of this month, fire heat not being applied until the beginning of December. This will allow the trees plenty of time, and express forcing-having the fruit ripe in three months from starting-is not safe, and only possible with potted trees. The house may be kept close, but admitting air freely above 50°, employing fire heat only to prevent the temperature falling below 35°. Trees that have not been started before will grow gently and safely under this treatment, whilst those forced before will start freely at the usual time without any preliminary excitement. The more slowly the trees are excited the stronger will be The outside border should blossoms and chances of a good set of fruit. be protected with a few inches thickness of leaves, and a little litter over them to prevent their blowing about, so as to exclude frost. Inside borders should have a thorough soaking of water, but if the lights have been off and the soil has been well moistened through to the drainage water will not be required for several weeks. Where the roof lights have remained on it may be necessary to repeat the watering, and if the trees are weakly, the soil friable, and the drainage good a soaking of liquid manure not too strong will tend to a more vigorous start and growth afterwards. Sprinkle the trees occasionally in the morning and afternoon of bright days, but do not keep them dripping with water, damping the borders and floors being sufficient in dull weather, and

Succession Houses.—All the leaves are off, except in the latest house, where they should not be forcibly removed, though the trellis may be sharply rapped or the trees brushed over with a light broom when they part readily from the trees. When they are all off unfasten the trees from the trellis, prune them, thoroughly cleanse them and the house, lime-washing the walls, and if need be paint the woodwork and trellis. Tie the trees to the trellis, leaving room for the branches to swell, tight tying being conducive of gum. Remove the surface soil without much disturbance of the roots, and supply fresh loam, sprinkling over it 4 ozs. of the following mixture per square yard: Three parts steamed bonemeal and one part kainit, following with a good watering. The manurial elements will be held by the soil and be in a suitable form for taking up by the roots when the trees start into growth. The roof lights may be removed, and be kept off until the buds commence swelling and are showing colour in spring. This is the best practice with late houses, especially unheated, so as to retard the blossoms; otherwise keep the houses as cool as possible.

Fresh Trees, Lifting, and Root-pruning.—Trees for planting in houses are best two, three or four years trained to walls outdoors or trellises in cool houses, and prepared for lifting by digging round them a year previously. Such trees can be lifted with an abundance of fibres, and being carefully planted they force well the first season, not bringing them on too rapidly, and taking a moderate crop. This is better than selecting young trees unfurnished with bearing wood, as these cannot bear any fruit until the second year, and not much the first three years to do them justice, hence the advantage of planting trees in an already bearing state. Any lifting or root-pruning should be performed at once, as the trees will often push adventitious roots freely into the fresh or moved soil, and the roots cut form a callus and push new fibres quickly in spring. Lifting and root-pruning is unquestionably one of the best preventives of gumming, and bringing trees not setting and stoning their fruits properly into a satisfactory condition in those respects. Done carefully and early (as soon as the leaves have fallen or before) it does not interfere with the following season's crop of fruit.

Strawberries in Pots.—All plants intended for early forcing should now be in frames, with a view to protect them from heavy rains, snow and severe frosts only. They should be well raised up to the glass and have the pots plunged in ashes, from whence they can be drafted into the houses as required. It is a bad practice to stack the plants in sawdust or earth in a cone-like manner against walls or place them in Peach houses with open ventilators, where, from the passing currents of air, evaporation is constant and excessive, which only waste the energies of the plants and not unfrequently destroys the roots at the sides of the pots. Drought at the roots is the great bane of the Strawberry, therefore those in frames must never be neglected, the soil always being kept moist but not excessively wet. Plants for midseason and late forcing may be plunged in ashes in a sheltered situation, affording a light covering of bracken or straw in severe weather.

Plants of La Grosse Sucrée and Vicomtesse Héricart de Thury must be started early in next month to afford ripe fruit in March either in the Peach house statted then or in the Strawberry house. Some start the earliest plants in bottom heat, making up a bed of leaves about 2 feet in height and place the plants in a frame upon it, packing the spaces between the pots with damp leaves. The bottom heat at the base of the pots is not allowed to exceed 65°, the top heat being kept cool, 50° not being exceeded, and when the weather is mild drawing off

the lights. This tends to promote activity at the roots and to steadily push the crowns without their developing leaves. After three weeks of this treatment the pots are gradually withdrawn from the bed, raising them so that the plants will bear the temperature of the Peach or Strawberry house without a check, as they would receive one if they were taken from a warm bed direct to the shelves. This practice is good where the plants are late, but in the case of those with well developed crowns and abundant roots the slight bottom heat is not necessary. Nevertheless bottom heat is one of the best aids in early forcing.

Those having the convenience of low pits, with a pathway inside, for forcing Strawberries, find it a considerable advantage to start the earliest plants in bottom heat, raising the bed well up so that the plants are near the glass, and not allowing the heat at the base of the pots to exceed 65°, nor the top heat to rise above 50° without full ventilation, and only using fire heat to maintain it at 50° by day and 45° at night in severe weather. Under these conditions the plants push the trusses strongly, and by the time they are clear of the crowns, the bottom heat will have declined so that the plants can be removed to their fruiting quarters without giving them any check, or it must be effected by withdrawing the pots gradually. Time is gained and the setting is generally satisfactory under such conditions. Watering must be judiciously performed, and if worms have gained an entrance into the pots dislodge them with lime water, rectifying any defects of drainage.

THE KITCHEN GARDEN.

Tomatoes.—Strong young plants in 11-inch or slightly smaller pots give the best late autumn and winter crops, and pay well for close attention. If there is head room do not stop the leading growths, as by allowing these to extend it will be possible to set good clusters of fruit for ripening early next spring. Pinch out all side shoots that form, and if the plants are all heavily furnished with leaves, reduce the latter to about half of their present size with a view to giving the lower clusters of fruit a better chance to ripen. According as the soil becomes crowded with roots give rich top-dressings, liquid manure also being applied occasionally Under this liberal treatment each plant ought to give not less than 8 lbs. of fruit, this ripening at a time when Tomatoes are somewhat scarce. An occasional rich top-dressing is also needed by old plants that have set, or are setting fruit freely, and all superfluous growth should be closely removed from them. Now that the colder weather has set in Tomatoes must have plenty of fire heat, accompanied by a circulation of dry air, fungoid diseases being inevitable in a moist atmosphere. The fruit will set freely at this late date under such conditions if only the stems are smartly tapped by a padded stick every morning towards twelve o'clock. If the "white fly" is troublesome dress the hot water pipes with flowers of sulphur mixed with milk, and make them as hot as possible occasionally. The fumes thus generated will gradually, but surely, exterminate the fly, and prove a good preventive of disease.

Mushrooms.—High temperature, especially when brought about by fire heat, is very prejudicial to Mushrooms. Only enough should be turned on to keep the temperature of a house in which beds are required to produce Mushrooms constantly from falling much below 50°, an increase of 5° being the maximum with fire heat. When subjected to higher temperatures the produce is thin and not nearly so succulent as Mushrooms grown without the aid of fire heat, the beds also becoming more quickly exhausted. Only when fire heat is used is there any need to damp the walls and floors daily. An occasional sprinkling will not be harmful, but beware of saturating the beds by a too free use of the syringe. The loss of moisture to an injurious extent ought to be prevented by means of a thick covering of soft strawy litter, and when it is necessary to water owing to the beds being too dry to commence cropping, or wants moistening after a first crop has been taken, give enough warm water at once or at the most twice to well moisten both the soil and manure to a good depth, merely wetting the surface being of no avail. If there is room form other beds, these, if properly managed, yielding extra heavy crops next February or March, if not earlier.

Beds either in the open or in unheated sheds should be heavily covered with a strawy litter, and the drier this is the warmer the beds underneath will keep. When the litter next to the soil becomes damp and musty remove it, and substitute some that is fresh and dry. If any of the later formed beds fail to produce Mushrooms during November they may not do so till next spring, and none should be too hurriedly condemned and broken up.

Asparagus.—This choice vegetable is very easily forced, but unless a supply can be maintained throughout the winter at not very wide intervals, it is scarcely advisable to start forcing so early as this. It must also be remembered that roots once forced are of no further value, and well established beds ought not lightly to be broken up unless there are others to meet the demand for naturally grown shoots next spring. Hard forcing ought in any case to be practised, an excess of fire heat being certain to force out nothing but poor weakly shoots. If deep heated pits are available fill two lights at a time with a gentle hotbed largely composed of leaves, a layer of rich soil being placed on the top of these. Pack the carefully lifted roots somewhat closely on the soil and cover with about 4 inches of rich moist soil. Then if the top heat does not exceed 55° to 60°, strong succulent shoots of a good length will be forthcoming in from three weeks to a month of the time the start was made. Asparagus can also be forced without the aid of fire heat, frames set on hotbeds being used, that is if no brick pits are available. In the course of another three weeks start more roots in the same manner, and

never let the soil about any of them become dry, also do not subject the roots to a dangerously strong bottom heat.

Seakale.—The roots of Seakale have now experienced the desired check by being frosted somewhat, and without which they do not force so readily as desirable. Forming hotbeds over the crowns where they are established in the ground is a slow, laborious process, the better plan being to lift two or three dozen strong young roots at a time, or better still, enough for two or three batches at one time, and to sink these up to the crowns in large pots or deep boxes filled with rich moist soil. At this early date, if the pots are set in a heated Mushroom house, progress is slow, a dark corner not far from the hot-water pipes in a forcing house being a more suitable position. In order to be certain of well blanched succulent tops, complete darkness, as well as a sufficiency of heat and moisture, is necessary, and the crowns should therefore be heavily banked over with either leaf soil or cocoa-nut fibre refuse, a depth of 5 inches being none too much. Start more crowns every ten days or a fortnight. Lily White is the best variety for forcing, but is not so hardy as the old form. When severe frosts are anticipated, either lift the bulk of the roots that are to be eventually forced, laying them in closely in good soil where they can be covered with litter or mats, or else bank over the crowns with fine soil, this being drawn up to them much as Potatoes are moulded up.

Rhubarb.—The early Rhubarb has now had a fairly good rest, the severe frost of October 31st also being of service in preparing the clumps for forcing. Any variety can be forced, though Early Albert, Hawkes' Champagne, and Johnstone's St. Martin's are the best for the purpose, earliness, colour of stalk, and good flavour being characteristics of these excellent forms. Comparatively young roots could be lifted, placed in large pots, and forced very much the same as advised in the case of Seakale, while large old clumps could be shifted to either a forcing house, warm corner over boiler, Mushroom house, or warm cellar, only enough soil either left on or placed over the roots to keep them moist being needed. A gentle heat is preferable, and soil about the roots should not be allowed to become at all dry. Rhubarb may also be had by Christmas by forcing in the old-fashioned way, the clumps having the soil about them loosened prior to being covered by either regular Rhubarb pots, tins discarded by sugar refiners, old flour tubs, or deep boxes. There should be lids on the tops of these coverings to admit of ready access to the Rhubarb, and they ought to be heavily banked over with enough leaves and stable manure to generate a fairly brisk bottom heat, or say from 75° to 80°, a close look-out being kept for any sudden and dangerous rise that might take place after a change from cold to mild weather.

HE BEE-KEEPER.

APIARIAN NOTES.

HINTS FOR BEGINNERS. (Continued from page 387.)

What the bee-keeper has to consider in order to make the most of bees at his command is, how long will the honey flow continue? If for five or six weeks, make an increase of stock up till the beginning of that time, as then more hives with fertile and prolific queens are placed into the field, and swarms always work better, while by the renewal of queens and combs all risks of losing hives through effete queens are gone, and finer honey and healthier hives are secured. But on the other hand, if the honey flow at the best can last only two or three weeks the stock should be limited, and if desirable an increase postponed until the great honey flow is past. Arrange to have the greatest number of workers in the field at the proper time. Try to have them swarm a month at least before the flow begins, and if the hives then are not in strength to your mind join several together. Prevent stocks having young fertile queens from swarming by providing ample breeding space.

In my own case the Clover is not usually profuse, although I have taken from one hive 130 lbs. at a time, and nearly 7 cwt. from six, which were exhibited at Glasgow in 1876. The present year from several stocks (spring count) 200 lbs. have been taken from a The Wild Thyme and Heather are what I prepare my hives to catch, and they are so manipulated that every one of them is equal in strength to a full sized non-swarmed stock. In most cases these Heather stocks come up of their own accord to that strength, but if the spring and early summer have been backward I sometimes transfer brood combs to nuclei formed early in the season, as they are at all times most reliable. In late Heather seasons it is almost futile to keep stocks under full strength, as such will not be profitable, neither are hives with prolific queens, unless they are ahead of the fertility of the queen. This is the rock on which many bee-keepers wreck themselves, and keeping bees in too small hives while bees and queen are determined on breeding is a wrong

I do not want to sulphur my bees, but they must not be allowed to increase at a time when they can be more profitably employed.

The number of stocks for wintering should be regulated before the close of the Heather season, and by having the hives properly arranged when set down this is sometimes easily accomplished. Occasionally it is better to do this before we move them, at the end of the Clover season, when the Heather is likely to be of short duration. But at Leadhills the Heather lasts so long that many hives are more reliable than few, but in all cases they should be strong. At "midheather," if practicable, remove surplus honey and join stocks. In cases where there is not much honey nor brood remove all empty combs from both, transfer to one of them all combs having honey, and brood along with the bees. Preserve the empty combs for future use if white, but if blackened with age melt them and take what wax they yield. It ought to be a rule to have no combs older than twelve months in any hive, as the honey from white combs is superior, while supers above them are magnificent and more pure than those above blackened with age.

Sometimes the bees may miss the Heather till after it is half gone, but it is a fact that it yields more honey then than in its earlier stages, and one week's fine weather then with double strength hives will enable them to store 100 lbs. each. As I have stated, the bee-keeper must study the best and proper time to perform the various manipulations according to circumstances and the best of his judgment, but even then it may sometimes happen that the best has not always been done. Still, work at all times for the best and in hopes of favourable results.—A LANARKSHIRE BEE-KEEPER. (To be continued.)

THE SEASON OF 1893.

As regards East Yorkshire, the past season has been a good one; never have I had honey of such quality before. From early spring to the present time the weather has been favourable for the bees. They were at work soon after 7 A.M. on October 19th on our Michaelmas Daisies, and at four in the afternoon were busy still. Our take of honey has been a good one, and very few swarms have been the result. My hives were well tired up, and having plenty of room, not one of my bar-frame hives swarmed, and been strong in bees, gave a good surplus. Large hives are far the best. The standard hive, with a capacity for holding ten frames and a crate of twenty-one sections, is a mere toy and a source of trouble. Where the honey season is over by the end of July the non-swarming hives give the best results. Large hives, with plenty of bees and young queens, are necessary if a good surplus is to be taken.

The Lanarkshire hive has again done well with me, one of mine

The Lanarkshire hive has again done well with me, one of mine occupying six divisions; it was a pleasure to see the busy toilers pouring in and out in crowds. This hive was worked for extracted honey. From another I took some good sections, for which I secured a first prize for twelve at our local show.—G. R.

PRESENTATION OF HONEY TO THE LORD MAYOR.

An interesting ceremony took place in the Mansion House on November 1st, when a number of gentlemen, representing the British Bee-keepers' Association, offered the Lord Mayor of London a collection of British honey to the amount of 1 cwt. The presentation was made in the State drawing-room by Sir J. Whitehead, M.P., in the absence of the President of the Association, Baroness Burdett-Coutts.

Sir J. Whitehead said that the honey had come from all parts of the United Kingdom-England, Scotland, Ireland, and Wales. His connection with the Association arose from the fact that he, as Pastmaster of the Fruiterers' Company, had taken a very great interest in the cultivation of fruit in this country, and all experts in fruit culture seemed to think that bees were essential for the fertilisation of the flowers. The net profit to be derived from the cultivation of honey depended on the successful treatment of bees, and the object of the Association was to impart the knowledge of the cultivation of bees, and possibly to recreate the industry. He had in his own knowledge a case in his native county of Westmoreland, where a small tradesman had eighty hives. the spring and summer, when the flowers in the fields were in bloom, and up to the time the bees had swarmed and made their casts he kept them in the valleys, and afterwards took them on to the moors where they could gather honey from the Heather, and the result of the eighty hives, after paying all expenses, was a net profit of 55s. per hive, or £100. The county of Kent had in some respect been taken as a typical county of what might be done with regard to bee culture, and it was estimated that there alone no less than 400 tons of honey could be grown, provided that those who had hives were sufficiently skilled in the art of cultivation. That 400 tons, sold at 9d. a pound, would give to that county alone no less than £33,600.

TRADE CATALOGUES RECEIVED.

Dicksons & Co., 1, Waterloo Place, Edinburgh.—Forest Trees, Shrubs and Coniferæ.

W. L. Lewis & Co., Southgate, London, N.—Special Catalogue of Orchids.

Fotheringham & King, Dumfries, N.B.—Forest and Ornamental Trees, Roses, and Fruit Trees.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Blood Manure (J. H. W.).—Your letter arrived too late to enable us to deal with the question in this issue, but it shall be referred to next week.

Chrysanthemum Bloom (A. H. E.).—The distinctness or merits of a Chrysanthemum can only be determined from well developed blooms, and not from the small specimen you have forwarded. The other matter shall have attention in our next issue.

Scale on Kentia Leaf (W. D. M.).—The small brown scale can now be attacked effectively with an insecticide. Fir tree oil is very efficacious and harmless to plants, so also is Lemon oil, petroleum emulsion, Kilmright, Chelsea blight composition, carbolic and nicotine soaps, and other advertised insecticides, provided each is used at the strength advised in the instructions accompanying the several preparations. The insecticide should be applied with a brush, and the insects dislodged, and afterwards cleanse the plants with clear tepid water. Spirit of wine, diluted with about half its quantity of water, and applied with a small brush, so as to dislodge the pest, is a cleanly method of removing the scale. Methylated spirit may also be used very effectively, just moistening a brush with it and then wetting the scale insects with it. If the fronds are young the methylated spirit should be diluted similar to the spirit of wine; on mature fronds it either may be used neat, or only employing enough to wet the insects.

Fuchsias from Seed (Amateur).—Raising Fuchsias from seed is certainly, as you suggest, "interesting to amateurs," but it is very probable that only a few of the seedlings will on flowering prove equal to existing varieties. The pods should be carefully gathered when ripe. As the seeds are enveloped in a pulp it is necessary, in order to preserve them, to cleanse them effectually. This is done by washing; bruise the berries with the hand, and mix them with water; as soon as the pulp is all washed off pass the liquor through a hair-sieve fine enough to catch the seed, wash it repeatedly till it is quite clean, then dry it gradually; put it up in brown paper, and keep it in a dry room till spring. Sow then in a mixture of light sandy loam and peat, cover slightly, and place the pots in a gentle hotbed. When the seedlings are half an inch high transplant them in rows across pots 5 inches wide—these will hold about twenty or thirty plants each—and then replace them in the hotbed. In these pots they may remain for a month or six weeks, and then they will require placing singly into 3-inch pots. Place them for a few days in a cold frame, and keep rather close and shaded till fresh roots are formed, and then they are then able to bear the full light and a moderate admission of air. Give plenty of the latter as they acquire strength, and when the pots are full of roots give another shift into 4-inch pots, and let them remain in these till they flower. Many of them will flower the first year, and then is the time to make a selection. The selected ones should be repotted, and grown to the end of the season to prove them. Cuttings of the best may be inserted, and the whole kept in the coolest part of the greenhouse during the following winter.

Rooting Marguerite Cuttings (Reader).—The cuttings should be of the growing shoots, and about 3 inches in length, severing each transversely below a joint, and removing the leaves about half way up. The cuttings may be inserted singly in small pots (2½ inches in diameter), or five or six cuttings round the edge of a 4-inch pot. One crock is sufficient for drainage, with a little rough material over it, for the small pot; but an inch or more of material should be provided for the larger size. Fill the pots firmly with soil, composed of equal parts leaf mould and light loam passed through a half-inch sieve, adding a sixth of sharp sand, thoroughly mixed. Sprinkle about a quarter of an inch of sand on the top, and insert the cuttings with a blunt dibber, just deep enough to allow the base of each to rest on the sand carried down by the dibber, and about half the length of the cutting, or down to the leaves. Press the soil round the cuttings, particularly their base, and afford a gentle watering through a fine-rosed waterpot. Stand the pots on ashes or similar material in a house having a temperature of 40° to 50°, and cover with a bellglass or handlight, and keep close until rooted. The glass or handlight may be taken off each dull morning for about an hour for the dissipation of excessive moisture, and in the evening the

glass should be wiped dry. The cuttings will be rooted well in about a month, when they should be gradually hardened off. This plan is better than rooting the euttings in bottom heat, for the latter receive a eheck more or less when they are removed from it, unless care is taken to harden them off well beforehand. The large-flowered variety with green leaves is Chrysanthemum Halleri; the small one with glaueous leaves is C. frutescens.

Banksia integrifolia (B. M.).—This plant, to which you allude, has been figured in the Journal of Horticulture, but as you desire "to see it again," we reproduce the woodcut (fig. 63) with the description. Banksias are a peculiar genus of plants, the species forming which contribute largely to the native vegetation of New South Wales and other districts in the great Australian continent. These plants with their relatives the Proteas were at one time much grown in large establishments in England, but of late years they have been almost lost, and are now seldom seen except in botanie gardens. Some are perhaps more strange than beautiful, but there are several which are by no means devoid of attractions, and would add to the interest of many gardens. Of these the Australian Honeysuekle (Banksia integrifolia) is especially noteworthy as a free-growing and floriferous plant, which recommendations are not possessed by all its allies. The popular name appears somewhat far-fetched, as are many other popular names; but it does not refer to the habit of the plant as might be supposed, but to the quantity of

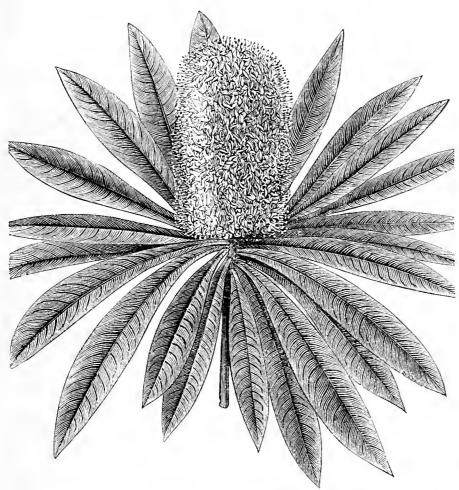

FIG. 63.—BANKSIA INTEGRIFOLIA. (Reduced.)

neetar secreted in the flowers. Banksia integrifolia is a shrubby plant, usually of moderate size in cultivation, but attaining much greater dimensions in its native land, where some of its near relatives rise to a height of 50 feet. The flowers are yellowish in a cylindrical head at the ends of the branches. The leaves are narrow and undivided, dark green, and firm in texture. The plant succeeds in light turfy loam and peat, and requires only the temperature of a greenhouse or conservatory, supplying water carefully when not in flower.

Rose Heps (N. H.) - These are not in any way injured by remaining on the trees to be frozen to some extent; indeed, it is questionable if severe frosts are detrimental to their germination. Gather them when ripe, open them, and store the seeds in damp eoeoanut fibre refuse or leaf mould till the spring. They may be sown either in pots or boxes in a frame on a mild hotbed, or in drills in the open ground in March. Artificial heat accelerates germination, but as the first essential of the Rose is hardiness some raisers sow in the open on the assumption that only seedlings that prove their undoubted hardiness are reliable for propagation. Some of the seeds are often slow in germinating, therefore there must be no undue haste in disturbing the beds, or withholding water from pots or boxes in which the seeds have been sown. Cover the seeds an ineh deep, and keep the soil uniformly moist by shading to arrest evaporation, and watering to supply moisture as it may be required.

Names of Fruits .- Notice .- We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is | F

to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all eases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number eannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (J. W. Allen).—1, Cox's Orange Pippin; 2, Tower of Glamis; 3, Spanish Bon Chrêtien; 4, Besi Vaet; 5, probably Lemon Pippin. (H. O. S.).—2, Golden Noble; 3, Lewis' Incomparable; 4, Margil. (J. M. K. C.)—1, Cox's Pomona; 2, Golden Spire; 3, Wadhurst Pippin; 4, Marie Louise; 5, Golden Winter Pearmain; 6, Urbaniste. (Colvile Browne).—1, Waltham Abbey Seedling; 2, Aromatic Russet. (F. J. Gray).—Pear not known. It has nothing to recommend it. You had better graft the tree. (E. R.)—1. Uvedale's to recommend it. You had better graft the tree. (E. R.).—1, Uvedale's St. Germain; 2, Beurré d'Amanlis; 3, Ne Plus Meuris; 4, Viear of Winkfield. (W. Strugnell).—Apparently a small wrinkled Seville Orange; large fruit, Diospyros Kaki, a native of Japan, sometimes imported into this country as a dried sweetment; small rosy seeds, probably the fruit of Magnolia acuminata, but in the absence of leaves and other characteristics it is impossible to identify with accuracy; black fruit, Juglans nigra or Black Walnut, not edible. (A. D.). Cox's Orange Pippin.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at onee, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp, (W. Strugnell).—Priekly Plant, Colletia spinosa. (M. B., Betteshanger).
—Florists' flowers, varieties of Dahlia glabrata. (L. B.).—Lælia anceps. (H. L. M.).—Cypripedium caudatum. (A. D.).—Jasminum Sambae flore-pleno. (H. W. C.).—Impatiens Hookeri.

PROFITABLE LIVE STOCK.

Many a grazier, struggling under stress of difficulties intensified and rendered almost insurmountable by the long hot dry summer, would be inclined to question if there is such a thing as profitable live stock at the present time. If so, it is certain that he has none of it. It is precisely because of the scarcity of stock in this country upon which any profit is possible that attention is called to the matter now. Inferior stock is plentiful enough, because of the general carelessness both in breeding and feeding, and we might add in selection. In most instances the fault dates from the very beginning of a tenancy, when the difficulty of obtaining really useful animals is considered so great that recourse is had to the Michaelmas auction sales, where so-called "bargains" are plentiful. Numbers of inferior animals are got together, costing just as much—often a great deal more—to keep, even in healthy condition, as really well-bred stock. Yet a little inquiry would enable any farmer to ascertain where better stock could be had. In this, as in other matters, demand brings supply, and it is surely worth while to purchase animals upon which, under good management, some profit is a certainty.

Taking cattle first, we know that while prices for ordinary beasts have fallen below any possibility of profit, ripe compact animals of moderate size have always had a prompt sale at remunerative prices. Said a recent market report, "The trade is overdone with meaty stores," or beasts about half ripe for the butcher. Not only is the metropolitan market g'utted with this class of stock (much of it imported), but it is always largely in evidence at every provincial market. It is true enough that there is money to be made out of "meaty stores," but it does not go into the pockets of the poor grazier. He sells them at a loss; it is the keen dealer who buys cheaply, fattens, and sells at a profit. The beasts come into his hands tolerably forward in condition, so that the fattening process is as speedy as it is certain. If only the grazier had a little more staying power he might do so much better than part with his stores just when they are ready to "pay" for high feeding. That the general practice in this matter is radically wrong is certain, yet there is no mystery about the right way; it is summed up in very few words. Have only well-bred cattle; either a pure breed or a good cross breed. Keep on the calf flesh, keep up condition always, but avoid the rash and extravagant forcing which involves the risk of heavy losses from Give equal attention to shelter and to a sound wholesome dietary. Let there be no exposure to heavy rain or cold cutting wind, no lying down on sodden litter, no inhaling foul air. Let the dietary be mixed wholesome, a wise combination of bulk with nutriment, preferably of home-grown produce—hay, silage, straw, corn, roots, green fodder, afford a sufficient range for a most nourishing dietary. Have no feeding by line and rule, know your cat'le individually, be much among them, understand the requirements and temperament of every one of them, and then wise discretion and sound judgment will guide weight and measure in the feeding. See that the water is pure, that crib and manger are clean. Allow no brutality; hindly, gentle treatment is all important apart from any mere sentimental feelings. When the autumnal growth of herbage on pastures is consumed, get the beasts settled for the winter in yards with broad commodious hovels. In doing this place the more forward larger animals together separate from the others; if large and small, weak and strong, are turned in together, the weaker literally go to the wall. We have seen them driven out of the hovels into the open yard, where they remain afraid to venture inside again. This often happens at nights with fatal results if rough weather prevails. The frightened animals will get what shelter is possible from the yard enclosures, but the standing there for hours, very likely in several inches of water, with rain or snow falling upon them, and gusts of wind sweeping round the yard, has led to colds, husk, consumption, and eventually the loss of many a valuable beast.

Worse than this is the battle for life going on every winter among cattle in open pastures, without shelter of any sort but the hedgerows, and with very short commons indeed. They have in the way of food to clear up the fog, which at best is a mixture of brown, dry, or decayed herbage and green growth, all sadly innutritious. A little hay is thrown about the pasture, forming a dietary barely sufficient to sustain vital heat. The famished beasts lose flesh so fast, and the strain upon them is so severe and prolonged, that it is wonderful to find so many of them surviving an ordeal which is alike cruel to them and ruinous to their owners.

WORK ON THE HOME FARM.

With Mangolds already up to 30s. a ton, a full root crop is something to be proud of this autumn. Let there be no more delay in getting them off the land into clamps, made by a road at points easy of access; a long ridge 10 or 12 feet wide at base, and 6 or 8 feet in height, answers best. Cover thickly with litter, over which place soil sufficiently thick to keep out frost, leaving air vents made with 2-inch drain pipes along the ridge. Treat early sown Swedes in a similar manner, or place them in small circular heaps in fields where sheep folding is to be done. Such folds on upland pasture are now in full action, and we have seen some good practice this month in folding a late growth on Clover layers, with the ploughs and drills following closely for Wheat.

Never was there better weather for winter corn sowing, and all other autumn sown crops. Glad were we recently to hear a keen discussion in a provincial market train, of the respective merits of Vetches, Rye, Coleseed, and Cabbage. Plenty of such and other green fodder crops to use with corn and relieve the pasture, are wanted everywhere. The dictum of Professor Wrightson that the great secret of successful farming is to make stock pay, and the corn will then take care of itself, is sound enough. Let work on the home farm at this season of the year tend that way, by judicious sheep folding, by careful tending of stock in cow, cattle yard, stable, and piggery. At farms generally the judicious production of milk, butter, cheese, pork, poultry, eggs, should all tend to profit now. Pullets selected from several broods in spring are giving a supply of eggs now that is invaluable. In this highly important manner it is just a question of timely selection, of number and also of breeds. We have had an excellent supply of winter eggs from white and coloured Dorkings, from cross-bred fowls and others, but never from those misnamed everlasting layers, the Hamburghs should not be forgotten that a warm poultry house must be had for winter layers, and they must be well fed. Let them also have a cosy dusting place, shut in from cold winds, but so placed as to catch every ray of winter sunshine. Warmth, shelter, and good food tell, and are indispensable.

REMARKS.

29th.—Brilliant morning; occasional cloud in afternoon; overcast evening.
30th.—Almost cloudless throughout.
31st.—Cloudless almost throughout but some detached cumulus at midday.
1st.—Overcast till 3.45 P.M.; slight rain at intervals after.
2nd.—Continuous rain from 3.30 A.M. to 9 A.M.; occasional drizzle in morning; overcast afternoon and night.

3rd.—Fine about sunrise; overcast and dull from 8 A.M. to noon; frequent bright sunshine after 1.30 P.M.

4th.—Bright early; overcast from 9 A.M., frequent drizzle from 10.30 A.M., and rain from 0.30 to 1.30 P.M.; and overcast after.

At last we have a slightly cool week, not a cold one, but one slightly below the average, of which there have been very few since January.—G. J. SYMONS

T is many years since we have seen such heavy crops of Apples as were grown this season, yet there is every likelihood of the supply falling off very rapidly. As yet not a single early or midseason variety that has come under my notice is keeping really well, and, to all appearance, good Apples will be even scarcer at midwinter than they often are after what may be termed a very bad year for Apples. Duchess of Oldenburg was one of the first to indicate what we were to expect. Finer, cleaner-looking fruit of this variety I never gathered, yet within a fortnight of their being ripe not one was fit to use. Black spots first showed on the surface, and shortly after the disease, if such it may be termed, spread to the core, the fruit eventually either bursting or turning black. Irish Peach and Beauty of Bath among early dessert varieties, and Lord Suffield, Keswick Codlin, and Ecklinville of culinary sorts, all behaved very similarly, not a sound fruit being left at a time when they ought to be on the point of ripening. Manks Codlin being somewhat firmer kept rather better, but was past its best early in October, or more than a month earlier than usual. Warner's King I have known keep well till the middle of December, but hereabouts it is doubtful if there were any sound fruit by October 7th. It was quite distressing to see the large, clean-looking fruit of this variety becoming first spotted and then black all over, but the tale of woe does not stop there. Tower of Glamis is over, while Hollandbury, Lemon Pippin and Reinette de Canada are giving signs of failing. Our sheet anchor, the Beauty of Kent, of which we have several large trees, gave us heavy crops as usual, but fully one-half of the fruits are spotted, and instead of being good till February, there will be none left by the middle of November. It is very doubtful if either Lane's Prince Albert, Bramley's Seedling, or Lady Henniker will keep at all well, though Wellington seems sound enough at present.

Some of the dessert varieties are behaving better, King of the Pippins, Adams' Pearmain, Ross Nonpareil, and Court Pendû Plât, though ripening somewhat out of season, being as yet quite sound and good. Of Cox's Orange Pippin we gathered heavier crops of fine well-coloured fruits than usual, but these are keeping badly. At least one-third of the fruits are already spotted, and I am much afraid the rest will not keep long. When an Essex friend informed me, late in September, that he had then sent large quantities of this superior dessert Apple to the London markets, only getting about 2s. 6d. per bushel for them, I blamed him for his precipitancy, but probably he did the right thing after all. Since then, or about a fortnight later, another large grower of hardy fruit intimated that he also had sold some Cox's Orange Pippin, but either his samples were remarkably good or he found a better market, as his returns were at the rate of 7s. 6d. per bushel. In Somersetshire 3 peck baskets of Cox's Orange Pippin only fetched 1s. 6d., and did not go off very readily at that price. Blenheim Pippin being better known in country districts always sold well till this season, but those fruiterers who store for winter sales are very shy of their best paying Apple, and prices are very low indeed. Blenheim Pippin has also been consigned to Covent Garden in large numbers, and those who have sold the bulk of this variety at fairly good prices will get the best of the bargain, as it is very certain that few Blenheim Pippins will be found in a sound state in December—at any rate, not if they were grown in the south-western counties.

Nothing could well be more disheartening than the outcome of this great season of plenty. Luckily the glutted state of the markets quickly had the effect of making the owners of heavy crops of Apples decide to at once convert these into cider. Persons who had not the proper appliances for making cider sent their fruit to those who were in a position to undertake the work at a fixed charge, and at one time the latter were greatly overworked. Had the bulk of orchard grown Apples been stored, there would, ere this, have been so many heaps of rotten fruit to deplore the loss of, and in any case this year's experience must, to say the least, have a very disheartening effect upon numerous fruit growers who have been led to believe there are fortunes to be made in growing hardy fruit.

It may be that it is only in certain districts that Apples are keeping so badly, though the complaint of early ripening is general enough. That they would ripen abnormally early was to be expected, but surely it was not the excessive heat that is responsible for the premature decay of the fruit. Presumably the American summers are always hotter than ours, yet their Apples keep well, and doubtless will not be long before they arrive in large consignments. It may be that their selections of varieties suit their climate in the same way that ours are the best, as a rule, for this country. Some of our great fruit growers and exhibitors, such as Messrs. Bunyard, Cheal, Pearson, Rivers, Watkins, Veitch, and others who have very complete collections of Apples, including, doubtless, the best of the American varieties, ought to be able to supply some reliable information on this subject, and will greatly oblige by doing so. Are any of the Newtown Pippins, Baldwins, King of Tomkins County, and other American Apples grown in this country in a superior condition? I have no doubt they will be finer in every way, but the question is do they promise to keep better than our own popular varieties? If they do then ought more of them to be grown. Exceptionally hot summers will doubtless be as few and far between in the future as in the past, but all the same it is well to be prepared for them. Already there are unmistakeable signs that the selections of late years, especially in the case of market growers, have been too limited, those who formed them having probably erred in going too much to the extreme in the opposite direction of what our forefathers did. Apples pay best when growers are fortunate enough to have good crops in years of comparative scarcity, and this is more likely to happen when twenty-four instead of about twelve varieties are grown in quantity. Private growers are more given to plant a greater number of varieties, and may perhaps overdo it occasionally, yet may, occasionally, have good cause to be satisfied with what they have done in the matter.

As yet I have not seen nor heard any attempt at explaining the cause or causes of this premature decay of Apples. In several cases the black spots under the skin were showing some time before the fruit was gathered; in others they developed very quickly after storing. Either these unwelcome changes were brought about by the excessive heat, or what is more likely, they would not have occurred had there been no rainfall before the fruit was fit to gather. That Apples, as a rule, would have been undersized had the rain not fallen when it did was evident enough at one time, but I cannot help thinking chemical changes had already taken place, that is to say the starch and acids contained in them were fast being converted into sugar when the change in the weather came. Very premature ripening was prevented by a better supply of sap, but can any scientific observer state what would be the effect of the late addition of so much more watery matter to fruit on the point of ripening? Was it or was it not the cause of our trouble? Perhaps Mr. Abbey may be good enough to express his views on this subject.—W. IGGULDEN, Somerset.

FORCING BULBS.

CHRYSANTHEMUMS, which are now so infinite in variety and attractive in appearance, supply our gardens with such a wealth of flowers during the dullest months of the year, that the forcing of bulbs may with advantage be delayed to a later period than was formerly desirable. Although it is wise, even if not absolutely necessary in many instances, to have a few Roman Hyacinths and Narcissi in flower early in November, it is not till the middle of December, or about Christmas-time, that forced flowers are in great demand. Even then the late varieties of Chrysanthemums supply an abundance of bloom; still the bulk of them are over, and variety among them being less, a change in floral fare is welcomed, if for no other reason than to divert our thoughts from holding in too light esteem the charms and usefulness of the "Autumn Queen," an error which too long familiarity with things and beauty sometimes begets.

The present is a good time to place in heat bulbs for flowering at the time indicated. Roman Hyacinths rank among the most useful for this purpose, as they may be brought into flower quickly with but little risk of failure if good bulbs are obtained. It is surprising what hard forcing they will bear with impunity, provided suitable treatment is given them. If necessary it is quite possible to have them in flower ten days after their introduction in heat, if they have previously made a little more than an inch of growth before being removed from the plunging material. It is not often advisable to force them so rapidly, but whenever the imperious demands of special occasions renders the practice necessary it is well to be prepared with a safe plan of action.

Those which I brought into flower so quickly were managed in the following way. Shallow boxes were placed over the hot-water pipes in front of a pit; the pots of Hyacinths being stood in these, and a little cocoa-nut fibre packed around the base of the pots to keep the soil in them from drying too quickly at that point by reason of their close contact with the heated pipes. When the requisite number of pots were placed in position they received a thorough soaking with warm water, and were afterwards watered almost every day, only failing to do so should the soil appear quite wet when the usual time for watering arrived. No regular temperatures were kept up, but a strong heat was maintained in the pipes throughout, a little air being also left on the back of the pit. This treatment, with a couple of syringings daily, resulted in even potfuls of these useful flowers ten days after being placed in heat. For a couple of days before their removal from the pit they were put on pots near the glass, away from the hotwater pipes, to accustom them to the loss of bottom heat before being transferred to a much cooler temperature.

Tulips of the Duc Van Thol type bear hard forcing extremely well, and if they are allowed to make fully 11 inch of growth before being taken from the plunging material, and then gradually inured to light in cold pits, they are then in the right condition to bring into flower quickly whenever there is a demand for them. The Double Roman Narcissus is excellent for early forcing; but as soon as the improved form of Paper White (Snowflake) comes in in bulk the first-named is not wanted. If the flowers are required for cutting only the majority of Narcissi bear sharp forcing well. I find, however, that pots of various sizes, containing from five to nine bulbs, are extremely useful and effective for arranging singly in vases; those, therefore, that are required for this purpose should be kept quite close to the glass in a rather cooler temperature, otherwise the leaves become drawn and weedy looking.

Whenever it is absolutely necessary to force potfuls intended for vases on quickly they may be placed on a shelf near the glass in a Cucumber house, or forcing house having a similar temperature, till the flowers begin to show colour. If the pots are then removed to a cooler structure both leaves and flower stems will become considerably strengthened by the time the flowers are fully expanded. Poeticus ornatus is a grand Narcissus for bringing on in a gentle heat. If forced too sharply a large percentage of flower buds which never open are produced. Sir Watkin, which is now considerably reduced in price, is, I think, the variety of the future. Hitherto it has been too choice to subject to sharp forcing, but this season I hope to try its capabilities in that direction.

Freesias seem to become more popular each year, as their culture is better understood. If the bulbs are potted in light rich soil, the pots plunged in cocoa-nut fibre till an inch of growth has been made, and are then removed to a shelf in a cool house, they will succeed admirably. The earliest plants thrive well if grown in an intermediate temperature. Allium neapolitanum is also an extremely useful bulbous plant, which requires exactly the same treatment as Freesias. It ought, I think, to be more generally

Much of the success or failure experienced in bulb forcing is

due to the manner in which this operation is performed. I find there is a general tendency among young men to allow the soil to get into about the same state of dryness before water is given, no matter what position the pots occupy, or what temperature they are grown in. The effect of this is sometimes ruinous to the plants. When growing in a strong heat, especially if the pots are near the hot-water pipes, the soil ought to be kept constantly moist, for if it becomes thoroughly dry many of the roots are destroyed. On the other hand, when grown in cool houses where but little fire heat is employed, the pots should ring sharply when rapped, before water is given.

Notwithstanding much which has been said to the contrary, I consider frequent applications of liquid manure to be of great benefit in helping to swell the individual flowers up to their fullest size; for although each bulb already contains the embryo flower spike, strong healthy roots are required to feed and develop it, and in liquid manure these roots find stimulating food, in a form

most easily assimulated.—W.

SOME NEW VIOLAS.

On looking through my notes of new Violas for this year I find over a hundred varieties altogether have come under my notice. notes, however, I will deal principally with those sent out in 1893, and include a few varieties of 1892 because of their great beauty. I will refer to the new kinds yet to be introduced in another paper.

The early part of 1893 was all that could be wished for the Viola, mild and genial, and with such a wealth of bloom everywhere. In the south and the midlands, however, we had a very long spell of tropical heat and drought, with a pitiless downpour of brilliant sun heat, which drove vegetation into a state of misery, and Violas were in so many instances during the summer scorched up, and they had to bear a terrible infliction of brown aphis.

For bedding out many of the varieties in cultivation are very suitable, but I have no intention of touching upon these exclusively. I wish to draw attention to some of the best of the newer sorts.

Blue Bonnet (J. D. Stuart).—White with a broad edging or margin of height number and distinct

of bright purple, and distinct.

Bridesmaid (Dean).—Pale primrose and quite rayless and fine. Bridesmaid (Dean).—Pale primrose and quite rayless and nine.

Comet (McKie).—Rich rosy purple with a darker centre, fine.

Blue Gown (Dr. Stuart).—Blue self, dwarf and very free blooming.

Blush Queen (Dr. Stuart).—White tinted with blush.

Bridal Wreath (Dr. Stuart).—Pure white, very like Sylvia.

Mrs. D. Fergusson (Irvine).—Pure snow white, good form, very fine.

Mrs. MeDonald (Irvine).—Violet purple clouded with blue tinted

lilac, fine form.

Countess (McKie).—Shaded rosy plum and purple, fine.

Duehess (McKie).—Shaded lilac pink with lighter top petals, fine.

Edina (Dobbie & Co.).—A grand variety and so distinct; rich dark violet centre with a bright blue lilac margin, very handsome

Favourite (Dobbie & Co.).—Light blue; an excellent bedder.
Golden Flake (J. D. Stuart).—Deep yellow, good habit, a valuable

Hyaeinth (Baxter).—Shaded white and lavender, blue centre, and

quite distinct. Laveroek (J. D. Stuart),—A "skylark" style of flower, but an

improvement, and fine. Lemon Queen (Dobbie & Co.).—A little deeper in colour than Brides.

maid; fine. Magnet (McKie).—A rich coloured flower, and extra fine; a very handsome variety.

Mrs. Hay.—A very distinct striped flower, violet purple stripes and white ground; fine.

Peter Barr (Barr).—Yellow, bordered with pale pink; a peculiar

flower, and really a miniature Pansy.

Pieotee (Dr. Stuart),—White with a wire margin of blue lilac on

each petal, and small flowers, very pretty and distinct.

Rob Roy (Dobbie & Co.).—An improved "Vernon Lee," yellow, with with the top petals chocolate coloured with small gold band on each.

Sylvia (Dr. Stuart).—Creamy white self, type of Countess of Hope-

toun. White Flag (Baxter).-White, of great substance, and with long footstalks.

White Duchess (Baxter).—This is the "Duchess of Fife" with a white instead of yellow ground colour, a charming variety which will become popular.

The foregoing I have seen, and they are of the ordinary large flower section of Violas, but there are many others which were sent out last year for the first time, some of which I have not seen, and of others the plants came to hand late in the spring and had no chance of doing well owing to the very hot weather.

The pretty miniature section of the Violetta type has an earnest champion in Mr. George Steel, late of Heatherslaw and now of Etal in Dumfriesshire, who has discarded all Violas not of the Violetta type, so as to devote attention entirely to the latter. Dr. Stuart of Chirnside originated them, and is the raiser of Violetta and other pretty varieties.

The Violetta section is distinct in the smaller growth, which is of more procumbent habit, and in giving a profusion of small, well shaped flowers, all remarkable for their strong violet fragrance and dwarf bedding habit. Violetta itself is a white, and other pretty varieties are Marginata, Lady in White, Old Gold, Summer Cloud, Jeannie Turnbull, Mrs. Joseph Oliver, Maggie Steel, Mrs. George Finlay, and others, and some charming new varieties to be sent out in the spring by Mr. Steel. I have seen almost all, and there are many gems amongst the newcomers.

Of the more recently introduced Violas the following are all fine—viz., Annie King, Aeeushla, Colleen Bawn, Dorothy Tennant, Duehess of Fife, Golden Gem, H. M. Stanley, H. W. Stuart, Mrs. Frater, Mary Gray, Rothes, and Wonder. These are all aequisition to eolleetions.—W. D.

Plants that have well ripened pseudo-bulbs, and have been resting for some time, may be introduced again into heat, when they will be induced to flower. The flowers are always useful, and may with care and judgment be had over a lengthened period by starting plants into growth at different times. Plants that have completed their growth should be placed into a cool, dry, airy position after they have been properly hardened. A late vinery in which Grapes are hanging will be a good place for them. Even in this position expose them to the sun, and give sufficient water only to prevent their pseudo-bulbs shrivelling.—Specialist.

ORCHIDS AT FOREST HILL.

Whilst passing hastily through the Stanstead Road Nurseries of Messrs. J. Laing & Sons, Forest Hill, last week, I noticed that the Orchids made a good display. Several forms of Cattleya labiata were specially good, and the same may be said of the numerous Cypripediums. Amongst the latter the beautiful C. Spicerianum was most conspicuous, the flowers of this popular species always showing up well. A few Odontoglossums were flowering, and the whole of the plants, of which many are grown, presented a remarkably healthy appearance.—C.

DISA VEITCHI X TRIPETALOIDES.

This is a new hybrid raised at Kew, where, according to a correspondent in the "Garden and Forest," it recently flowered for the first time. As will be seen from its parentage, it combines three distinct species, D. Veitchi being the result of crossing D. grandiflora with D. raeemosa. These hybrids are much easier to cultivate than most Orchids, and they increase rapidly. The new hybrid has a crowded rosette of sturdy green leaves, from the centre of which springs a scape as thick as a swan's quill, and 1½ foot high. The flowers are as numerous as on D. racemosa, nearly 2 inches across, and coloured deep rose. These tufted Disas can be recommended to anyone in search of promising material to breed from, as it is scareely possible to make a mistake in crossing and raising them from seed.

FLORAL NOMENCLATURE.

As to the proper pronunciation of "Glädĭölüs," I may mention that more than twenty years ago I asked a distinguished classical scholar, of world-wide renown, for the correct pronunciation of that word. He replied, "The accent should be on the first syllable, as in Gladius; neither the i nor the o should be emphasised." Since then I have been content to follow such authority. The word, so rendered, may not run off the tongue so trippingly as Gladiolus or Gladiolus, but that it is correct I have, from that day, had no doubt. I have never heard, as Mr. Woliey Dod states on page 399, the word in question pronounced Gladjolus, but I have often heard great stress laid on the first syllable and the following i (pronounced e) given very short, which might give the effect of a j.

As to "West Anglian's" letter (page 399), it would indeed be a consummation devoutly to be wished, though searcely to be hoped, even in these days of County Council education, that every gardener should possess a thorough knowledge of Latin, Greek, and French. Until that event occurs there will be many mistakes in spelling and still more in pronunciation; but from perusing "W. A.'s" list of errors it seems very probable that many of them arose from the endeavour to copy almost illegible labels. As for myself I have always considered that the mastery of long Latin, Greek, and French names, without a glimpse of their meaning, is one of the gardener's hardest tasks, and the more letterperfect he becomes in his self-imposed lesson the more I respect him for his application. It is an easy thing for a man who is a fair classic and modern linguist to remember these names, for each word has for him its

meaning; not so for him who has no knowledge of any tongue but his own; with him it has to be parrot-learning, infinitely more difficult.

Then when a name is learnt it has often to be re-learnt, for lanei folium becomes speciosum; Spiræa, Hotcia. Tritoma changes to Kniphofia; Hyacinthus to Galtonia; while Clivia takes the place of Himantophyllum. Gardeners may well afford to ignore the jibes of thoughtless youth, in the knowledge that those of maturer judgment fully recognise both the difficulties under which they labour and the commendation they merit in successfully overcoming the same.—S. W. F.

CULTURE OF FRANCOAS.

FRANCOAS are exceedingly useful for the embellishment of the greenhouse or conservatory or for house decoration, their elegant appearance and floriferous character eminently suiting them for this purpose. When associated with other plants the long white spikes of F. ramosa, together with the beautiful pale red F. appendiculata, cannot fail to evoke the admiration of everyone, and I feel sure that the more they are known the more they will be appreciated. They are comparatively easy of cultivation, and, although the usual time of flowering is from July to September, may by a little judicious arrangement be had in bloom nearly all the year round. A compost of good fibry loam, leaf soil, and sharp sand will be found an excellent mixture for them. For general decorative purposes plants in 7-inch or 8-inch pots are large enough, but where large specimens are required 10-inch and 12-inch pots should be used.

Young plants may be raised either from seed, euttings, or by division; all of which methods should be resorted to in order to procure a long succession of bloom. Old plants that have been flowering throughout the summer will now be making new growth, therefore no time should be last in dividing them. After the plants are turned and of the nets

be lost in dividing them. After the plants are turned out of the pots divide them in two or three parts, and place in similar sized pots to those in which they were previously grown. After repotting water must be sparingly administered until the roots have taken full possession of the new soil. During the winter a temperature of from 45° to 50° should be maintained, and if attended to they will commence throwing up their flower spike about the beginning of April. For propagating by cuttings the offsets, which are freely produced from the base of the old plants, should be procured. The cuttings should be inserted singly in small pots filled with a similar compost to that recommended above. Give water through a fine rose after insertion, to settle the soil, and stand the outtings in a temperature of from 50° to 55°. When well rooted they

Give water through a fine rose after insertion, to settle the soil, and stand the euttings in a temperature of from 50° to 55°. When well rooted they should be placed in 5-inch pots, and grown in the temperature advised for old plants. Immediately the roots reach the sides of the pots the plants should be placed in others 7 inches or 8 inches in diameter.

Where the earliest flower spikes were not removed abundance of seeds may now be procured, and these should be sown as soon as gathered. In preparing the seed pan it is essential that good drainage be obtained, after which fill with a mixture of light sandy soil. Seatter the seeds thinly and evenly over the surface, slightly covering with soil. Most growers recommend raising these plants in heat, but I prefer growing them under cool treatment. It is of great importance that the young plants be pricked into pots or pans when large enough where they can have plenty of space and light, otherwise they will quickly become drawn, and failure must be the result. Before the plants become crowded they should be placed in 5-inch pots and stood on a shelf in a cool house, giving subsequent repottings as may be necessary. When the pots are full of roots liquid manure may be applied every other watering with great advantage. In the spring, when all danger of frost is over, the plants may be placed in a cold frame, letting them remain there till the last week in August, when remove to the greenhouse. If the foregoing instructions are properly carried out a good supply of flowers may be obtained. Some cuttings I inserted last autumn are now flowering profusely, as also are many seedlings which were raised at the same time.—G. PARRANT.

THE CARNATION AS AN ANNUAL.

The first introduction of the Marguerite Carnation was from the Continent, and for usefulness as a decorative flower it is now grown extensively. Mr. C. H. Herbert has been inspired to work on this strain by cross-fertilisation, using a grand scarlet bizarre as a pollen parent with very satisfactory results. The variety in colour, form, and marking is greatly diversified. Some of the blooms are clean cut at the edge approaching the petal of the stage varieties; others are freely serrated and beautifully fringed, whilst the colours are as varied as can be conceived. Then the flaking, splashing, spotting, and the feathering adds greatly to their value. Blooms sent me by the raiser have stood in water for more than a week, and they figured as a novelty and excited a considerable amount of admiration at our Chrysanthemum Show. The perfume is delightful, and the colours in the chaste green setting are beantiful.

For mixed beds and borders they will equal our old friend the Verbena, and for window and conservatory decoration I can conceive their rivalling the Cineraria, the Calceolaria, the Primula, and the Cyclamen, as the warm tones during the cold months will be so cheering. Mr. Herbert tells me that he is this season working on the same stock with the yellow grounds and fancies, so that the possibilities as to the future of the Carnation as an annual we may only imagine.—W. WARDILE.

MR. MAWLEY'S ANALYSIS.

WITH great respect for Mr. Mawley's analysis, I yet think there is something in Mr. Grahame's reasoning. I have no doubt that Mr. Mawley's results are as near perfection as possible, but as these results are expressed in "crude figures," it seems to me fair to state that the new Roses present an insuperable difficulty to that mathematical accuracy which should be expressed by figures. They do not afford the same data for calculation as the other Roses, and therefore the results founded on their data do not stand upon the same footing as the other figures in the list. This is only an outside view. Mr. Mawley has probably forgotten more about statistics than I ever knew, but it is well sometimes to take outside views into consideration.

In the old "Rose elections" the opinions of rosarians were the only data, and the result, of course, was only the general opinion; but this was, if the electors were numerous and representative enough, fairly without cavil.—W. R. RAILLEM.

A GOOD Rose, like good wine, requires no special commendation or assistance by the principle of selection, and as certain vintages year by year work to the front in the estimation of connoisseurs, so a good Rose as it becomes known is more and more cultivated, and therefore exhibited by the best rosarians. Time therefore would do all that was requisite in placing a good Rose in its proper position. Impostors soon disappear, effete ones die out, and genuine good varieties work to the front. If Mr. Mawley is, by an elaborate system, mathematically correct, I think it would be satisfactory for him to clearly explain this method.

To show that other authorities of high standing think ordinary figures (the analysed results of the experience reported by a large number of rosarians) to be sufficient to establish the position and habits of all our greatest Roses, I would instance and recommend the perusal of the R.H.S. report on the Rose Conference held at Chiswick in 1889. This, in my opinion, is the most valuable digest on the cultivation of Roses, and the results thereof, which has yet been published. Nothing but actual figures are there used or discussed, and the results arrived at are given with clearness and mathematical precision.—Charles J. Grahame, Croydon.

As Mr. Grahame (page 418) claims that he has friends who adopt his views on the above matter, perhaps it would be well if they would say so in the *Journal of Horticulture*. In the meantime allow me to express my feeling that the attack he has made upon Mr. Mawley is entirely unwarrantable.

Mr. Mawley's analysis I have for many years looked forward to as the crowning of the Rose season, and I fully endorse your remarks of appreciation thereof. Painstaking care and thoroughness have distinguished all of them, and these characteristics I would commend to the notice of your correspondent. Long years before Mr. Grahame became a member of the N.R.S. Mr. Mawley was doing valuable work for it, to which work the Society owes much of its position to-day. If, therefore, his work was now to be attacked it would have been more becoming if the attack had proceeded from someone who could claim to have done something for the Rose at least approaching in value to what Mr. Mawley has done.

As you are aware, I have usually signed the notes I have sent to your columns, but remembering the tremendous onslaught which a gentleman had to endure, who ventured to differ from Mr. Grahame last year, I take refuge on this occasion in the name of my county—Bucks.

POMONA FARM NURSERIES, WITHINGTON, HEREFORD.

THE above is the largest fruit tree nursery in the fertile county of Hereford, and very easy to reach, as it adjoins Withington Station on the Great Western and London and North-Western railways, also about four miles from the ancient city. Having arranged a convenient day with Mr. J. Watkins, the well-known proprietor, to see his famous fruit grounds, he met the writer at Hereford Station, with a sharp trotting horse and conveyance, driving direct to his Whitecross Nursery, out of the city. There was a magnificent collection of fruit trees of all kinds and forms, clean, and in the best of health, very small trees being well supplied with fruit buds. The planting season being an early and favourable one, great activity was exercised in lifting trees and executing orders. In one instance 500 standard Apple trees were being packed at the time of my visit, and better rooted trees could not be desired.

Like all nurserymen Mr. Watkins has trees to suit all classes of buyers, and standards, half-standards, trained pyramid and bush trees are in vast numbers. Dumelow's Seedling is very much to the fore here, and if this excellent Apple would answer everywhere the same as with Mr. Watkins, nothing would pay better to plant. All the trees ranging from small maidens to tall standards are covered with large fruit buds, and

entirely free from canker. Ecklinville Seedling is in great demand, and a large quarter is occupied by it. Annie Elizabeth, Cellini, and King of the Pippins cover a large space. Beauty of Bath and Bramley's Seedling Mr. Watkins considers to have a great future as Apples suitable for both market and private establishments, consequently many are grown to meet any requirements. Potts' Seedling is another favourite, and the same remark applies to Worcester Pearmain, Stirling Castle, Yorkshire Beauty, and Warner's King; in fact, all the leading market varieties are grown extensively in the Whitecross Nursery. Hereford Beefing is in much favour by farmers, and many trees are sold to them. I think they are wise to plant such a variety that is valuable for market, owing to its high colour; and if prices rule low it is equally valuable for cider making. Many other varieties of cider Apples are grown in great numbers, for which a good demand is found. Some of the choicer Apples are worked in a lesser degree, such as Ribston Pippin and Mr. Gladstone; but though these are only produced by hundreds instead of thousands, they are equally healthy and vigorous, and free from canker. There are many other sorts of Apples, too numerous to name, that are grown in very large numbers. Pears are also grown here, but to a less extent than at the Pomona Nurseries, the principal kinds consisting of Williams' Bon Chrêtien, Marie Louise, Louise Bonne of Jersey, and others, all being clean and admirably grown, and of all forms.

A large plot is filled with all the best and most famed Lancashire prize Gooseberries, each plant having a clean stem of about I foot from the soil to the branches. Winham's Industry, Whitesmith, and Keepsake are very largely grown. Keepsake is a favourite with Mr. Watkins, as he finds it one of the best market varieties, producing heavy crops of large berries almost from its infancy. Crown Bob is another good kind, and represented by a large stock, also many others. Currants, especially Black, are in great force, and finer well rooted plants could not be desired. Black Naples, Ogden's Black, Lee's Prolific, and Black Champion (Carter's) are grown by thousands. Amongst White Currants, White Champion is praised highly, as it produces the finest berries and clusters in great profusion, and is here considered by far the best in its class, while similar honours are awarded to Le Conde among the Red, being an improvement on the well-known Raby Castle Currant.

Plums are only grown on a limited scale at the Whitecross Nursery, so we pass on to the Pomona Nurseries. About a mile before reaching there we come to some of Mr. Watkins' fruit plantations, in which fruit is grown for market purposes. Standard fruit trees are planted in long lines with bush trees between in the lines, and between these lines are Gooseberries, Raspberries, Strawberries, and Currants. When it is stated that Mr. Watkins has about 100 acres of orcharding, independent of his nursery grounds of 60 acres, it will be at once apparent that his opinion is valuable as to the varieties of each kind of fruit most suitable to plant for profit, and a conversation with him on these matters is not only interesting but extremely educational.

On leaving these fruit plantations we arrive at the top of a hill over-looking the nurseries, Hop yards, residences, cider mills, packing sheds, and offices. After a short drive through the nurseries we adjourn to Mr. Watkins' house, where we rest for a little time, and again sally forth. I should mention here that Mr. Watkins has adopted an excellent plan on his house worthy of imitation. Instead of planting the usual crnamental climbers, cordon Pears have been planted on the favourable aspects. The trees have grown splendidly, and produce magnificent fruit. Not only are the trees highly attractive when in bloom but very useful in supplying first-class fruit, much of which finds its way to the exhibition table. Leaving the house we pass to a field filled with stocks for working next spring, and about to be added to the nurseries. Thence we proceed to view the cider fruit.

Imagine a large grass field covered with bright red and golden fruit, varying from 2 feet to $2\frac{1}{2}$ feet deep, weighing hundreds of tons, and then some idea may be formed of the quantity of cider manufactured. Each variety is kept separate and carted away to the mill, and here a few remarks on the mill itself may not be out of place. As the fruit is brought into this department it is shot into a large room, in which is a huge hopper for filling a crushing or pulping machine, the revolutions of which are 2000 per minute, keeping a man busy with a large shovel supplying this hungry monster with fruit. After passing through this process it is conveyed by machinery to another part to have the liquid extracted, which runs through a large 2-inch hose full bore into great vessels. All this work is done by steam power, and on the most approved principles, and as the work is completed the cider is bottled or put in casks, according to quality or demand. One noteworthy point was the extreme cleanliness prevailing in every portion of the manufactory. For this reason alone Mr. Watkins well deserves the large orders he obtains for his cider and perry. The making of the latter was over at the time of my visit, and except that Pears are used instead of Apples the process is much the same.

Opposite the cider factory is the fruit room containing at least 300 varieties of Apples of large size, and mostly of exquisite colour. It would take up too much space to name even the most striking in detail, but the following are worthy of a place in every exhibitor's collection—Belle de Boskoop, Atkins' Seedling, Flanders Pippin, Devon Red (very high colour), Lady Waldron, Crimson Costard, Warner's Seedling, similar to Washington but heavier, Backley's Seedling, Scarlet Tiffing, and Roundway Magnum Bonum, very fine; some of the fruit must weigh a pound each. Many other comparatively unknown varieties deserved noting, but time would not permit. Leaving the fruit we pass to the trees in the nursery, which are in far greater numbers and variety than

at Whitecross. Something like 60 acres are filled with Apples, Pears, Plums, Cherries, Apricots, Peaches, Nectarines, and Damsons, which are planted in long rows containing 2000 trees per row. All the trees are in admirable health and condition, and not a trace of American blight to be seen. To give some idea of the number, I may state that in one portion of the fruit plantation over 600 distinct varieties of Apples are grown, besides a great number of British, Continental, and American sorts on trial. Plenty of room is allowed the trees, which are in bush form and lightly pruned, merely thinning out the shoots where too thick or crossing. Many varieties of Apples not much grown are to be seen in these nurseries, some of which deserve extended culture. One of these not much known outside the county is Stoke Edith Pippin, somewhat resembling King of the Pippins, but larger, with a higher colour and longer keeping qualities, also excellent for dessert.

A collection of native Japanese and American Plums are on trial,

but it is doubtful if they will prove profitable in this country. appears to be an acquisition in the trial department is an American Raspberry named Cuthbert; it is a free fruiting summer variety, and has this season produced a fair autumn crop. At the time of my visit (November 2nd) the fruit was in large clusters and of exquisite flavour. Another Raspberry that promises well is the Black Raspberry; the canes are black in colour, strong, short-jointed, and look as if they would be self-supporting. Superlative and other kinds are grown extensively; also Currants, Gooseberries, and Nuts in great variety and in admirable condition. Strawberries are represented by immense stocks of all the known varieties, including Alpines. All the best kinds are grown by thousands in small pots, as well as numbers in bcds. Contrary to my expectation, John Ruskin has been in great demand this season. It seems to revel in the Withington soil-in fact, all the varieties are exceptionally strong and healthy.

Not only fruit and fruit-producing plants are grown at these nurseries, but adjoining are fields devoted to Potato culture, principally for seed purposes, in which Mr. Watkins does a large trade. Several varieties of fine quality have originated here, and no doubt many readers will have seen the grand samples staged by Mr. Watkins at some of the large agricultural and horticultural shows. Hops are also an important crop. A large Hop yard faces the cider factory, and thousands are grown for sale annually. The demand has been very heavy this season for Hop

roots at high prices, still a good supply is left.

Leaving this part, we make our way to the station, and having a few minutes to spare we inspect some more fruit hurriedly in buildings near the station. Here were magnificent Pears in great variety which have done excellent service at shows. Tons of Blenheim Orange and other Apples were stored, to be sold later on as prices advanced. At the back of these store rooms are other packing sheds in which men were busy packing and conveying trees to the station only a few yards away. A line of rails runs right through a portion of the nursery and up to the cider factory, enabling the proprietor to execute heavy orders of each in the least possible time. Time expiring, I have to leave after a very interesting visit, and greatly obliged to Mr. and Mrs. Watkins for their kindness and hospitality, my only regret being that I did not see Mr. Vaughan, the able foreman, who was winning premier honours for Mr. Watkins at Portsmouth for collections of Apples and Pears.— S. T. WRIGHT.

FRITILLARIA BREVICAULIS.

THIS Fritillaria is a dwarf-growing plant, rarely exceeding a height of 9 inches. The flowers, as will be seen by referring to the illustration (fig. 64), are rather small and produced singly as well as in pairs. They are of a tawny colour, and although not particularly attractive, the species is well worth growing. Our engraving was prepared from a sketch of a plant growing in the Royal Gardens, Kew, last spring. Like other choice Fritillarias the species under notice requires a sunny and sheltered position, a deep sandy loam suiting it admirably. It can also be grown in pots for the embellishment of the greenhouse in spring.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 14TH.

THERE was a good display of Orchids and Chrysanthemums at this meeting, and many noveltics were shown, but it was impossible to see the true colours of the flowers, owing to the bad light in the Drill Hall. Fruit was not so well represented as usual, but some fine Potatoes were

FRUIT COMMITTEE.—Present: Philip Crowley, Eq. (in the chair); Messrs. J. Lee, T. F. Rivers, G. Taber, T. J. Saltmarsh, W. Warren, J. A. Laing, W. Balderson, F. Q. Lane, James Smith, H. J. Pearson,

J. Willard, and Dr. Hogg.

As before mentioned fruit was not extensively shown. Mr. W. J.

Godfrey, Rolle Street, Exmouth, sent a dozen clusters of Apples of a second growth. The fruit of such varieties as Grenadier, Lord Grosvenor, and Domino were about half grown, whilst others were larger than Walnuts. A vote of thanks was accorded for this interesting exhibit. Mr. J. Edmeads, Bevingford, Uckfield, sent a dish of Edmeads' Seedling Apple, a fine well-coloured variety, but no award was made. Mr. W. Jenkins, The Willows, Abergavenny, had a dish of Monmouthshire Beauty Apples, and Mr. W. H. Divers, Ketton Hall Gardens, sent samples of Barnack Beauty in ripe condition. A vote

of thanks was accorded in each case. Mr. J. Crook, Forde Abbev, Chard, had a dish of Coe's Late Red Plum, and Mr. W. Roupell, Harvey Lodge, Roupell Park, staged a basket of splendid Newton Wonder Apples (vote of thanks), and Mr. J. Fitt, had Bananas in good

Messrs. H. Cannell & Sons sent a large collection of Potatoes, clean well-grown tubers that deserved the silver Banksian medal recommended. They exhibited a tuber of The Bruce that weighed $2\frac{1}{2}$ lbs, Mr. Leach, Albury Park Gardens, Guildford, sent Leach's All the Year Round Parsley, and an extensive collection of Celery came from the Society's gardens at Chiswick,

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); Messrs. R. Owen, H. Herbst, C. T. Druery, G. Stevens, W. C. Leach, F. Ross, J. Jennings, W. Bain, C, Jeffries, W. Furze, C. E. Pearson,

FIG. 64.—FRITILLARIA BREVICAULIS.

T. Baines, H. Cannell, J. D. Pawle, J. T. Bennett Poë, E. Mawley, G. Paul, J. H. Fitt, Owen Thomas, C. E. Shea, Peter Barr, and Rev. H. H. D'Ombrain.

Chrysanthemums were the principal exhibits brought before this Commictee. Messrs. J. Veitch & Sons, Chelsea, sent a large group tastefully arranged, comprising all the leading varieties (silver Flora Amongst others were some exceptionally fine blooms of Lord medal). Amongst others were some exceptionally fine blooms of Lord Brooke, Viscountess Hambledon, Robert Owen, and Charles Blick. A plant of Mdlle. Therese Rey was also shown by Messrs. Veitch, and an award of merit was adjudged. Mr. W. Wells, Earlswood Nurseries, Surrey, had a splendid collection of cut blooms of all the latest novelties in the Japanese, single and Anemone-flowered forms (bronze Banksian medal). Mr. W. Salmon, West Norwood, sent some bouquets and baskets of Chrysanthemums (bronze Banksian medal), and Mr. G. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, had a collection of blooms charmingly arranged with small Palms and Ferns (silver Banksian medal). Mr. C. E. Shea, The Elms, Foots Cray, Kent, had a collection of Japanese varieties arranged in a manner that he offered as a suggestion for staging cut Chrysanthemums. The stands were in sections of about 6 inches in width, three blooms being staged in each section (bronze Banksian medal). An award of merit was adjudged for a bloom of Mdlle. Therese Rey, shown by Mr. Shea.

In a competitive class for a collection of cut Chrysanthemums there were several exhibitors, Mr. J. McLeod, Dover House Gardens, Roehampton, had a fine collection of Japanese incurved and the smaller flowered types, but was disqualified for non-compliance with the schedule. Mr. G. Wythes was then placed first, Mr. Thomas Osman,

Ottershaw Park, Chertsey, second, and Miss Debenham, St. Albans, third. Mr. W. Slogrove, Gatton, Kergate, was first for eight new Chrys-Mr. G. Wythes was anthemums showing varieties now in commerce. second also in this class with smaller flowers of similar varieties.

Messrs. H. Cannell & Sons, Swanley, Kent, sent a very fine collection of Chrysanthemums and Zonal Pelargoniums (silver Flora medal). The former comprised all the novelties of the day in splendid condition. The Pelargoniums were also excellent, and made a grand display. Mr. R. Parker, The Gardens, Impney Hall, Droitwich, sent a collection of cut Chrysanthemums, arranged with Ferns and small plants of Ficus repens (silver Banksian medal). Mr. Robert Owen, Maidenhead, sent six boxes of new Chrysanthemums, and awards of mcrit were adjudged for the following varieties:—John Bunyan, Lord Rosebery, Niveus, Golden Wedding, Rose Wynne, and Wilfred Marshall. These are described below. Mr. Crawford, Reigate, showed Chrysanthemums, and a bronze Banksian medal was recommended.

Messrs. J. Veitch & Sons sent a box of Begonias John Heal and Mrs. John Heal, the last named a large flowcred variety. The same firm secured a first-class certificate for Dracena Jamesi, which is described elsewhere. Sir Trevor Lawrence, Bart., sent a basket of Primula

Forbesi, for which a first-class certificate was awarded.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); Dr. Masters, Messrs. J. O'Brien, E. Hill, Thomas Statter, T. W. Bond,

Dr. Masters, Messrs. J. O'Brien, E. Hill, Thomas Statter, T. W. Bohu, C. J. Lucas, H. Williams, and H. Ballantine.

Messrs. Hugh Low & Co., Clapton, sent a small group of Orchids tastefully arranged with Crotons and other foliage plants (silver Banksian medal). Messrs. F. Sander & Co., St. Albans, were represented by a group of Orchids, comprising Calanthes, Cattleyas, and some charming Cypripediums (silver Flora medal). R. J. Measures, Esq., Cambridge Lodge, Camberwell, sent a charming collection, amongst which were the beautiful Cypripedium insigne Sanderæ, C. Exul. C. × Bellona. C. insigne Ernesti, some varieties of Cattleya amongst which were the beautiful Cypripedium insigne Sanderæ, C. Exul, C. × Bellona, C. insigne Ernesti, some varieties of Cattleya labiata, and the brightly flowered Sophronitis grandiflora (silver Flora medal). Mr. T. Statter, Stand Hall, Manchester, sent various Cypripediums, amongst which C. Southgatense superbicns (first class certificate), and C. Ariadne were conspicuous. Mr. Joseph Fitt Panshanger, Hertford, sent a variety of Cypripedium Leeanum, distinct from and smaller than the type. F. S. Moseley, Esq., 448, West Strand, had a seedling Cypripedium

had a seedling Cypripedium.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, had
Lælio-Cattleya Statteriana (first-class certificate), Lælis-Cattleya pallas superba, and several distinct Cypripediums, including C. × Euryades, and C. Œnone. Messrs. B. S. Williams & Son staged a very fine collection of Cypripediums, Cattleyas, and Odontoglossums tastefully arranged (silver Flora medal). Mr. E. H. Woodall, Nicholas House, Scarborough, sent a plant of Cypripedium insigne var. albo-purpureum. Messrs. W. L. Lewis & Co., Southgate, N., staged a collection of Cypripediums, Cattleyas and Odontoglossums, which made a bright display (silver Banksian medal). Several Orchids that have not been mentioned were

certificated, but these are described below.

CERTIFICATES AND AWARDS OF MERIT.

Chrysanthemum Chas. Davis (J. Veitch & Sons and G. Stevens).— The well-known bronzy yellow sport from Viviand Morel (award of merit).

Chrysanthemum C. J. Salter (W. Wells). — A pretty Anemone-flowered variety raised by Mr. Wells. The flowers are medium in size and of a terra cotta shade (award of merit).

Chrysanthemum Duke of York (H. Cannell & Sons).—A massive incurved Japanese variety, broad purplish crimson florets with a silvery pink reverse (award of merit).

Chrysanthemum Golden Wedding (R. Owen, G. Stevens, J. Veitch and Sons, and H. Cannell).—A fine Japanese variety, rich golden yellow

(award of merit).

Chrysanthemum Mdlle. Thérèse Rey (C. E. Shea and J. Veitch and Sons).—A charming creamy white Japanese variety which is figured on page 449 of this issue.

Chrysanthenum Wilfred Marshall (R. Owen).—An English-raised incurved Japanese variety of a bright yellow colour (award of merit).

Chrysanthemum Rose Wynne (R. Owen).—An incurved Japanese variety, bloom large, white heavily tinted pink (award of merit). Chrysanthemum Niveus (R. Owen).—An American reflexed Japanese

variety, of good build, white tinted pink (award of merit). Chrysanthemum Robert Petfield (R. Owen).—A fine incurved variety,

blooms of great depth and substance (award of merit).

Chrysanthemum Lord Rosebery (R. Owen). — An English-raised incurved variety; blooms large, deep, and in colour a shade lighter than Lucy Kendall (award of merit).

* Chrysanthemum John Bunyan (R. Owen).—A charming Anemone-flowered variety of a striking yellow colour (award of merit).

Croton Russelli (H. Low & Co.).—A broad-leaved showy kind, the foliage being green, richly spotted and veined with yellow and red

(first-class certificate).

Cypripedium Ashworthæ (E. Ashworth, Esq.).—This hybrid is the result of a cross between C. Leeanum superbum and C. selligerum majus. The dorsal sepal is very fine, chiefly white, with a green base and spotted purple. The sepal and lip are bronze purple (award of merit)

Cypripedium Leeanum var. James Hamilton (F. Sander & Co.).—A beautiful variety of C. Leeanum, the chief feature being the fine white dorsal sepal (award of merit).

Cypripedium southgateense superbum (T. Statter, Esq.).—This is

apparently the result of a cross between C. bellatulum and C. Harrisianum. The sepal and petals are heavily spotted purplish crimson, and likewise is the lip (first-class certificate).

Cypripedium Swinburnei Stand Hall var. (T. Statter, Esq.).—A

pretty form, with sepals and petals densely covered with browish spots,

the lip being shiny brown (award of merit).

Dracæna Jamesi (J. Veitch & Sons).—A narrow-leaved Dracæna of an ornamental character. The centre of each leaf is dark brownish red,

the margins being bright red (first-class certificate).

Lælio Cattleya Statteriana (J. Veitch & Sons).—An exceedingly pretty bigeneric hybrid, being the result of a cross between Cattleya labiata and Lælia Perini. The sepals and petals are of a rosy mauve shade, and the lobe of the lip is a rich purplish crimson (first-class

Pleione maculata alba (G. W. Law, Esq.).—A chaste variety, with small white flowers, a tinge of lemon yellow being noticeable in the

throat (award of merit).

Primula Forbesi (Sir Trevor Lawrence).—A small-flowering species from China. The flowers are rosy lilac colour, and obviously very freely

produced (first class certificate).

Stanhopea Lowi (H. Low & Co.).—A very fine species with large creamy white flowers, faintly spotted with crimson (award of merit).

THE LECTURE.

At the afternoon meeting, Mr. R. Parker, The Gardens, Impney Hall, Droitwich, read an excellent paper on the culture of Chrysanthemums. As a successful grower, Mr. Parker dealt with his subject in a practical manner, detailing the most salient points connected with the cultivation of these popular flowers. The essayist illustrated his remarks with some well grown plants and very fine blooms. A vote of thanks to Mr. Parker was unanimously accorded.

EVENTS OF THE WEEK .-- Apart from the Chrysanthemum Exhibitions, some of which are mentioned on another page, nothing of special interest to horticulturists will take place during the ensuing week. Several auction sales are announced, and particulars of these can be found in the advertisement pages.

- AT the monthly meeting of the UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY held on Monday last five new members were elected. The Secretary announced that out of the 500 members not one was on the sick fund.
- THE WEATHER IN LONDON.—During the past week the weather in the metropolis has been of a changeable character. Sunday was fine, and a sharp frost occurred at night. Monday was also dry and cold, freezing during the night; but Tuesday proved a typical November day, being damp and foggy. During the evening it rained heavily, and Wednesday opened dismally. At the time of going to press it is raining slightly.
- WEATHER IN THE NORTH.-We have had a week of seasonable weather. In the beginning frosts of from 5° to 8° occurred. There was heavy hoar frost on the morning of the 9th, and slighter on that on the 13th. There has been little sunshine, and cold north-easterly winds have generally prevailed.—B. D., S. Perthshire.
- THE YORK GALA.—As announced in our advertisement pages the great Floral Fête at York next year will be held on June 13th, 14th, and 15th. A sum of £650 will be offered in prizes. Mr. Chas. W. Simmons, 13, New Street, York, is the Secretary, and schedules will be ready in January next.
- MESSRS. DOBBIE & Co., Rothesay, inform us that they have this week received a Royal Warrant appointing them seed growers and florists to the Queen. They also announce that Mr. Archibald M. Burnie, a prominent member of the Institute of Bankers in Scotland, becomes a partner in the firm, taking charge of the counting house.
- CARNATIONS FOR WINTER FLOWERING, a correspondent observes, were in splendid condition at Ketton Hall last week, and several plants of Urceolina aurea were in full bloom. Some good Orchids, including Cypripedium insigne Maulei, and bushes of Salvia Pitcheri were very attractive. On the roof of a warm house large numbers of flowers of Allamanda Hendersoni and Bougainvillea glabra were hanging. A plant of Aristolochia and a Bignonia in flower were also conspicuous.

- GARDENING APPOINTMENT.—Mr. Harry May, late of Roscmount, Sunningdale, has been appointed as head gardener to Mrs. McIntosh, Havering Park, Romford.
- PYRUS JAPONICA FRUITING.—"G. H., Gosport," writes, "I enclose a fruit of the well-known Pyrus japonica for your inspection. Is it not a very unusual thing for it to fruit? I have not heard that a fruit has ever before been seen in this part. It is growing on a south wall." [Pyrus japonica has fruited abundantly this year in many gardens.]
- POTATO PICKING IN SOUTH LINCOLNSHIRE.—At Holbeach and Long Sutton (large Potato growing districts), there has been a great demand for labour, in order to get up the tubers. The Potatoes are turning out well, and in the marshes so great is the demand for hands that the farmers are outbidding one another to obtain pickers. Boys and girls are getting as much as 2s. and 2s. 3d. per day, and labourers with large families are reaping quite a harvest. In Hertfordshire the other day we noticed there were many fields of Potatoes undug.
- Peaches and Nectarines at Ketton Hall. Mr. A. Harding, Orton Hall, writes:—"It is not only Chrysanthemums that are to be seen at Ketton Hall, for the most commanding feature is undoubtedly the Peach and Nectarine trees under glass, and Mr. Divers, the courteous and talented gardener there, has made himself famous as an exhibitor of these fruits, as the columns of the Journal has often testified. The Peach trees alone are worth a journey to see, and although the fruit is over for this season, the growths for bearing next year are splendid, and show good culture."
- A NEW CALLA.—Messrs. E. H. Krelage, Haarlem, Holland, write:—"I beg to inform you that the rose-coloured Calla, imported by our firm and mentioned in your columns (page 420), has proved to be identical with Richardia Rehmanni, which was first described by Engler in his 'Botanisehe Jahrbücher,' 1883, under the name of 'Fantedeschia Rehmanni.' We exhibited a flowering plant at the last Floral Committee meeting of the Royal Netherlands Horticultural and Botanical Society, where it was awarded a first-class certificate."
- ROYAL BOTANIC SOCIETY.—A meeting of this Society was held on Saturday last, Mr. T. H. Burroughes in the chair. On the proposition of the Duke of Teek, President, the Duke of York was nominated for the fellowship of the Society. The following also were eleeted, and the nominations of many others read for ballot at the next meeting:—Mrs. Haslam, Mr. J. Hutchinson, jun., and Mr. W. E. Whadcoat, The donations received since the last meeting included many uncommon and seldom seen fruits, both home-grown and from the continent, illustrating the special fruitfulness of the year just closing.
- —— SEVERAL METHODS OF PRESERVING APPLES THROUGH THE WINTER were discussed at a Conference in Somersetshire. The boiling of fruit and filling sulphurised casks with them was recommended, also burying Apples in pits and thatching them in, and laying them in clamps, all of which methods were said to have proved successful. One farmer has adopted the plan of drying his Apples by evaporation. It was not mentioned at the aforesaid temperance meeting, but our contemporary states that the pomace of the Apples—that is, the residue after they have been ground and the juice pressed out—is almost as good for stock as the Apples themselves, and it can be easily preserved by clamping it like Potatoes and thatching it over.
- VEGETABLE AND ROOT SHOW AT LEICESTER. Messrs Harrison & Sons have again held their annual vegetable and root Show, and, says a local contemporary, another success has been seored. The Exhibition was opened at the Market Hall on Wednesday, November 8th. Liberal prizes had been offered by the firm for the roots and vegetables grown from seed supplied by them, and, judging from the excellent quality of the exhibits, the judges must have had no easy task in awarding the prizes. A better exhibition of Celery has very rarely been seen. Some fine heads of Harrison's Leicester Red Celery and the Early Rose variety were staged. The competition was strong in the Carrots, and of the Early Market and the Selected Intermediate Carrots it would be impossible to speak too highly. There were also some good specimens of the Autumn Giant Cauliflower, but the competition was not quite so marked in this class. Savoys were very strongly represented, and some exceedingly large ones were on view. The quality of the Brussels Sprouts was very good, whilst the same remarks would apply to the Onions and Beets. Perhaps the Cheltenham Greentops were the most conspicuous in the Beet line. Messrs. Harrison usually excel in Potatoes, and the exhibits this season did not prove an exception. here were some very fine tubers on exhibit.

- FORESTS OF APPLE TREES.—According to "Meehans' Monthly," the Apple has become wild in the Sandwich Islands, and forests of trees of many aeres are found in various parts of the country. They extend from the level of the sea far up into the mountain sides. It is said that miles of these Apple forests can oceasionally be seen. One traveller gives the extent of one of them as between five and ten miles in width and about twenty miles long.
- —— GROWING FILBERTS AND HAZEL NUTS.—Inquiries are frequent in regard to the probability of profitable culture of the Hazel and Filbert Nuts. Trees growing by themselves seldom produce large creps, on account of the different periods at which the catkins mature and the bearing flower opens. In order to get them suecessful, therefore, they have to be grown in large quantities together. Of all trees Filberts are the most gregarious. When numbers are planted in an orchard by themselves they bear remarkably well. The best situation is one exposed to the north, as the southern exposures might induce a still greater period between the openings of the two classes of flowers.—("Mechans' Monthly.")
- BRITISH FUNGUS FLORA.—Some three months ago we published a notice of two volumes of Mr. George Massee's "British Fungus Flora." The third volume of the series has now come to hand, and within we perceive an intimation that in order to complete the subject the issue of a supplementary volume is contemplated. The present volume is even more comprehensive than those which preceded it, and presents the same excellent appearance in respect of binding and typography. The Basiomycetes occupy more than half the book, and the remaining two hundred pages comprises the Hyphomycetes and other funguses. The exhaustive and analytical character of the work is well preserved, and those who are interested in this recondite subject will find many of the old obscurities and uncertainties peculiar to fungology cleared away.
- Pentstemon anterrhinoides.—Mr. W. Watson of Kew, in referring to this plant in a recent issue of the "Garden and Forest," says:—"This interesting shrubby species of Pentstemon was introduced to Kew from California about twenty years ago, and flowered in the open ground in September. It is not, however, hardy, and eonsequently it had disappeared from cultivation here until it was shown in flower at the Royal Horticultural Society meeting recently by Sir Trevor Lawrence. It is a much-branched, glabrous, subcinerous shrub with slender leafy shoots, suggesting those of Myrtle or Leptospermum, and bearing numerous lemon-yellow flowers an inch across, short in the tube, with the lower divisions of the limb incurved. It might prove a good plant to cross with the popular herbaceous species of the genus."
- How Plants Sicken and Die was the subject of an exceedingly interesting and most instructive lecture delivered before the members of the Paxton Society at their rooms at the Saw Hotel last weck by Mr. H. Crowther, F.R.M.S., Curator of the Philosophical Hall, Leeds, and late of Truro, Cornwall. Mr. W. Tunnicliffe presided, and Mr. G. Gill occupied the vice chair. The lecture was illustrated by a large number of very beautiful photographs, and shown by means of the lime-light. The lecturer dealt with his subject in a very masterly manner, and his remarks were most attentively listened to. He showed in the first place the great similarity in many respects between human beings and plants and trees, and after clearly demonstrating the form of the various parts, and the work they carry on, he explained how plants are attacked and destroyed by various insects and also by means of foul gases.
- FLORA OF NEW ZEALAND.-Mr. George Thomson of Dunedin calls attention to some suggestive facts about the flora of New Zealand. As everyone knows, New Zealand when discovered did not possess any mammals, with the doubtful exception of a species of rat. Accordingly, we find that those plants, which have defensive structures such as spines, prickles, and those whose seeds or fruits are fitted for adhering to the coats of passing animals, and thus obtaining dissemination, belong in almost every instance to species having a wide range outside of the islands. The inference, therefore, is that the characters referred to have been developed outside the New Zealand region, and that such species have been introduced into that country at a comparatively recent period. The general absence of conspicuous flowers is attributed to the corresponding absence of insects necessary for their fertilisation. Previous to the arrival of European bees the Clover did not set seeds, and if the native birds mentioned are destroyed a similar fate may befall the plants to which they are co-related.

THE APPLE CROP in the cider districts of the west is exceedingly abundant this year. The orchards of Herefordshire, says a daily contemporary, have been heavily laden with fruit, and in Somersetshire cider Apples are so plentiful that the farmers in many cases are giving them to stock instead of grinding them for eider. The Mid-Somerset Temperance Village Mission, objecting to cider, held a conference lately, in which speeches were delivered and letters read showing the value of Apples for stock, and discouraging the manufacture of cider. A gentleman writes: "Our worst Apples are given to the cows, who are more eager for them than for meal or cake." A lady made the following statement: "We give our Apples to the cows every day, about 12 lbs. to each cow, and find it increases the butter and improves the condition of the cows. The very small Apples we shall boil for the pigs." She declared that Apples suit young pigs better than any roots that can be mentioned. One informant states that Apples at 28s. a ton—the present price-were much cheaper as food for milch cows and other kinds of stock than Mangels at 12s. a ton.

- GIRDLING BRANCHES TO PROMOTE FRUITFULNESS.—It has long been known that if a ring of bark be taken from a branch it will cause that branch to prematurely bear fruit. But that branch usually dies soon. The ring may not be taken completely around, that is to say, a connection between the bark above the ringed portion and below the ringed portion remains. In this case, the part above the girdled portion does not die, but is brought into fruitfulness, which continues for several years. This, says "Meehan's Monthly,' has only been employed as a matter of curiosity, as it is usually considered that the quality of the fruit is impaired by this procedure. Certainly in Grapes, the fruit produced after girdling is not nearly as sweet or in any way as much appreciated, with the single exception of size, as in cases where the girdling process has not been attempted; but in the Orange culture in Florida, it is stated that this girdling is becoming a part of general practice, and perhaps this may account for the enormously large increase of sour instead of sweet Oranges, which is being poured into markets from that State.

- IMPROVEMENT OF THE CARNATION.—For many years when Carnations were grown simply for their beauty as cut flowers, little attention was given to any other point except to their fragrance, tints and colour, or size of bloom. When they were cut for florists' purposes, artificial stems had to be given to each flower. This made it very troublesome to florists, and besides prevented the general use of the Carnation in boutonières, because for want of stems there was no opportunity to put articles retaining moisture around the stalks by which withering could be prevented; they were soon, therefore, useless. American florists, however, have turned their attention to developing Carnations which produce flowers singly on long stems, and yet will stool up so as to give bushy, stocky plants, producing these long-stalked flowers in the greatest abundance. So successful has the improvement of the Carnation been in this way, that no one ever thinks now of buying Carnations except with stalks often 5 or 6 inches in length. It is interesting to note that this particular kind of improvement does not seem to have been appreciated by improvers in the Old World, as the popular Carnation for florists' work is still one which was raised in France nearly twenty years ago, known as Souvenir de la Malmaison. This produces one enormous flower, oftentimes $1\frac{1}{2}$ inch in diameter at the top of the stalk, with numerous short-stalked buds along the main stem. No florist here could make his salt out of the cultivation of such a Carnation. Little instances, says "Meehans' Monthly," like these show the immense advance made by American florists in certain lines of improvement over the progress which the same thing has made in the Old World.

PRIZES AT THE GARDENING AND FORESTRY EXHIBITION.

I was pleased to see this matter noticed on page 419 of the Journal of Horticulture. I fear that "Exhibitor" will require a considerable amount of patience before he can get those in authority at Earl's Court to do what is just and what should have been done long ago. They not only refuse to pay, but add insult to injury by refusing to answer letters respecting payment of prizes; and when, after much pressure, a reply is obtained it is evasive, prolonging the exhibitor's agony, and adding to expenses. I was heartily glad to see "Exhibitor's" letter, and I trust that its publication and these notes will assist those who have given much time at considerable cost in endeavouring to make the exhibitions attractive and won the prizes that were offered.

I would suggest that the exhibitors meet together as soon as possible and subscribe to take a test case into Court, and compel payment of the prize money. This will be an easy matter for a number, whereas one person could ill afford it. I will gladly contribute my share towards

the object in view, and in future I would beg those interested in horticulture to give Earl's Court exhibitions a wide berth. Though we were misled by the respected names of Messrs. Milner and Turner as managing this section, we shall in future know that the syndicate are unworthy of support. Last year they failed to give the charities connected with horticulture the donation promised with such a loud flourish of trumpets, and undoubtedly that promise led gardeners and others to exhibit the more cheerfully, in the assurance that institutions established for the support of the aged and orphans would be in some measure assisted.

If any exhibitors have been paid the prize money to which they are justly entitled, it would be well if they would state the fact. I know several gardeners who have received no prize money after spending, to them, considerable amounts in the necessary expenses connected with exhibiting.—Another Exhibitor.

CHRYSANTHEMUM SHOWS.

THE following Chrysanthemum shows, which have been advertised in our columns, remain to be held during the current month:—

Nov. 16th, 17th, and 18th.—Edinburgh, York.

" 17th and 18th.—Bolton, Sheffield. " 24th and 25th.—Eccles and Patricroft.

REPORTS OF CHRYSANTHEMUM SHOWS.

WE are very much obliged to our friends who favour with reports of Chrysanthemum shows in the provinces, but those which come to hand so late that they cannot be published till a fortnight after date have perforce to be put aside for more recent matter.

EXHIBITORS' CARDS.

WILL you kindly allow me space in your valuable paper to make a suggestion now the Chrysanthemum exhibitions are prevalent? I think it would be better both for judges and exhibitors alike if the cards with names and addresses on were not placed till after the judging, but each exhibitor could have a private mark to avoid any mistake. It would, I think, save the judges from being accused of partiality in any points, and would also satisfy exhibitors as to the justice of the awards.—OBSERVER.

NATIONAL CHRYSANTHEMUM SOCIETY.

A MEETING of the General Committee of the National Chrysanthemum Society will be held on Monday evening, November 20th, at Anderton's Hotel, Fleet Street, E.C., and at the termination of the regular business Mr. Charles E. Shea, The Elms, Foots Cray, Kent, will read a paper on "Judging Chrysanthemums." The annual dinner will take place at the same place on Thursday, November 30th, when the President, Sir Edwin Saunders, will occupy the chair.

THE N.C.S. AND ITS CERTIFICATES.

I AM glad to see the Floral Committee are exercising a tight hand in respect to the awarding of certificates. The standard of merit is now a high one, and unless a variety is really good and distinct it is passed over. This is how it should be, and the certificates will be much more valuable. I cannot help thinking the Floral Committee should adjudicate on the blooms in a place where something like fair daylight can be obtained. I believe one or two really good varieties were passed over because the light was insufficient to distinguish the colours.

Whilst writing of certificates, I think it would be a good plan to follow out the system adopted by the R.H.S.—viz., that the names of the members of the Floral Committee present be published, and also that the list of varieties certificated should be published in the schedule or report, with the date of the award and the number of votes each variety obtained.—A Mummer.

A FRACAS AT THE AQUARIUM SHOW.

At the recent Exhibition of the National Chrysanthemum Society I, with some scores of other persons, witnessed a most unseemly and unpleasant scene. It appears two Fellows of the N.C.S.—aye, and members of its Floral Committee—were in competition in a certain class. A wins first, B second. The award upset B considerably. He shouted and made a great disturbance—not for a short time, but for hours, ultimately tearing his prize card in pieces. It was certainly a very bad example for any exhibitor to make, especially one in the position of B. If every man who thought he was going to get the prize and did not get it acted in such a manner, what melées our exhibitions would be!

I never heard anyone complain of the awards but this particular member, and for his sake I think it would be well for the Society to adopt the rule in existence among provincial Societies—viz., "Any person finding fault with the decision of the Judges in any other way than by a written protest, or otherwise creating a disturbance in the place of exhibition, shall forfeit the amount of his prizes for the day."

—A. B. C.

CHRYSANTHEMUM MDLLE. THÉRÈSE REY.

THE above mentioned Chrysanthemum is unquestionably one of the finest novelties of the year. It is a magnificent Japanese variety of continental origin, being raised by Mr. Ernest Calvat. The flower is large, with long, drooping, broad creamy white florets. Already two certificates have been awarded for this splendid variety, one to Mr. H. Shoesmith by the National Chrysanthemum Society on October 11th, and another to Mr. C. E. Shea at the Crystal Palace Show on November 3rd and 4th. The illustration (fig. 65), which indicates the character of the flower, has been prepared from a bloom grown and exhibited by Mr. Shoesmith at the Crystal Palace on the occasion mentioned.

JUDGES AND JUDGING.

BEING an exhibitor in the Japanese class at the recent Chrysanthemum Show at the Royal Aquarium I had the opportunity of seeing the judges deciding on the merits of the blooms, and venture to express my opinion that sufficient time was not given to the work to enable absolutely correct awards to be made. I think every bloom should be taken independently and allowed the number of points to which it may be entitled. Neither do I think that a judge should be an exhibitor at the same show, nor do I think it quite right for a man in business to judge his customer's exhibits.—AN EXHIBITOR.

A LARGE VIVIAND MOREL.

In answer to "F. J., Olton" (page 422), regarding a large Viviand Morel, I may mention that at Leeds Chrysanthemum Show last year a bloom of the above variety was exhibited by Mr. Hayes of Woodville, Keighley, which measured 20 inches over, which was deservedly awarded a certificate for cultural skill.—T. H. B.

WHITE VIVIAND MOREL.

YOUR note on page 422 referring to the white Viviand Morel, shown by Mr. Shoesmith at Crystal Palace, will I am afraid be misleading. The class in which it was shown required twenty-four Japanese and twenty-four incurved, in not less than eighteen varieties of each and not more than two of one variety. As Mr. Shoesmith had only one pink Viviand Morel in his stand he evidently did not intend it to be recognised as distinct, and I feel sure that until a true white sport has been certificated by the N.C.S. it will not be wise to exhibit it as a distinct variety on the same stand with a pink one.-W. H. LEES, Trent Park Gardens, New Barnet.

[Whether Mr. Shoesmith intended the pure white sport from Viviand Morel to be recognised as distinct or not, it was all the same absolutely distinct from the type—quite as distinct as Mrs. Heale from Princess of Wales, and blooms of both these varieties have often been cut from the same plant. Since the publication of our note the Secretary of the National Chrysanthemum Society has been consulted on the point in its bearing on the Hull Show, and his view is this. "If a bloom of Mrs. W. R. Wells is pure white it can be staged with the deep pink Viviand Morel without risk of disqualification, but it must be free from the pink tinge." The other Judges appointed to officiate at Hull, Messrs. G. Gordon and J. Wright, concur, as do both Mr. J. Douglas and Mr. J. Laing, both of whom have been specially consulted, but not one of these gentlemen would vote a certificate for the white sport because of its instability. Mr. James Hudson, who judges at Hull in the unavoidable absence of Mr. Wright, is in complete accord with the opinions expressed. Intending exhibitors at shows generally must decide for themselves whether it will be wise in each particular case to stage the white sport and its pink prototype in the same stand, and we shall be quite content for them to be on the safe side, as suggested by the accomplished grower and successful exhibitor Mr. W. H. Lees.]

EXPERIMENTS IN CHRYSANTHEMUM CULTURE.

AT the meeting of the National Amateur Gardeners' Association held in the Memorial Hall, Farringdon Street, E.C., last week, Mr. D. B. Crane of Highgate read an excellent paper on the above subject. There were considerably more than 100 members present, and the crowded audience listened most attentively to the discourse. As an authority on Chrysanthemums and a winner of many prizes in open competition, Mr. Crane, although an amateur, dealt with the matter in a thoroughly practical manner. During the past season he had, it was remarked, made many experiments, but owing to the abnormal season the majority of them had proved valueless. The essayist strongly urged his hearers to grow the best varieties only, and where space was limited it would, he said, be better to cultivate half the number of plants that could otherwise be had. Many beginners made the mistake in endeavouring to grow too many plants. In such cases the Chrysanthemums were crowded, and the results were not of a satisfactory nature.

Cultural details were described at length, and amongst other hints Mr. Crane remarked that whilst some growers advised the cuttings, after insertion, to be placed in a cold frame, he had found it advantageous to place the pots containing them in a small frame in a greenhouse. The pots were, in his case, plunged in cocoa-nut fibre refuse, which to a great extent prevented damping. Oyster shells he could recommend as drainage, and whilst some half-inch bones used by him this year had answered admirably for the purpose, others, through not having been properly prepared, became putrefied and killed several

plants of choice varieties. It is impossible in this brief reference to mention all the useful hints put forth by Mr. Crane in his paper, but it may be said that, after remarking on soils, manures, and repotting, he detailed the methods of securing the buds, dressing the blooms, staging them for exhibition, and various other essential points in a masterly manner.

CHRYSANTHEMUM CHARLES DAVIS.

I SHALL be glad to learn which tint of colour is considered the correct one for this variety. It was introduced as a rosy bronze, but when it was certificated, two blooms, perfect in shape, fresh, and of a rich bronze, were passed over for two of the same size but pale yellow with a darker edge. At the late meeting of the National Chrysanthemum Society the various exhibitors vied with each other as to who had the darkest blooms. In its parent Viviand Morel, a blush or pale bloom would not count as much as one of a deeper tint, and the same system prevails in judging Etoile de Lyon and many others. If such be the case, will anyone say which is correct for Chas. Davis? If richness of colour is required, why did the certificate go to blooms of a most undecided yellow?—QUERIST.

NOVELTIES AT THE AQUARIUM SHOW.

WITHOUT taking into account such recent introductions of high merit as Colonel W. B. Smith, W. Tricker, William Seward, Charles Davis, G. W. Childs, Beauty of Exmouth, Gloire du Rocher, Lord Brooke, Florence Davis, and others of the past season or two, all of which were very well represented at the Aquarium Show last week, there was a large number of novelties presented for public inspection at the Floral Committee, and also in one or two of the trade stands. As some of these are likely to occupy a prominent position in a short time to come it may be useful to record the names, and give a brief description of some of the best.

In addition to those which received first-class certificates, and described below, a few others merit notice—namely, Mrs. Cox, a crimson sport from M. Bernard, closely resembling its parent in form, seemed to be a promising variety for those who care for that type of Japanese flower. Ernest Caille, a seedling Anemone, raised by Simon Délaux, colour rosy straw with yellow disc, will be sure to become a favourite in that section. Sautel 1893 is a bold Japanese incurved hairy variety, a valuable addition to the ostrich plume class, the colour is rosy purple with silver pink reverse. Lady Saunders is a Japanese variety with long drooping florets, and of a peculiarly pleasing shade of pale yellow. W. Mease is a large incurved Japanese, of a type somewhat resembling Mrs. C. Harman Payne.

Bride of Maidenhead unfortunately too closely approaches Avalanche, or it would unquestionably become a leading exhibition flower, the colour seemed to be a shade or two whiter than the variety it resembles. Hibernia, a large Anemone of an ochre yellow shade with a rosy buff disk, and Caledonia a large Japanese Anemone with long white incurving guard florets, and a rosy disk tipped yellow, will both be welcome additions to the Anemone section in which so few additions of merit seem to be made. Pearl of Maidenhead is an enormous tubulated curly petalled Japanese, rather ragged, colour white, and as shown by Mr. Owen, seemed almost to require a board to itself. W. H. Fowler is a perfectly formed Japanese, a most effective flower with long petals of a deep rich golden yellow. A heavy built massive flower is Thomas Hewitt, the colour is white but the outer florets are shaded blush. E. L. Jamieson is a fine colour, the petals are rather short, but they are of a bright crimson hue, having a bronzy gold reverse. Gettysburgh is another of the G. W. Child's stamp, but rather darker in colour. A thorough Japanesc is James Myers with thin fluted delicate petals of deep rosy salmon. There is no doubt that some of the above will be favourably received next season although passed over now.

CERTIFICATED CHRYSANTHEMUMS.

The following new Chrysanthemums were awarded first-class certificates by the Floral Committee of the National Chrysanthemum Society at their meeting on November 8th.

Golden Wedding (Mr. Godfrey).—A fine golden yellow Japanese with rather thin incurved florets.

Elsie Neville (Mr. W. Seward).—A single flowered Japanese with long crimson florets of a pleasing and effective shade.

Mrs. C. J. Salter (Mr. W. Wells).—A golden buff-coloured self Aneone of medium size.

G. W Childs (Mr. H. J. Jones).—A bright chestnut crimson Japanese with golden reverse, rather broad pointed petals.

Colonet Chase (Mr. E. Beckett).—Long fluted drooping florets; a large Japanese show bloom; colour pale blush with centre shaded yellow.

Rose Wynne (Mr. R. Owen).—This is a heavily built Japanese incurved with long florets of a delicate pale blush colour.

W. W. Astor (Mr. R. Owen).—A large Japanese Anemone with ray florets light salmon blush, and a high disk of golden rose.

John Bunyan (Mr. R. Owen).—Another excellent Japanese Anemone of light lemon yellow, good disk and thin pointed ray florets.

Several other good varieties were staged which the Committee desired to see again. Mr. Calvat sent over some new seedlings which were hardly up to his usual standard. Messrs. Cannell, Mr. Jones, Mr. Owen, Mr. Godfrey, and Mr. W. Seward were the principal exhibitors on this occasion. Among noteworthy flowers mention should be made of Miss Sturgis, a large white Japanese; Pcarl Beauty, a fine white incurved Japanese; and Florence Carr, a pretty orange bronze Pompon (commended).—C. H. P.

CHRYSANTHEMUMS AT WOODVILLE, KEIGHLEY.

ONE of the best grown collections of Chrysanthemums in this neighbourhood is to be found at Woodville, the residence of C. A. Haggas, Esq., where his gardener, Mr. Hayes (raiser of the now well known incurved variety, Miss M. A. Haggas) grows about 200 plants of the leading varieties for the production of large blooms. Amongst Japanese the following are especially fine:—W. Tricker, Sunflower, Bouquet des Dames, Louis Boehmer, Mdlle. Marie Hoste, Lord Brooke, R. C. Kingston, Colonel W. B. Smith, Viviand Morel, and Edwin Lonsdale. Mr. Hayes speaks highly of an improved W. H. Lincoln as a promising variety, and quite distinct from the original type.

A fair proportion of incurved are also grown, his best being Alfred Lynne, Golden Empress, Mons. R. Bahwant, Miss M. A. Haggas, Queen of England, and Lord Wolseley. In another house a number of bush plants are grown for cut blooms. Mr. Hayes is also a successful cultivator of the Primula. His papers and lectures given at the different gardening associations in the district are much appreciated.—T. H. B.

CHRYSANTHEMUMS AT KETTON HALL.

By the kind permission of Mr. and Mrs. Hopwood the gardens and greenhouses of Ketton Hall were thrown open to the public on November the 2nd and 9th, and will be opened again on November 16th. The gate is opened at two o'clock and closed at five. Sixpence is charged for admission, and the proceeds are to be devoted to the Royal Gardeners' Orphanage Fund. The chief attraction at the present time are the Chrysanthemums, of which many hundreds are grown and tastefully arranged in the Peach houses.

With a friend I paid a visit to Ketton Hall on November 9th, arriving soon after the gates were open. We soon found the Chrysanthemums, and a fine display they made, a large number of the blooms being of good quality and size. Most noticeable amongst them were Col. W. B. Smith, Florence Davies, Mdlle. Lacroix, Avalanche, Gloire de Rocher, Etoile de Lyon, Thunberg, Mr. A. H. Neve, W. H. Lincoln, Lord Wolseley, Lilian B. Bird, Louis Boehmer, Viviand Morel, W. W. Coles, Mrs. E. W. Clarke, Mrs. Robinson King, Comte de Germiny, and older

I also noticed some useful plants in 6-inch pots, several cuttings having been put in each pot the end of August, rooted, and allowed to remain there. These are now bushy, and about 1 foot in height, carrying plenty of flowers. About 500 more plants in 9-inch pots of such varieties as Fair Maid of Guernsey, Madame C. Audiguier, and Peter the Great looked very promising for a fine display throughout December and onwards. There are many other good features at Ketton Hall, but only Chrysanthemums can be mentioned here.—A. HARDING, Orton Hall.

AT WOODHATCH LODGE.

This, the residence of T. B. Haywood, Esq., has become known as a place where horticulture is thoroughly carried out. Everything is done well and cleanliness prevails. Not by any means the most insignificant feature of the gardens are the Chrysanthemums, in which, as, in fact, in all horticultural matters, Mr. Haywood takes such an interest, and supported as he is by the gardener, Mr. C. J. Salter, the display is a magnificent one. Though at the time of my visit the blooms were on the wane, probably the very best of them had gone, but those remaining were ample proof of the skill with which they had been grown. The Japanese section, taken as a whole, was perhaps the richest in fine flowers, both as regards form and colour, though the incurved varieties were handsomely represented. The Anemone flowered kinds, too, were in fine form, many superb flowers being still on the plants. The collection is one of the most complete that could be desired, all the novelties of last season being grown, as well as others not yet in commerce. Though the new kinds are procured the older ones are by no means discarded, every one of real merit being grown.

From amongst the best of those still in flower, I have selected a few of those which were possessed of exceptional merit either in form, substance, or colouration. Than Lord Brooke it would be difficult to find a better with which to open any list, for the flowers seen were magnificent. The colour was of the greatest richness, and the flowers massive and shapely. Wm. Seward was grand, being particularly fine in colour. The same may be said of the brightly hued W. H. Lincoln, than which there is yet no yellow superior in its own particular style of One of the most chaste and beautiful was Miss Anna Hartshorn, which has been seen in such good character this season. Mdlle. Marie Hoste is represented by some of the grandest flowers one could wish to see, as also was the popular Col. W. B. Smith. Of the pinks Vice-President Audiguier, Mrs. Harman Payne, and Wm. Tricker form a grand trio. The flowers of each of these are perfect as regards colouring, and Mrs. Harman Payne carried blooms which were of an enormous size and substance. Many blooms of the grand Edwin Molyneux were to be seen amongst the others, as also were neveral Chas. Davis of a high order of merit as regards colour and form of flower. Elmer D. Smith is a velvety, maroon coloured, ragged bloom which promises to be an acquisition, as also does the exquisite Viscountess Hambledon. Excelsior was one of the most distinct, and Robert Flowerday, purplish maroon with a silvery reverse, one of the most pleasing. Beauty of Exmouth was of grand shape but lacking size and substance; the green centred Florence Davis on the other hand left nothing to be desired. Ruche Toulouaise amongst the Anemones was magnificent, as also were Mrs. A. Lowe, Lady Margeret, and Delaware. Many others might be mentioned, but these must now suffice. Both Mr. Haywood and his gardener are to be congratulated on the success they have achieved in bringing

plants and flowers to such a high state of perfection, and this through a season that has been most trying for Chrysanthemum growers in more ways than one.—H.

AT SYON HOUSE.

CHRYSANTHEMUMS, amongst innumerable other things, are splendidly grown by Mr. G. Wythes at these gardens. Upwards of 1500 plants are included in the collection, which comprises many of the new varieties of the last season. The object has not been entirely to obtain large flowers, many of the plants being kept exclusively for affording an abundance of cut flowers. The plants are dwarf in habit and clothed with healthy foliage.

Amongst the varieties now in flower, Excelsior must be accorded a foremost place, its distinct blooms being very striking. Lady Selborne is admirably represented as also is Jeanne d'Arc. W. W. Coles is in magnificent form, and the same may safely be said of Mr. C. Orchard. The flowers of Viviand Morel are of exceptional substance and grandly coloured. The bright yellow flowers of Sunflower are amongst the most showy, and Puritan is one of the very finest in every way. The blooms of Stanstead Surprise are superb, the same remark applying to Baron Hirsch. Alberic Lunden is a very beautiful variety, which may be seen in almost all collections. Well named is Curiosity, pale yellow in colour. Lord Alcester is fine, and Baronne de Prailly is one which should be more grown. Monsieur William Holmes is carrying superb flowers, and makes one of the brightest ornaments of the display. Mr. A. H. Neve, Sarah Owen, William Tricker, Lady Margaret, Lord Brooke, Miss M. Wheeler, Roseum superbum and Grandiflorum were noticeable amongst others, of which many excellent ones must be missed. The plants are a credit to Mr. Wythes, as everyone who sees them will readily admit.—NOMAD.

THE GRANGE, HACKBRIDGE.

THE display of Chrysanthemums at these gardens has come to be an annual event, and through the goodness of Mr. and Mrs. Smee the grounds are thrown open to the public, who come in great numbers to see the flowers. When at Hackbridge I asked Mr. Cummins, the genial gardener, if he could say how many people had visited the gardens. He replied, "I cannot tell, but all the afternoon on Sunday last the usually quiet road from Hackbridge to Wallington was lined with people. The carriage drive and garden walks were crowded, and the large orchard house, where the Chrysanthemums are arranged, was packed all the time." The Cattleya house, containing some fine forms of the beautiful autumn-flowering C. labiata, and the Fern house were admired by many. That Mr. Smee's kindness in providing a free annual Show is appreciated by the inbabitants of Wallington and the neighbourhood is proved by the thousands of people who have passed through the lodge gates.

Among the most prominent varieties of Chrysanthemums Mr.

Among the most prominent varieties of Chrysanthemums Mr. A. H. Neve is in grand style, and the deliciously scented Progne is one of the most popular and attractive. The handsome examples of Viviand Morel call for continuous bursts of admiration. Mons. R. Bahuant is splendid, as also is Sunflower, the colour of which is unusually bright. The showy and floriferous Roi des Précoeés is deservedly a favourite, and the chastely pure flowers of Lady Selborne leave nothing to be desired. Amongst the darks Edouard Audiguier is perhaps the best, though it has a worthy companion in R. C. Kingston. The hairy-petalled W. A. Manda and Louis Boehmer are both particularly prominent, and Gloriosum may be regarded as a variety of very much merit.

AT EARLSWOOD.

DURING the past few years Mr. Wells of the Earlswood Nurseries has come very prominently before the public as a grower and exhibitor of Chrysanthemums, and late though it was I thought when the opportunity arose that I could not do better than to spend an hour amongst his plants. I was amply compensated, for the collection is certainly a good one. Upwards of 3500 plants are grown, and they now show the mark of unremitting and skilful attention. All these plants are not grown for large blooms exclusively, many being required to furnish cut flowers in great numbers. Perhaps a thousand plants are grown for providing exhibition flowers, the remainder being for the purpose above mentioned. Innumerable single and seedling varieties are grown, and amongst the latter were some of great promise. As may very readily be imagined, with such an extensive exhibitor as Mr. Wells, most of the finest flowers had long been gathered, but amongst those remaining were many of such sterling merit that we have deemed them worthy of special mention.

Mrs. E. D. Adams, with slightly tinged florets, was one of the most charming, and the old Peter the Great was in splendid form. Beauty of Hull is too much after the style of Mr. Shoesmith to become universally popular, though it carries some good and shapely blooms. Mrs. Governor Fife is a most pleasing variety, the outer petals of which are pure white, with a centre of the most delicate cream. Ada Spaulding and Sunflower were both seen in fine condition, as also was the Baronne de Prailly. The white blooms of Mons. J. M. Pigny were very beautiful, as also were those of Florence Davis. A charming creamy white variety was found in Cognac, and Lord Alcester was of exceptional form. Mrs. G. W. Clarke was grand, as also was Vice-President Audiguier. The colour of Viviand Morel was magnificent, and the blooms left little to be desired as regards shape. Stanstead White may be numbered amongst the purest of whites, and Crimson King one of the best of its class. J. Stanborough Dibben, Lord Alcester, Empress, and numerous others might be mentioned, but these may be taken as a criterion of a collection which represented by some of the best flowers one could wish, to see.—R. H. R.

CHRYSANTHEMUM SHOWS.

HULL AND EAST RIDING .- NOVEMBER 15TH AND 16TH.

THE tenth annual Exhibition of the Hull and East Riding Chrysanthemum Society opened yesterday (Wednesday) in the Artillery Barracks, Park Street, Hull. The Hull Shows are famed for their magnitude and excellence. As was generally anticipated the liberal prizes, including a challenge vase worth 20 guineas, several silver cups, and pieces of plate of considerable value, brought forth many of the principal growers. Our reporter telegraphs the names of the prizewinners in the leading open classes, and says the high reputation the Society has long enjoyed is fully maintained. In most of the classes the entries were numerous, and the competition was keen. The tables of bouquets and floral decorations were not quite so numerous as usual, but good; while the groups of plants were magnificent. Incurved blooms were some of the best seen this season, and the Japanese superb, being large and well coloured.

In the class for twenty-four incurved blooms, in not less than eighteen varieties, and no more than two blooms of one variety, Mr. W. Lees, The Gardens, Trent Park, New Barnet, secured the coveted first prize of £10 and a silver cup valued 5 guineas. His blooms were grand, being splendidly finished. Mr. H. Shoesmith, gardener to M. His blooms were Hodgson, Esq., Shirley, Croydon, was a close second, winning the £5 prize; and Mr. Peter Blair, Trentham, third.

For twenty-four Japanese blooms, distinct varieties, Mr. Shoesmith secured the premier award of £10 and a silver cup valued 5 guineas with a stand of excellent blooms. Mr. Heany, the Gardens, Mossley House, Liverpool, was second; and Mr. Musk, Haveringland Hall, Norwich, gained a third position. In the class for twenty-four blooms, Japanese, distinct, arranged for effect, and set up in any manner the exhibitor desires, with or without Chrysanthemums or other foliage, on a table space not exceeding 6 feet in length by 2 feet 6 inches in width, the competition was good. The object of this class is to introduce a more tasteful system of staging highly developed flowers. Mr. Musk here repeated his success with a charming arrangement, securing the 5-guinea prize, given by Harold J. Reckitt, Esq., J.P., M.P., Winestead Hall. Mr. Wilson, Swanland Manor, was second; and Mr. Jarvis, Ciffe House Gardens, Hessle, third.

The class for a table of bouquets, wreaths, sprays, buttonholes, or other floral arrangements, illustrating the decorative value of Chrysanthemums, with any kind of foliage or Grasses, was interesting. Each exhibitor was restricted to a table space of 12 feet by 3 feet, but less space could have been occupied if desired. Mr. Taylor, Newland, was first, gaining the National Chrysanthemum Society's silver medal and

3 guineas, with a beautiful arrangement.

In the class for twelve incurved blooms, open to exhibitors residing in Lincolnshire, within twenty miles of Hull or anywhere within the East Riding of Yorkshire, Mr. Burrows, gardener, Westlands, Grimsby, was first, winning the silver cup given by Messrs. E. P. Dixon & Sons, Queen Street, Hull. His blooms were very fine. Mr. Jarvis was second, and Mr. Pike, Warter Priory Gardens, third. Mr. Burrows also secured another silver cup given by the same firm for twelve Japanese blooms; Mr. Walker, Hotham Hall, being second, and Mr. Richard Willey, Cottingham Gardens, third.

As already mentioned the groups were exceedingly fine. For a group of Chrysanthemums, interspersed with foliage plants, arranged for effect in a space of 100 square feet, the first prize being a silver challenge cup, value 20 guineas, presented by James Reckitt, Esq., of Swanland Manor, Vice-President of the Society, and £6, on the condition that the winner hold the cup until the next Exhibition, Mr. Coates, gardener, Milton Terrace, Hull, was first with a beautiful group. Mr. Cottam, Cottingham, was second, and Mr. Marchison

Hessle, third.

The other features of this grand Exhibition will be detailed in our next issue.

GRIMSBY AND DISTRICT .- NOVEMBER 3RD AND 4TH.

THE fourth annual Show was held in the Town Hall on the dates given, and it was without doubt the best exhibition ever seen in Grimsby. The large hall was filled with groups of Chrysanthemums, choice foliage and flowering plants. The orchestra was beautifully decorated with flowers and foliage plants from the nurseries of Mr. Jno. Clark, Cromwell Road, Grimsby. Adjoining the large room was another of rather less dimensions, filled with cut flowers and fruit.

In the class for twenty-four blooms Japanese, in not less than eighteen varieties, the first prize went to the Rev. W. D. Thatcher, Clent Hall, Stourbridge, who had good flowers. The second prize was secured by Sir Hy. Bennett, Westlands, Grimsby (gardener, G. B. Burrows), who only lost by two points. Mr. G. A. Carr, Waltham Grove, Grimsby (gardener, Jno. Walker), was third with neat blooms.

In the class for twelve Japanese, nine varieties, the first prize went to Mr. G. B. Burrows for excellent blooms in good condition. For twelve blooms Japanese in six varieties Mr. S. J. Grange, The Cedars, Laceby

(gardener, Mr. Fred. Isle), was first.

For twenty-four incurved blooms G. A. Carr, Esq., Waltham Grove (gardener, Mr. Jno. Walker), was a good first. Second, Rev. W. D. Thatcher, Clent Hall, Stourbridge; third, Sir Hy. Bennett, Westlands. With twelve incurved or nine varieties, Mr. John Clark, nurseryman, Cromwell Road, was first; G. A. Carr, Waltham Grove, second. Sir H. Bennet gained the special prize for the premier Japanese, and the Rev. W. D. Thatcher for the best incurved bloom.

LIVERPOOL.—NOVEMBER 7TH AND STH.

THE fourteenth autumn Show was held in St. George's Hall on the above dates, and compared favourably with those of former years. The centre of attraction was the splendid challenge vase presented by Messrs. R. P. Ker & Sons, Aigburth Nursery, and which was won last year by Mr. Jellicoe, gardener to F. H. Gossage, Esq., Camp IIill, Woolton, he being required to win it two years in succession to become the owner of the vase. This has been done, the Association being the poorer by the loss of such a fine trophy, and Mr. Jellicoe the richer by winning it in such a short space of time. The following is the prize list, regret being expressed that only the larger classes can be dealt with owing to

For twenty-four incurved and twenty-four Japanese, not less than thirty-six varieties, Mr. Donald Forbes, gardener to Alfred Holt, Esq, Crofton, Aigburth, was placed first with a very heavy stand containing in the back row—Japanese: Col. W. B. Smith, Etoile de Lyon, E. Molyneux, Col. Smith, Stanstead White, Mrs. E. W. Clarke, Florence Davis, and a grand Mrs. C. H. Payne. Second row: Mrs. E. D. Adams, Mrs. F. Jameson, W. H. Lincoln, W. Tricker, G. C. Schwabe, E. Molyneux, Viviand Morel, and Sunflower. Front row: Viviand Morel, Sunflower, Violet Rose, Marie Hoste, Mr. C. H. Payne, Avalanche, Chas. Davis, and W. Tricker. The incurved, although rather early, were marked by well built substantial blooms, the best being Queen of England, Mons. R. Bahuant, John Doughty, John Lambert, and Baron Hirsch. A very good second was Mr. T. Carling, gardener to Mrs. Cope, Dove Park, Woolton, who had some fine blooms, the best being Mrs. C. H. Payne, Viviand Morel, Princess May, Wm. Seward, Puritan, W. H. Lincoln, and Marie Hoste. Incurved: Baron Hirsch, Mons. R. Bahuant, Madame Darrier, Alfd. Lyne, Lady Dorothy (grand), and Lucy Kendall. Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton House, Allerton, was a close third with very fresh blooms. The fourth position was occupied by Mr. Sydney Bremmell, gardener to W. H. France Hayhurst, Esq., Overly, Wellington, Salop. This exhibitor would probably have been placed higher had his flowers been set up properly, for his Japanese were the heaviest and brightest coloured in the Show.

As before remarked the Ker's challenge vase was won by Mr. Jellicoe, there being four entries for it, and the competition was keen. Mr. there being four entries for it, and the competition was keen. Mr. Jellicoe won by the superiority of his incurved blooms alone. The varieties were—Japanese: Col. W. B. Smith, Mrs. C. H. Payne, Gloire du Rocher, Mdlle. Marie Hoste, Princess May, Wm. Seward, Chas. Davis, E. Molyneux, Sunflower, Stanstead White, W. W. Cole, and Viviand Morel. Incurved: Mons. R. Bahuant, Queen of England, Alfred Salter, Lord Alcester, Jeanne d'Arc, Baron Hirsch, Emily Dale, Empress of India, Madame Darrier, Violet Tomlin, Lord Wolseley, and Prince Alfred. Reflexed, two of each: King of Crimsons, Chevalier Domage, Golden Christine, Cullingfordi, Mrs. Forsyth, and James Carter. Mr. J. Edwards, gardener to H. Tate, jun., Esq., Allerton Beeches, was second with splendid blooms. Mr. D. Heany, gardener to H. G. Schintz, Esq., Mossley House, was placed third, his stand of Japanese being admirable. The fourth prize went to Mr. R. Foster, gardener to Mrs. Thompson. The fourth prize went to Mr. R. Foster, gardener to Mrs. Thompson, Thingwall Hall, near Liverpool.

For eighteen incurved Mr. Jellicoe was again first, showing Mons. R. Bahuant, Madame F. Mistral, Madame Darrier, Lord Wolseley, Baron Hirsch, and Mrs. Coleman in fine form. Mr. C. Osborne, gardener to Arthur Cook, Esq., Aigburth Hall, was second; the third prize going to Mr. J. Haynes, gardener to Mrs. B. C. Nicholson, Oswaldcroft, Woolton, a fine exhibit. In the class for twelve incurved Mr. Jellicoe again took a fine exhibit. In the class for twelve incurved Mr. Jellicoe again took first honours, Mr. T. Healey, gardener to Colonel Wilson, Hillside, Allerton, being second. The prizes in another class for a similar number went to Mr. H. Howard, gardener to A. S. Mather, Esq., Beechwood, Woolton, and Mr. W. Wilson, gardener to H. Cunningham, Esq., Gorsey Cop, Gateacre. For six incurved Mr. W. Hignett, gardener to C. W.

Carver, Esq., Woodbourne, West Derby, was successful. In the class for eighteen Japanese Mr. C. Osborne came out in strong force, having grand blooms of Etoile de Lyon, Gloire du Rocher, Sunflower, Florence Davis, Viviand Morel, Marie Hoste, and Mrs. F. Jameson. Mr. T. Healcy staged well for a second place. Mr. Jellicoe was third. For twelve Japanese Mr. Sydney Bremmell was an easy first, having very fine Viviand Morel, Excelsior, William Seward, William Lincoln, and Beauty of Exmouth. Mr. J. Edwards was second. In the class for twelve Japanese the honours went to Mr. Hignett, gardener to C. W. Carver, Esq.; the second prize going to Mr. P. Greene, gardener to L. H. Macintyre, Esq., Greenheys, Aigburth. For six Japanese Mr. E. Wharton, gardener to J. Findlay, Esq., Mavis Court, Sefton Park, was first. The same exhibitor was also first for six reflexed and twelve Pompons, in bunches of three flowers, with fresh examples. Mr. J. Broome, gardener to Thos. Harrison, Esq., Belle Vale, Gateacre, was first with Anemone flowered beautiful blooms. In the class for six incurved and six Japanese for those who have never won a prize at the Show, Mr. J. Grant, gardener to W. S. Gladstone, Esq., Thornlea, Aigburth, was successful out of several very fair stands.

Rarely have such grand trained plants been seen at Liverpool as they were on this occasion. Mr. W. Wilson, gardener to H. Cunningham, Esq., who was first in the classes for three large flowering, one large flowering, one Pompon, and second for one pyramid. The second prizes going in the two former to Mr. J. Harrison, gardener to Mr. W. G. Bateson, Esq., Aigburth, who was also first for three Pompons and a highly effective group of Chrysanthemums arranged for effect not to exceed 60 square feet. The second places for three Pompons and one Pompon falling to Mr. J. Rose, gardener to J. C. Kitchen, Esq., Huyton. For one pyramid one standard, six untrained and one untrained Mr. T. Gower, gardener to J. A. Bartlett, Esq., Mossley Hill, was the most successful exhibitor.

Miscellaneous plants have seldom been seen to greater advantage particularly the splendid examples of Crotons Montfontainensis and Countess which secured Mr. Jellicoe the first prize for six stove and greenhouse plants. Mr. T. Healey was second, having a good Erica and Croton Williamsi, Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, being third, in which a choice Daphne indica rubra was conspicuous. The class for Orchids attracted much attention by a charming plant in the first prize collection of Mr. Cromwell, Oncidium crispum, with over 200 fully developed flowers. Palms, Ferns, Mignonette, Primulas, Cyclamen, table plants, and Poinsettia were admirably represented, the winners being Messrs. Gower, Cromwell, McFall, P. Greene, J. Kelly, and A. Lewis.

As was anticipated, the fruit made one of the finest displays ever seen in St. George's Hall. For six dishes Mr. J. Wallis, gardener to R. Sneyd, Esq., Keele Hall, Staffordshire, was placed first. Mr. T. Elsworthy second; Mr. J. Barker, Rock Ferry, being a good third. Messrs. Glover, T. Ferguson, W. Wilson, G. Middleton, and J. Wallis were winners in the Grape classes. The chief prizes for Apples were won by Messrs. Davis, Hannagan, Cromwell, R. Pinnington, Large, and Owen. The arrangements were excellent, and the Show was a credit to

all concerned.—R. P. R.

WELLS .- NOVEMBER 7TH AND STH.

THE very cold weather which prevailed on the first day of the Show rendered the staging of tender plants difficult and risky. In spite of this disadvantage the groups of Chrysanthemums and miscellaneous plants, arranged in the Council Chamber of the Town Hall, were quite up to the usual high standard of excellence. One of the Judges characterised the premier group the prettiest and most perfect he had yet seen.

In the class for large groups, open to all, Mr. Williams, gardener to J. F. Hall, Esq., Sharcombe, led with a light arrangement, Orchids in variety, and Crotons, brightly coloured plants of Croton Warreni, being effectively employed as a draping for the Cyclamen, Cattleyas, and other plants which faced the group to the boundary lines. Mr. Fewtrell, gardener to C. C. Tudway, Esq., secured the second prize, Mr. Payne, gardener to the Lord Bishop being third. The smaller group were also

of great merit, Mr. Jas. Gardner securing the first prize.

Cut blooms were numerous and good, the Japanese being exceptionally fine, but the incurved flowers have been seen in better condition For twenty-four blooms, distinct, twelve incurved and twelve Japanese, Mr. Williams was first, showing—Japanese, back row: Edwin Molyneux, Puritan, Col. W. B. Smith, W. Tricker. Middle row: Miss Florence Davis, Sunflower, Viviand Morel (extra good), W. H. Lincoln. Front row: Mons, Bernard, Madame John Laing, Avalanche, and Edwin Lonsdale. Incurved, back row: M. R. Bahuant, Golden Empress, John Doughty, Jeanne d'Arc. Middle row: Lord Alcester, Alfred Salter, Queen of England, Lord Wolseley. Front row: Princess of Wales, Mrs. Coleman, Mrs. Heale, and Miss Haggas. Mr. Fewtrell was second, Mr. Payne third. Mr. Fewtrell had the best board of incurved, Mr. Williams second, Mr. Payne third.

In the class for twelve Japanese, distinct, Mr. Payne led, followed by Mr. Currey and Mr. Williams in the order of their names. Anemoneflowered Chrysanthemums were sparingly staged; Mr. Fewtrell being

first in the class for twelve blooms.

Mr. Williams was first with two specimen plants; Mr. Currey securing a similar award for four table plants. Trained plants were well shown by Mr. Porter, gardener to A. Colson, Esq., who secured the principal prizes in that section. The National Chrysanthemum Society's certificates were awarded to Mr. Payne for a bloom of Queen of

England, and Mr. Porter for a plant of Lord Wolseley.

Fruit was not quite equal to last year's display, Messrs. Payne, King, Isgar, Fewtrell and Mackenzie, being the principal prizewinners. Messrs. Jarman & Co. showed a large table of fruit and vegetables; Messrs. Brown & Sons having a similar exhibit. Messrs. Mogford & Son exhibited a magnificent bouquet of Violets which was greatly admired. Messrs. Payne and Currey obtained awards for floral decorations; numerous awards were also made for windows, baskets, &c., decorated with autumn foliage and berries. About 800 school children of the neighbourhood visited the Show on the morning of the second day-feature for which the officers and Committee are to be congratulated.

TORQUAY .- NOVEMBER 8TH.

As usual the annual autumn Exhibition was held in the Bath Saloon. The groups were artistically arranged about the room, some in circular form, others square, so that a full view of them was obtained.

The entries in the cut bloom classes were not quite so numerous as in some former years, yet sufficient were contributed to make an excellent display. The groups lacked nothing, either in numbers or individual quality. Several classes were provided for groups of Chrysanthemums arranged for effect, the principal one being for an arrangement in a circle, 8 feet in diameter, in not less than eighteen varieties. Mr. J. Hunt, gardener to P. B. Drinkwater, Esq., Lyncombe, Torquay, won the premier position, having dwarf plants of mixed sections, carrying well developed blooms and furnished with good foliage, not too much crowded. Mr. J. Hill, gardener to the Rev. H. Rutherford, Red Cliffe, Torquay, was a good second. Mr. F. Ferris, gardener to J. W. Kimber, Esq., Tracey, Cockington, third. In a smaller class, Mr. W. Satterly,

gardener to Mrs. Matthews, Braddon Villa, Torquay, won the first prize with a most creditable display. In the class for a group of miscellaneous plants arranged for effect, the tallest plant not to exceed 10 feet high. Mr. Satterley was an easy first with a bright arrangement; Mr. H. Dammerell, gardener to Lady Macgregor, Glencarnock, Torquay, second. Orchids were most creditably shown by Mr. G. Medland, gardener to Morton Sparke, Esq., Rooklands, Torquay, and Mr. J. Slowman, gardener to Captain Fane Tucker, Braddon Tor, Torquay. Mr. Satterley had the best table plants, compact plants of suitable kinds, well coloured.

Cut blooms were good in quality if not numerous. The principal class was for thirty-six, half incurved and the remainder Japanese. There was but one exhibitor, however, in this class—Mr. Foster, gardener to H. H. Spencer, Esq., Teignmouth, who was worthily awarded the first prize. The Japanese were heavy fresh, and well arranged. Col. B. Smith, E. Molyneux, Viviand Morel, Mrs. F. A. Spalding, A. H. Lingels, Vice President, Andiquier, and Princess, May were the most Lincoln, Vice-President Audiguier, and Princess May were the most noteworthy. The incurved were large and neatly set up. For twelve incurved several good stands of blooms were staged. Mr. H. Veale, incurved several good stands of blooms were staged. Mr. H. Veale, gardener to the Rev. A. H. Simms, Wolborough Rectory, Newton Abbott, was first with heavy fresh blooms, Princess of Wales, Lord Alcester, Jeanne d'Arc, and Madame Darrier were prominent. Mr. Foster second. The last two exhibitors changed places in the next class, that for twelve Viviand Morel, Edwin Molyneux, Violet Rose, Mdlle. M. Hoste, Etoile de Lyon, Col. W. B. Smith, and Alberic Lunden were exceedingly meritorious. Mr. Veale also staged well.

Anemone blooms were thoroughly well represented. Mr. Veale was an easy first with six varieties; Gluck, Grand d'Alveole, Mrs. Judge Benedict, Miss A. Lowe, and Delaware were the best. For six reflexed, any one variety, Mr. J. Slowman showed Cloth of Gold in really good condition, and took first prize. Mr. Veale staged Mrs. J. Benedict in the class for six of any one Anemone variety for first prize; he also won first prize for six incurved, any one variety, with compact examples of Jeanne d'Arc, and for the same number Japanese, in one variety, with

Viviand Morel. Mr. Foster was second.

In the class for six single-flowered blooms, Mr. Wilkinson staged well developed blooms of Admiral T. Symonds, Mr. Satterley was second. Mr. Foster had the premier Japanese bloom, an almost perfect one of Viviand Morel, a similar honour falling to Mr. Veale in the incurved section for Jeanne d'Arc. For distinct for twelve incurved and twelve Japanese, confined to the district, there was strong competition, Messrs. Satterley and Wilkinson being first and second in the order of their names.

Fruit made a good display. Mr. Foster won premier honours for black Grapes with Alicante good in every respect. Apples and Pears

were admirably shown.

Non-competitive groups were numerous. Messrs. R. Veitch & Son, Exeter, had a collection of Orchids. Mr. W. B. Small, Torquay, had a large group of Chrysanthemums, representing many of the newer kinds. Messrs. Curtis & Sanford, Torquay, had a similar group. Messrs. W. H. Burridge & Sons staged a very attractive group of miscellaneous flowering and foliage plants from the South Devon Fruit Farm, Torquay. Mr. Pender brought excellent Tomatoes, Mushrooms, and Gros Colman Grapes.

CIRENCESTER .- NOVEMBER 8TH AND 9TH.

THIS Society under the able direction of the Honorary Secretary, Mr. Frank Sare, assisted by a good working Committee, continues to make progress, the gardeners well backed up by amateurs and cottagers,

arranging a really fine all-round Exhibition.

There were two classes for groups of Chrysanthemums, those occupying a space of 63 square feet being allowed to use Ferns and fine-foliaged plants. In this instance Mr. T. Arnold, gardener to Earl Bathurst, Cirencester, was first. The second prize went to Mr. Bathurst, Cirencester, was first. The second prize went to Mr. W. Larner, gardener to J. Hyde, Esq. With smaller groups four competed, Mr. T. Painter, gardener to C. Green, Esq., being a good first; Mr. J. Young, gardener to W. Warne, Esq., second; Mr. J. Rouse, gardener to J. Mullings, Esq., third; and Mr. W. Kirby, gardener to F. Sare, Esq., highly commended. Specimen plants were fairly good, and with these the most successful were Mr. O. Orpet, gardener to the Misses Brown: Mr. G. Rignell gardener to Mrs. Brewin: Mr. the Misses Brown; Mr. G. Bignell, gardener to Mrs. Brewin; Mr. H. R. Saunders, gardener to James Taylor, Esq.; and Mr. W. Ezzle, gardener to the Rev. G. A. C. Kempson. Cottagers also exhibited quite a large number of well-grown plants. Three gardeners competed with groups of miscellaneous plants, but Mr. T. Arnold was very easily first Mr. D. Elkins was a creditable second; and Mr. O. Orpet third. Bouvardias, Poinsettias, Cyclamens, Mignonette, Zonal Pelargoniums, and table plants were all remarkably well shown, principally by the gardeners already

Cut blooms were more numerous and of superior quality generally to what have previously been seen at Cirencester. In the class for eighteen each of Japanese and incurved varieties, the first prize went to Mr. G. Price, gardener to Mrs. Bulley, who had W. H. Lincoln, E. Molyneux, Florence Davis, W. Tricker, Miss A. Hartshorn, Viviand Morel, Alberic Lunden, Stanstead White, A. H. Neve, Mrs. F. Jameson, Sarah Owen, Sunflower, Boule d'Or, Gloire du Rocher, Avalanche, Golden Wedding, Elainc, and J. Délaux of Japanese varieties, and large solid blooms of incurved Empress of India, Lord Wolseley, Jeanne d'Arc, Prince Alfred, Lord Alcester, Mons. Bahuant, Miss Haggas, Princess of Wales, Mrs. Coleman, Violet Tomlin, Empress Eugénie, John Salter, Pink Venus, Queen of England, Jardin des Plantes, Princess Beatrice, Madame Darrier, and Refulgens. Mr. D. Elkins was second, his blooms being also very good. Mr. Price was again well first with twenty-four blooms, twelve each of Japanese and incurved. Mr. Elkins was second. For twelve Japanese Mr. Price was again first, Mr. F. Exell, gardener to E. A. Leatham, Misarden Park, being a good second, and Mr. Elkins

Mr. Elkins was first. Mr. Price was second in this class and first with twelve reflexed blooms. The classes for vases of Chrysanthemums with Fern fronds was particularly well filled, several ladies competing.

The silver medal of the National Chrysanthemum Society was

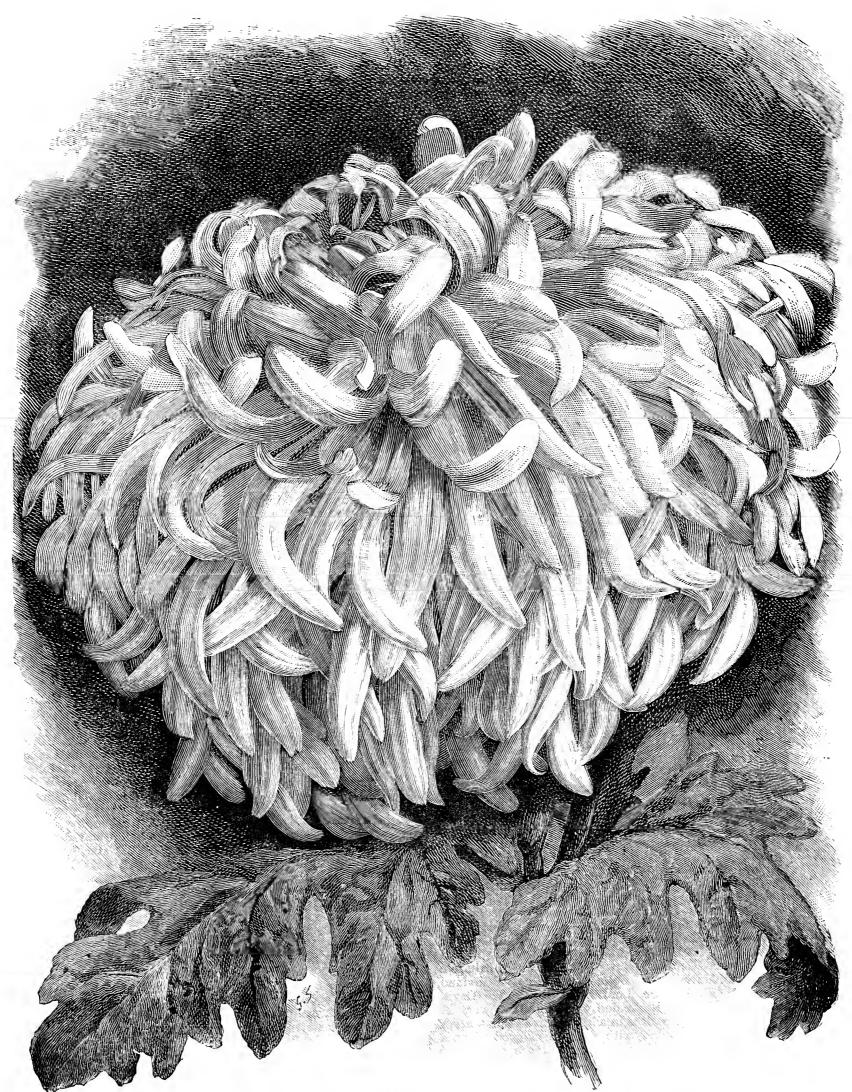

FIG. 65.—CHRYSANTHEMUM MDLLE. THÉRÈSE REY. (See page 445.)

third. The competition in the class for six blooms of any one Japanese variety was very keen, Mr. F. Exell winning the first prize with Viviand Morel; Mr. Price being second with Mdlle. Marie Hoste; and Mr. W. Taylor third with Avalanche. With Anemone-flowered varieties

awarded to Mr. Arnold for his admirable group of Chrysanthemums, and the certificates went respectively to Mr. G. Bignell for a fine specimen plant of Viviand Morel, and Mr. Price for collection of cut blooms.

Fruit and vegetables were shown, the prizes being principally won by Messrs. Exell, Arnold, Price, and others, whose names have repeatedly appeared in this report. Mention must also be made of the grand bank of Chrysanthemums, and a variety of other flowering and fine-foliage plants, arranged, not for competition, by Messrs. John Jeffries & Son,

KIDDERMINSTER .- NOVEMBER STH AND 9TH.

This, the first annual Exhibition of the recently formed Kidder-minster Chrysanthemum Society, was held in the Town Hall on the above dates under very favourable auspicies, and it is hoped, considering the patronage afforded, that it will prove an annual event. Considering the first attempt, the arrangements were admirable, and well carried out

by the very efficient and hard-working Committee.

Not the least praiseworthy exhibits were the non-competitive groups of plants and stands of blooms which were set up by neighbouring gentlemen. Particular mention must be made of the magnificent group gentlemen. Particular mention must be made of the magnificent group arranged by Mr. T. Poole, gardener to W. Hatton, Esq., Hill Grove; also Mr. W. Farrant, gardener to Mrs. Brown-Westhead, Lea Castle; Mr. J. Kemp, gardener to Sir Thos. Lea, Bart., M.P.; and Mr. C. Lee, gardener to F. Elkington, Esq.; likewise the stands of blooms by Mr. R. Parker, gardener to J. Corbett, Esq., Impney Hall, Droitwich; G. W. Grosvenor, Esq. (gardener, Mr. Gold); R. B. Martin, Esq., M.P., and A. F. Godson, Esq., M.P. Another very praiseworthy non-competitive exhibit was nine fine bunches of Grapes set up by Mr. T. Poole. These comprised equal numbers of Mrs. Pince, Gros Colman, and Lady Downe's; all beautifully finished.

For a group of Chrysanthemums the first prize was awarded to For a group of Chrysanthemums the first prize was awarded to Mr. F. Walters, gardener to A. Baldwin, Esq., M.P., Wilden House, Stourport. Second, Mr. H. J. Dines, gardener to W. F. Spencer, Esq., Spring Grove, Bewdley. Third, Mr. T. Hooper, gardener to Major Goodwin, J.P. The next class was for a group of Chrysanthemums, flowering and foliage plants, arranged for effect, and here Mr. J. Woodberry, gardener to E. C. Newmarch, Esq., The Lakes, was awarded the

first prize, Mr. W. F. Spencer second, and Mr. T. Hooper third. One specimen plant (Japanese).—First, Mr. T. Hooper and second Mr. G. Whikeman, gardener to the Bishop of Worcester.

In the class for twenty-four cut blooms, half to be Japanese and half incurved, Mr. S. Wallis, gardener to Mrs. Nash, Severn House, Bewdley, was well ahead, he having, amongst others, good blooms of Japanese, ley, was well ahead, he having, amongst others, good blooms of Japanese, Sunflower, Mdme. E. A. Carrière, Viviand Morel, Mdlle. Marie Hoste, and Avalanche. Second, Mr. T. Hooper. With twelve blooms of Japanese Mr. D. Thomas, gardener to the Rev. J. L. Chesshire, gained the premier award for a really beautiful stand, Mr. F. Walters and Mr. T. Hooper having the remaining prizes. For twelve blooms of Japanese, the same number of incurved, and also for six of each section, the prizes were divided between Mr. J. Smith, Mr. D. Thomas, Mr. G. Whikeman, Mr. H. J. Dines, and F. Walter.

The remaining sections of the exhibition were devoted to Primulas, Zonal Pelargoniums, Ferns and fruit, this latter section comprising good stands of Grapes, Apples, and Pears, besides honorary exhibits of fruit and vegetables:

HORNSEY.-NOVEMBER 8TH AND 9TH.

On each occasion during the past four years the annual Exhibition of the Hornsey and District Chrysanthemum Society has proved a success from an horticultural point of view, if not always financially. The same may be said of the Show this year, which was held in the National Hall, Hornsey, on the above dates, and it is to be hoped that the returns were such as to relieve the Society from the slight financial embarrassment with which the current year was started. Much credit is due to Mr. Courtney Page, the Honorary Secretary, and to Mr. Newman, the Secretary, for the admirable manner in which the exhibits were arranged. The cut blooms were remarkably good, as also were the groups and trained plants. In addition to these there were flowers and plants from the gardens of the President of the Society, H. R. Williams, Esq., J.P., which assisted much in forming one of the best autumn shows ever held in the district.

The Japanese blooms in most of the open classes were exceptionally fine, especially those shown by Mr. E. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey. This well-known exhibitor was in his best form, and secured the first prize in the class for twenty-four Japanese. The flowers staged were large and well finished, and included Golden Dragon, Excelsior, Mdlle. Thérèse Rey (grand), President Borel, Mrs. Falconer Jameson, Vice-President Audiguier, a seedling named Hoar Frost, Van der Heede, Kentish Yellow, G. C. Schwabe, Primrose League, W. Seward, Mdlle. Marie Hoste, Colonel W. B. Smith, Viviand Morel, C. Shrimpton, Mr. E. Whittle, Lord Brooke, Florence Davis, Claire de Beaber, Alberia Lundon, Etaile de Lyon, and Sunflower, Alberta Lundon, Etaile de Lyon, and Sunflower, and Sunflower, and Sunflower, and Sunflower, and and alberta Lyon, and and alberta Lyon, and and alberta Lyon, and and alberta Lyon, and alberta Lyon, and and alberta Lyon, and alberta L Gloire du Rocher, Alberic Lunden, Etoile de Lyon, and Sunflower. A certificate was granted to Mr. Rowbottom in addition to the first prize. Mr. J. Brookes, Highgate, was second with a stand of good blooms. Mr. A. Bonyard, 85, Fairfax Road, Hornsey, secured the special prize open to amateurs for eighteen blooms of Japanese, incurved, and reflexed varieties. Mr. W. Lester was second, and Mr. B. R. Durrant third. Mr. Sears, Gordon Road, Hornsey, won another prize given by the President. Mr. W. Northormer, 23, Wolsely Road, Crouch End, secured the silver cup given by Messrs. W. Wood & Sons, of Wood Green, for eighteen Japanese blooms, showing these in splendid condition.

The class for twelve incurved blooms brought forth a good competition. Mr. J. C. Turk, gardener to F. Boney, Esq., Cholmelly Lodge, Highgate, secured the first prize with a stand of neat blooms. The

varieties shown were Lord Wolseley, Princess of Wales, Madame F. Mistral, Mrs. Heale, Prince Alfred, Mrs. Coleman, Violet Tomlin, Miss M. A. Haggas, Refulgens, Baron Hirsch, White Beverley, and Madame Darrier. The second prize went to Mr. Rowbottom, who had much larger flowers than those in the leading stand, but they were rather rough. There were, however, fine examples of Baron Hirsch, Madame Darrier, and Jeanne d'Arc included in the stand. Mr. G. Amos, gardener to W. Lister, Esq., Ladywell, Hornsey, was third. Mr. Rowbottom had the best six blooms of one incurved variety, showing Mr. J. Brooks followed with the same variety, and Madame Darrier. Mr. E. Jones was third with neat examples of Mrs. Geo. Rundle.

Mr. Turk was placed first for a stand of thirty-six Pompons, twelve varieties, three blooms of each. The flowers staged were remarkably good, especially Black Douglas, Comte de Morny, and Nellie Rainford. Mr. E. Rowbottom was a good second with fine blooms. Mr. Rowbottom was first with six Japs, showing magnificent blooms of Col. W. B. Smith. Mr. J. Brookes was second with good blooms of Avalanche, Mr. E. Jones following with Viviand Morel. The class for twelve Japanese brought forth a good competition, the first prize, however, falling to Mr. Rowbottom, who was followed by Messrs. T. L. Turk and W. Northover, all staging fine blooms. The same exhibitors were placed first, second, and third respectively in the class for eighteen blooms, the prizes being given third respectively in the class for eighteen blooms, the prizes being given by Mrs. Williams. Mr. Rowbottom also gained the first prize in a special class for twelve large Anemone flowered varieties, steging these in fine condition. Mr. G. Amos was second. In the amateurs' and cottagers' sections the cut blooms were very good, and reflected credit upon the growers. Mr. J. Newman, 28, St. Joseph's Road, Hornsey, secured several prizes, including a first for Pompons, and for which also a certificate was awarded.

Groups and trained plants were well represented. For the best group of Chrysanthemums arranged for effect, Mr. E. Rowbottom was placed first with an excellent collection of well grown plants. Mr. G. Amos was second with a creditable arrangement. In another class for a group, Messrs. Sears, Durrant, and Courtney Page secured the prizes. Mr. J. Brookes had the best four trained plants, these being fine specimens and well flowered. A certificate was also awarded for this exhibit. Mr. B. R. Durrant was second, and Mr. G. Amos third. Mr. Brookes likewise succeeded in gaining the special prize given by Mr. C. W. Cousins of Wood Green for two trained specimens. Table plants, Primulas, and bouquets of Chrysanthemums were well shown by Messrs. E. Rowbottom, J. Brookes, G. Amos, and W. Wilkinson.

Miscellaneous exhibits included a group of plants from Mr. A. M Gregor, Prospect Nursery, Turnpike Lane, Hornsey, who also had a number of tastefully made bouquets and wreaths, which formed quite a feature in the Show.

Fruit and vegetables were extensively shown in various classes, as also were bouquets and floral decorations, but want of space precludes further mention.

BATH.—November 8th and 9th.

THIS Show was held under rather more favourable circumstances as regards the weather than usual, and was better attended accordingly. With the exception of trained specimens the display was well up to the high standard always maintained at Bath.

Groups of Chrysanthemums were a great feature, the competition being very keen and close. Mr. W. Davis, gardener to S. P. Budd, Esq., Bath, was placed first, his group being remarkably well finished. There were also fine flowers in the banks formed by Mr. Kerslake, gardener to the Rev. E. Handley, and Mr. Southard, gardener to W. J. Brown, Esq., who were respectively second and third. This year, for the first time, prizes were offered for groups of Chrysanthemums with foliage plants and Ferns, and in this instance Mr. T. J. Tate, gardener to W. Pumphrey, and Ferns, and in this instance Mr. T. J. Tate, gardener to W. Pumphrey, Esq., was first, his arrangement being less formal and more attractive than that which gained R. B. Cater, Esq., the second prize. Messrs. J. Southard, Charles Lee, T. J. Tate, and J. West were among the most successful with trained plants, but these, as before stated, were not good. Miscellaneous plants were well shown by R. B. Cater, Esq., and Mr. W. Bergren, and ornamental foliaged plants by Messrs. E. S. Cole & Sons and J. T. Holmes, Esq. Orchids were remarkably good for the time of year, the first prize for a group shown by J. T. Holmes, Esq. Mr. R. B. Cater was a good second. Table plants were well shown by Mr. W. Strugnell, gardener to W. H. Long, Esq., M.P., Rood Ashton, and Mr. T. J. Tate. There was a good display of Primulas, Cyclamens, and Bouvardias.

Cut blooms may fairly be said to have well saved the reputation of the Show. In every class the competition was very close and good, the Judges having a most difficult matter to decide which should have the prizes. In the premier class, that for twenty-four Japanese varieties, distinct, Mr. J. Aplin, gardener to W. M. Baker, Esq., Gloucester, was first, having massive and fresh blooms of Alberic Lunden, Avalanche, D. B. Crane, Sunflower, Excelsior, E. Molyneux, Ruth Cleveland, Primrose League, Charles Davis, Mons. Henri Robert, White Louis Boehmer, W. Seward, Viviand Morel, Edward Beckett, Mrs. C. W. Wheeler, Robert Owen, A. H. Lincoln, A. H. Neve, Kate Mursell, Prefect Robert, Gloire de Rocher, and W. Tricker. Mr. P. Mann, gardener to W. H. Laverton, Esq., Westbury, was awarded the second prize. Mr. Robinson, gardener to Lord Justice Lopes, Westbury, took the third prize. In the class for twelve Japanese varieties Mr. P. Mann was first, having fine blooms of G. C. Schwabe, Etoile de Lyon, F. W. Flight, M. E. A. Carrière, A. H. Lincoln, Condor, Excelsior, Princess May, Sunflower, Mrs. C. W. Wheeler, Viviand Morel, and Col. Smith. Mr.

Robinson was a good second, and Mr. W. Strugnell a creditable third. The best six varieties were shown by Mr. W. Follen, gardener to

J. D. Willis, Esq.; Mr. Tucker, gardener to Major Clarke, being second, and Mr. Tickle, gardener to T. Carr, Esq., third.

The competition with large flowering Chrysanthemums was not quite so strong as in the foregoing classes, though better than at one time anticipated. Mr. I. Aplin was well fort for twenty four vericies. anticipated. Mr. J. Aplin was well first for twenty-four varieties, staging fresh and fairly massive blooms of Lord Alcester, Mons. Bahuant, Mrs. Robinson King, Empress of India, John Lambert, Princess of Teck, Camille Flammarion, Princess of Wales, Mrs. Clibran, Matthew Russell, Hero of Stoke Newington, John Salter, Miss B. Wilson, Queen of England, Lord Wolseley, Golden Empress, Miss Haggas, Madame Darrier, Jeanne d'Arc, Lady Dorothy, Mrs. N. Davis, Empress Eugénie, Florence McDonald, and Nil Desperandum. The second prize was well won by Mr. G. H. Copp, gardener to W. G. S. Erle Drax, Esq., Sherborne, and Mr. Robbson was third. For twelve varieties Mr. J. H. Copp was first, John Salter, Mons. Bahuant, Nil Desperandum, and Mrs. Robinson King being the best in his stand. Mr. P. Mann followed closely, while the third prize went to Mr. W. Marsh, gardener to T. P. W. Butt, Esq. Mr. W. Follen was first, Mr. Tucker second, and Mr. G. Pymm, gardener to Mrs. Gouldsmith, third, for six varieties.

The best Anemone-flowered varieties were shown by Mr. Robinson, the second prize going to Mr. Aplin. The former was also awarded a first prize for six new varieties sent out since 1889, winning with W. K. Woodcock, J. S. Dibben, Beauty of Exmouth, Viviand Morel, and Mrs. Nisbet. Mr. P. Mann was second. Mr. Robert Owen, Maidenhead, staged twelve new Japanese varieties that have been duly certificated, but were not shown at their best or sufficiently large to judge of their merits. They consisted of Thomas Hewett, R. Dean, Mr. G. B. Darby, Thomas Wilkins, Rose Wynnc, W. H. Fowler, Duke of York, Charles Davis, Viscountess Hambledon, and Etna. The champion bloom in the Show was found in a perfect flower of incurved Mrs. Robinson King, shown by Mr. J. Aplin.

Fruit, as usual, was extensively shown, and of excellent quality. For a collection of six dishes, Mr. W. Nash, gardener to the Duke of Beaufort, Badminton, was well first. Mr. Pymm was second; and Mr. J. Gibson, gardener to Earl Cowley, Chippenham, third. Mr. W. Taylor was first for four bunches of Grapes in two varieties. Other Grapes of high finish were well shown by Miss Marriott, Mr. Taylor, and Mr. Nash. Apples were remarkable for their size and rich colouring, and Pears were also good. Among the prizewinners were Messrs. Hall, Strugnell, Garraway, Dunn, Leeson, and H. Taylor.

BOURNEMOUTH.-NOVEMBER STH AND 9TH.

THE seventh Exhibition of this Society was held in the Winter Gardens, and a more suitable place for the purpose could scarcely be found. The space was again taxed severely, several good groups being arranged around the sides, while the cut flowers were plentiful. Fruit and vegetables were also there in abundance. In the cut bloom section the principal attraction was in the class for thirty-six (eighteen Japanese and eighteen incurved); first prize a silver challenge cup, value £10 10s., to become the absolute property of any exhibitor winning it twice, with money prizes added. Mr. N. Molyncux, gardener to J. Carpenter, Esq., Rooksbury Park, Wiltshire, was well ahead of the other competitors with the following collection:—Viviand Morel, G. C. Schwabe, Mdlle. Marie Hoste, Etoile de Lyon, President Borel, Lord Brooke, Viviand Morel, Col. W. B. Smith, Charles Davis (the finest bloom we have seen exhibited this season), Alberic Lunden, Etoile de Lyon and Gloire du Rocher. Incurved included Queen of England, Lord Alcester, Golden Empress, Empress of India, Beauty, Mrs. Robinson King, John Lambert, John Lambert and Miss Haggas. His collection was in splendid condition, being large and well finished. Mr. Thos. Wilkins gardener to Lady Theodora Guest, Henstridge, was placed second, and Mr. G. W. Taylor, gardener to Mrs. Elphinstone, third

For twelve Japanese Mr. Wilkins was awarded first honours with Viviand Morel, Colonel W. B. Smith, H. H. Neve, Gloire du Rocher, Edwin Molyneux, Mrs. J. S. Fogg, Etoile de Lyon, Florence Davis, Evelsion Sunflewer Vel d'Anderes and Conden Mr. Torlor nes canada. Excelsior, Sunflower, Val d'Andorre, and Condor. Mr. Taylor was second, and Mr. Grace, gardener to W. R. Neave, Esq., third, all showing well. In the corresponding class for twelve incurved blooms Messrs. Molyneux, Taylor, and Grace shared the honours in the order of their names. Anemones were well shown by Mr. Grace, who secured the first position; and Mr. Phillips, gardener to T. J. Hamkinson, Esq., the second.

Reflexed blooms were well shown by Mr. Woolford, gardener to Mrs. Trevor Goff, Lymington, and Mr. T. Head, gardener to Mrs. C. Stuart, Christchurch, who were placed first and second respectively. Mr. Woodford's collection consisted of Amy Furze, Christine in all the varieties (Golden, White, Pink, and Peach), King of the Crimsons, Chevalier Domage, and Cullingfordi; these were all well finished. Japanese bloom was shown by Mr. Ingram, and it was a glorious flower of Mrs. Alpheus Hardy. The now well known Viviand Morel secured the second and third positions.

In one class for groups of 60 feet, Mr. T. K. Ingram, Parkstone, was a splendid first, well arranged, bright, and dwarf. In another class for 50 square feet, Mr. Eldridge, gardener to G. W. Young, Esq., obtained the premier position. Mr. G. Scretch, gardener to the Misses Evans, was awarded the second prize. Mr. G. J. Fenwick was a good third. For a 40 square feet group Mr. Charles Brampton, the Rev. J. Rodgers, and Mrs. Squires were placed in the order of their names; and for one 30 squarc feet the awards fell to Mr. T. W. Tharle, Mr. Frank Hardy,

and W. H. Mate, who were placed first, second, and third respectively, all exhibiting grandly.

Fruit, vegetables, dinner-table plants, epergnes, bouquets, shoulder sprays, buttonholes, and honey, all in their separate classes, well contested, and made a large and attractive display. The Show was patronised by a large and fashionable assembly. Mr. Spong, the zealous patronised by a large and fashionable assembly. Mr. Spong, the zealous Sccretary, Mr. Swaffield, the Treasurer, and Dr. Hitchcock, the Referee, and others of the Executive laboured hard to make it a success, and their efforts were rewarded.

WEYBRIDGE.—NOVEMBER 9TH.

THE nineteenth annual Exhibition of the Weybridge and District Chrysanthemum Society was held on the above date. Though not large the Show was a highly meritorious one, the cut blooms especially being of splendid quality. Taken as a whole the Show was a slight improvement on its predecessors, due probably to the energetic action of Mr. G. Masters, the Secretary, and to the Show Committee, by whom the

arrangements were carried out in a praiseworthy manner.

The principal class was for forty-eight blooms, to include twenty-four Japanese and twenty-four incurved, in not less than thirty-six distinct There were three competitors, Mr. Carpenter, gardener to Major Collis Browne, Byfleet, proving an excellent first. staged were fresh, clean, and weighty, amongst the best being Mrs. Harman Payne, Viviand Morel, Edwin Molyneux, Col. W. B. Smith, William Seward, Gloire du Rocher, Sunflower, Excelsior, Lord Brooke, John Doughty, Queen of England, Baron Hirsch, Princess of Wales, Madame Darrier, Alfred Salter, Mrs. G. Coleman, Lord Alcester, and Alfred Lyne. Mr. J. Quartermain, gardener to C. E. Smith, Esq., Cobham, was second; and Mr. J. Cook, gardener to J. S. Sassoon, Esq., Walton, third. In the class for thirty-six flowers, eighteen Japanese and eighteen incurved, Mr. J. Hopkins, gardener to Mrs. Woodderman, Walton, was placed first, thereby winning the silver cup. The blooms shown were magnificent, amongst the best being Gloire du Rocher, Col. W. B. Smith, Edwin Molyneux, Sunflower, Viviand Morel, John Doughty, Baron Hirsch, Jeanne d'Arc, and Empress of India. Mr. Quartermain was a close second with handsome examples; Mr. Caryer, gardener to A. G. Meissuer, Weybridge, being third.

Mr. Felgate, gardener to the Duchess of Wellington, Hersham, was first for twelve incurved blooms, distinct, showing fine examples of Queen of England, Empress of India, Alfred Salter, Princess of and Violet Tomlin (superb) amongst others. Messrs. Caryer and Hopkins were second and third in the order of their names. There were six competitors for twelve Japs, distinct, the stands staged being very fine throughout. Mr. R. Ridge, gardener to Swifton Eady, Esq., Weybridge, was a splendid first, Mr. Caryer being a close second, and Mr. Hopkins third. For six Japanese, distinct, Mr. Swan, gardener to G. Murray Smith, Esq., Weybridge, was first, closely followed by Mr. Pagran, gardener to A. F. Hobhouse, Esq., Weybridge, second, and Mr. Cheesman, gardener to — Riddell, Esq., Walton, third. Mr. Thorne, Mr. Thorne, gardener to A. E. Flood, Esq., Walton, took the premier position for six incurved, distinct; Mr. Cawte, gardener to H. Preston Thomas, Esq., Weybridge, was second; and Mr. Cheesman third. For six incurved, one variety, Mr. Hopkins was first with Violet Tomlin in magnificent form, Mr. Felgate being second with the same variety, Mr. Ridge being third with M. P. Martignat. Mr. Stedman was first with Sunflower in the class for six Japs, one variety, Mr. Felgate being second, and Mr. Ridge third. For twelve reflexed blooms Mr. Pagran was accorded the premier position, Messrs. Caryer and Felgate being second and third Mr. Cawte, the only competitor in the class for twelve as named. Anemone Pompons, and was deservedly awarded the first prize. There were two competitors for six specimen plants, dwarf trained, Mr. Cawte being placed first, closely followed by Mr. Swan

Bouquets were shown in great numbers, and in the one to which the premier award was given the arrangement was charming, perfect taste having been shown in the placing of the flowers by Mrs. Flood. Fruit was largely shown, Apples and Pears being splendid. Mr. Davies, gardener to G. Churchill, Esq., Weybridge, arranged a stand of forty-

eight grand blooms not for competition.

WESTON-SUPER-MARE.—NOVEMBER 9TH.

All things considered this Show was the best of the series of nine exhibitions that have been held in the above mentioned town. Mr. Vanes is the Hon. Secretary, and no fault could well be found with

the way in which he and the Committee do their work.

Specimen plants are particularly well grown in this neighbourhood. The first prize for four large flowering varieties was won by Messrs. Brooks & Son, Weston-super-Mare. Mr. W. Daffurn, gardener to Donald Cox, was second with somewhat smaller but remarkably well grown plants; the third prize going to Mr. C. Holland, gardener to W. Ash, Esq., who also had fine plants. In the corresponding class for Japanese varieties Mr. C. Holland was first, Messrs. W. Brooks & Son were a very close second, and Mr. Daffurn third. For a single specimen Mr. Holland was first for a grand plant of Mrs. Rundle, 6 feet through, and well flowered; Messrs. Brooks & Son being second, and Mr. Daffurn third. The last named took a first prize for standards, Mr. Holland following with plants only slightly inferior. There were several other classes for trained plants, but mention can only be made of the very fine Pompons shown by Messrs. Brooks & Son. Mr. C. Holland also had remarkably good Pompons, his plants being only a little smaller. Prizes were also provided for untrained plants of Japanese, incurved, and large flowered varieties, but the results were not altogether satisfactory.

Messrs. H. Lambert, gardener to the Rev. W. W. Aldridge, W. Treble, gardener to T. Mullins, Esq.; and F. Blackmore, were among the most successful exhibitors of these.

The groups were very much better than usual, and were quite a feature. Mr. H. W. Whitehead, gardener to R. W. Gibbs, Esq., arranged an admirable group. Mr. Summerhayes, gardener to H. Pethick, Esq., was second, Mr. F. Williams, gardener to R. Cox, Esq., being third with a group that would have been well first in previous years. Three good groups of miscellaneous plants were shown, Messrs. Brooks & Son being first, Mr. Daffurn second, and Mr. Summerhayes third. Table plants, Primulas, and such like were also shown in good style.

Cut blooms occupied the best part of two long tables, and but few inferior flowers were seen. The first prize for twenty-four incurved blooms, in not less than eighteen varieties, was well won by Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, who had Lord Alcester, Alfred Salter, Empress of India, Golden Empress, Mons. Bahuant, Jeanne d'Arc, Mrs. Coleman, Prince Alfred, Mrs. Heale, Lord Wolseley, Jardin des Plantes, Miss Haggas, Mrs. N. Davis, Violet Tomlin, Lady Dorothy, Cherub, Hero of Stoke Newington, and Princess Beatrice, all in good condition. Messrs. W. Brooks & Son were second. With twelve incurved varieties Mr. J. Atwell, gardener to J. B. Bain, Esq., Clifton, was first, some of his best being Mr. Brunlees, Jeanne d'Arc, Baron Hirsch, Novelty, Violet Tomlin, and Lord Wolseley. Mr. G. W. Deake, Cardiff, was second; while for six varieties Mr. A. Currey, gardener to C. Bailey, Esq., Frome, was first, and Mr. G. Sutton, gardener to W. A. Todd, Esq., second. The best twenty-four Japanese varieties were shown by Mr. J. Lloyd, who had fine fresh blooms of Etoile de Lyon, E. Molyneux, R. George, Mrs. C. H. Payne, Colonel W. B. Smith, Vice-President Audiguier, W. W. Coles, W. H. Lincoln, Excelsior, Florence Davis, R. Owen, Madame Appuis, G. Daniels, Madame Picard, Prefect Roberts, C. Davis, Viviand Morel, Ralph Brocklebank, J. S. Schwabe, President Borel, Beauty of Castlewood, Miss A. Hartshorn, Louis Boehmer, Sunflower. Mr. Deake was second, and Messrs. Brooks & Son third. Mr. Daffurn was first for twelve varieties. Mr. A. Curry and Mr. J. Atwell were placed equal second. The first prize for six varieties went to Mr. J. Marshall, gardener to J. Dole, Esq., Clifton, Mr. G. Sutton, gardener to W. A. Todd, Esq., being a close second. Mr. Daffurn had the best reflexed varieties, and Mr. Atwell took the second prize.

The bouquets of Chrysanthemums and Fern fronds were particularly attractive, that which gained Messrs. Brooks & Son the premier prize being really beautiful. Mr. J. H. Deaske was second, and Mr. A. Curry third. Messrs. Brooks & Son were also the most successful with other bouquets, vases, and baskets of flowers; this firm also showing a magnificent cross not for competition.

The show of fruit was good. Mr. J. Marshall was first for excellent Alicante Grapes, Mr. Daffurn being second; while in the any other Black class Mr. Daffurn was first for grand bunches of Gros Guillaume, Mr. Curry being second with Mrs. Pince's Muscat in good condition. The best Muscats were shown by Mr. J. Marshall, Mr. J. Atwell being a close second. Messrs. Daffurn, F. Williams, and W. Summerhayes were among the most successful in the Apple and Pear classes.

BIRKENHEAD AND WIRRAL.-NOVEMBER 9TH.

THE seventh annual Exhibition of the above Society was held on the above date, and although the competition in some of the larger classes was not so good as one would have liked, yet everything staged was of high quality. The arrangements were admirable, and every exhibit could be seen to proper advantage.

In the class for eighteen Japanese blooms Mr. T. Ransom, gardener to H. R. Rodger, Esq., Spital, was first, staging in the back row magnificent blooms of Mrs. C. H. Payne, G. C. Schwabe, W. H. Lincoln, E. Molyneux, Marie Hoste, Viviand Morel. Second row: Wm. Seward, Mrs. E. W. Clarke, Gloire du Rocher, Louis Boehmer (very fine), Beauty of Castle Hill, Col. W. B. Smith. Front row: Florence Davis. Sunflower, J. Shrimpton, Miss Anna Hartshorn, Chas. Davis, and L'Enfant des Mondes (splendid). The second honours went to Mr. J. Trelford, gardener to C. Gatehouse, Esq., Noctorum. Mr. J. Williams, gardener to C. J. Proctor, Esq., Noctorum, was third with a stand of bright coloured smaller For twelve Japanese Mr. H. Howard, gardener to A. S. Mather, Esq., Beechwood, Woolton, put up a splendid stand, the best being Chas. Davis, Marie Hoste, W. H. Lincoln, and Col. Smith. Mr. J. Pink, gardener to J. T Sealby, Esq., was a very fair second. For eighteen incurved Mr. T. Ransom was the only exhibitor, but his stand was well worthy the first prize awarded. Very fine indeed were his blooms of Robert Cannell, Emily Dale, Mons. R. Bahuant, Jeanne d'Arc, Prince Alfred, Mrs. Coleman, and Princess Beatrice. For twelve incurved Mr. H. Howard showed in fine form Mons. R. Bahuant, Emily Dale, Baron Hirsch, Violet Tomlin, Mrs. Coleman, and Jeanne d'Arc. Mr. J. Trelford was second, and Mr. J. Williams third. In the local class for twelve Japanese Mr. Ransom repeated his successes; Mr. J. Pink was second, Mr. J. Williams third. The same exhibitor was again first in the class for twelve incurved. For six Japanese Mr. J. Bradshaw, gardener to C. W. Pitt Taylor, Rock Ferry, put up special stand. Mr. W. Thomas, gardener to G. E. Grayson, Esq., was first for six incurved Lord Wolseley. For six incurved and six Japanese, open to those who employ one gardener, the prizes were taken respectively by Messrs. Jos. Hay, gardener to E. C. Thin, Esq., Oxton, and Mrs. Leete, Oxton, Messrs. R. R. and J. H. Anderson taking honours for six blooms in the class for those who do not employ a gardener. In the class for those who have never won a prize at the show Mr. J. Cubbon, gardener to

G. E. Moses, Esq., Higher Bebington, had a good stand, and Mr. H. Holford, gardener to C. MacIver, Esq., Heswall, coming in second.

The groups were much superior to those seen at Liverpool on the

The groups were much superior to those seen at Liverpool on the previous Tuesday. The leading honours went to Mr. A. Price, gardener to F. Jevons, Esq., Claughton; Mr. A. Brown, gardener to Geo. Webster, Esq., Upton, being placed second. For three vascs of Chrysanthemums arranged for effect Mr. J. Williams had no difficulty in securing the award. Primulas and Cyclamen were good, as were also Mignonette and table plants, the prizes going respectively to Mr. J. W. Totty, gardener to W. Laird, Esq., Birkenhead; Mr. W. Thomas, Mr. A. Price, Rev. Canon Robin, and Mr. A. Brown. Bouquets did not call for special comment, being much under the average in every instance as regards arrangement and colouring.

Fruit and vegetables were grand, the black Grapes being in every way superior to those at Liverpool. Awards of merit were granted to Messrs. Dickson, Limited, Chester, who had a table containing a general collection of fruit gathered from young trees in the nurseries, very attractive. Also to Mr. Henderson, Oxton Hill, Birkenhcad, for plants and blooms; and to Mr. Bradshaw for miscellaneous plants.

GLOUCESTER .- NOVEMBER 9TH AND 10TH.

This annual Show was again held in the Corn Exchange, and was a decided improvement on the past few years. Mr. J. Aplin, gardener to W. M. Baker, Esq., was the most successful exhibitor of Chrysanthemums, taking first honours for a well-arranged group of healthy well bloomed plants, and also premier honours for forty-eight cut blooms, thirty-six Japanese and twelve incurved, thus repeating his Bath successes of the previous day. The back row was composed as follows:—W. Tricker, W. H. Lincoln, W. Seward, Gloriosum, Mdlle. M. Hoste, Viviand Morel, Edwin Molyneux, Avalanche, Perfet Robert, Stanstead White, W. G. Drover, W. Woodcock. Second row: Colonel W. B. Smith, Excelsior, Geo. Atkinson, Charles Davis, Etoile de Lyon, Sunflower, White Louis Boehmer, Baronne de Prailly, Mrs. C. Wheeler, Amos Perry, Gambetta, Mrs. A. H. Neve. Front row: Mrs. J. Laing, Comte de Germiny, John Dyer, Ruth Cleveland, Fimbriatum Japonaise, Thunberg, Stanstead Surprise, Mrs. W. Clarke, Eynsford White, Florence Davis, B. D. Crane. Incurved: Lord Wolseley, Queen of England, Lady Dorothy, Empress of India, Miss Haggas, Prince Alfred, Jeanne d'Arc, Violet Tomlin, Beauty, Mr. Bunn, and Flora Macdonald. Mr. Wheeler, Blackmore Park, was a fair second.

Fruit is always well shown at Gloucester, and this year the entries were extra numerous. Mr. J. Watkins, Pomona Nurseries, Hereford, practically swept the deck with Apples and Pears, taking first position in the following classes. Collection of culinary Apples, seventy dishes; collection of desert Apples, sixty dishes; collection of Pears, and in the following single-dish classes: Ribston Pippin, Blenheim Orange, immense fruits, and Dumelow's Seedling. The English Fruit and Rose Company, King's Acre, Hereford, were very close to Mr. Watkins in collections of dessert and culinary Apples, taking second honours in each case. The same Company took first position for any variety of desert Apple with Scarlet Nonpareil, first for Ashmead's Kernel Improved, and first for the best dish of culinary Apples with a grand dish named Byford Wonder. The first staged by the above exhibitor was very fine indeed.

For the best collection of dessert and culinary Apples, twenty-four dishes, prize given by Mr. J. Watkins, C. Lee Campbell, Esq. (gardener, Mr. S. T. Wright), was a good first with a large, highly coloured fruit. Mr. J. R. Bennett, Chaxhill House, Newnham, was second, who also staged well. Mr. Watkins was an easy first for a collection of cider Apples with fruit of a lovely colour. With white Grapes Mrs. Gambier Parry, Highnam Court (gardener, Mr. Sowray), was first with good bunches of Muscat of Alexandria, and a similar position for black with beautiful Alicante. Mr. J. H. Jones, Churchdown, was second with the same variety, badly coloured, while some well-finished Gros Guillame and West's St. Peter's were left out, a decision which caused a good deal of comment. The same applies to the first prize awarded in the Cox's Orange Apple class, in this case the dish taking premier honours was not Cox's Orange Pippin at all. Vegetables, grain, and roots (agricultural) were largely exhibited, and generally of high quality.—VISITOR.

LEATHERHEAD.—NOVEMBER 10TH.

THE ninth annual Chrysanthcmum Show of the Leatherhead Horticultural Society was held in the Institute of that town on the above date, when a bright and beautiful display of flowers was brought together. The quality of the flowers and plants was as a rule high, more especially in the classes devoted to the Japanese section. The incurved blooms, too, were fine, and reflected high credit on the growers. The arrangements of the Show, under the supervision of Mr. Pennington, the Secretary, and a Show Committee, were admirably carried out.

For a group of Chrysanthemums to be arranged in a space not exceeding 40 square feet, Mr. G. Mileham, gardener to A. T. Miller, Esq., was a very good first. The plants were carrying clean, shapely flowers, and were effectively arranged. Mr. Buck, gardener to W. Maples, Esq., Ashtead, was second. The blooms in this exhibit were of high quality, but the plants were not so well arranged as those of the first group. The third prize was accorded to Mr. F. Hodgson, gardener to H. White, Esq. Mr. Mileham was first for six distinct large-flowering varieties in pots with good plants. Mr. Long, gardener to J. F. Chance, Esq., was placed second. For three plants Mr. Mileham was again first with finely flowered plants. The same exhibitor was also awarded

the first prize for a specimen Pompon, Mr. Mease, gardener to A. Tate, Esq., being a good second, and Mr. Buck, gardener to W. Maples, Esq., third. Mr. Mileham won easily with three grandly flowered specimen Pompons. In the class for twenty-four blooms, twelve Japanese and twelve incurved, distinct, Mr. Mease was a splendid first, staging—back row: Mrs. C. Harman Payne, Stanstead White, Eda Prasse, Col. W. B. Smith, John Lambert, Queen of England, E. B. Hithnall, Jeanne d'Arc. Middle row: Robert Owen, G. C. Schwabe, Excelsior, Charles Davis, Empress of India, John Doughty, Robinson King, Lord Alcester. Front row: Viviand Morel, J. Hanborough Dibben, Mdlle. Thérèse Rey, Etoile de Lyon, Mrs. S. Coleman, Empress Eugénie, Violet Tomlin, and Princess of Wales. The Japanese in this stand were heavy, superbly formed flowers, and the incurved were of fine size and perfect finish. Mr. Beckett, gardener to T. H. Bryant, Esq., Mickleham, was a good second, his Japs being especially noteworthy. The best were Viviand Morel, Jean Delaux, Marie Hoste, and Sunflower.

Mr. C. Beckett was first for twelve incurved, distinct, staging—back row: Marquis du Bois, Hero of Stoke Newington, John Lambert. Middle row: Lord Wolseley, Princess of Wales, Lord Alcester, Ami Hoste. Front row: Jeanne d'Arc, Madame Darrier, Baron Hirsch, and Miss M. A. Haggas, all the blooms being very fine. Mr. Mease was a very close second. For twelve Japanese Mr. Mease was first with a magnificent stand, consisting of—back row: Col. W. B. Smith, Etoile de Lyon, Edwin Molyneux, Mrs. C. Harman Payne. Middle row: H. Seward, V. P. Darquet, Mrs. Cannell, J. Stanborough Dibben. Front row: Mdlle. Thérèse Rey, Lord Brook, Mrs. Falconer Jameson, and Viviand Morel. Mr. C. Beckett was second with a highly creditable exhibit, amongst the best blooms in which were W. H. Lincoln, Marie Hoste, and Sunflower. For six Japanese Mr. G. Rowes, gardener to R. H. M. Praed, Esq., Mickleham Downs, who showed Etoile de Lyon, Col. W. B. Smith, Violet Rose, Viviand Morel, Lizzie Cartledge, and Condor, all in fine condition; Mr. Mileham being second; and Mr. Peter, gardener to H. P. Sturgis, Esq., Leatherhead, third. For six incurved Mr. Peter was first with Robt. Cannell, John Lambert, Princess Teck, Lord Alcester, Camille Flammarion, and Miss M. A. Haggas. Mr. Mileham was a good second. Mr. Peter was first for six reflexed with charming blooms, Mr. Mease being second.

Mr. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, staged a stand of Japanese and incurved not for competition. Both sections were represented by some beautiful examples. Mr. Page, gardener to A. Dixon, Esq., Cherkley Court, also showed a highly creditable stand. The double Primulas with which Mr. Mease gained the premier award were splendid examples of high culture, and proved conclusively to what perfection these plants may be brought in the hands of an intelligent man. Fruit and table plants were also largely shown, as also were Cyclamens and Bouvardias. The amateurs' classes were strongly

contested, many fine blooms and plants being staged.

HITCHIN.—NOVEMBER 10TH.

THE third annual autumn Exhibition of the Hitchin and District Horticultural Society was held in the Corn Exchange, Hitchin, on Friday last. As was general anticipated, the cut blooms formed a prominent feature of the Show, these being staged in excellent condition. Most of the classes were well filled, and in some of them the competition was very keen. Groups and trained plants, although not numerous, were fairly good, and, as will be seen by the remarks that follow, fruit and

vegetables were well represented.

One of the principal classes in the cut bloom section was for eighteen incurved. In this there were three entries, and the competition was exceedingly close. The first prize went to Mr. W. Collins, gardener to J. W. Carille, Esq., Ponsbourne Park, Hertford, who has a stand of neat and well finished blooms. These comprized Lord Alcester (grand), Robert Cannell, Mrs. Coleman, Alfred Salter, Queen of England (magnificent), Violet Tomlin, White Empress (good), Madame Darrier (fine), Mrs. Heale, Mrs. Robinson King, Alfred Salter, and Miss M. A. Haggas. Mr. J. Turk, gardener to P. Bosanquet, Esq., Poufield, Little Berkhampsted, was a good second. The best flowers in this stand were Lord Wolseley, John Doughty, Alfred Salter, Mrs. Coleman, and Jeanne d'Arc. Mr. E. Beckett, gardener to H. H. Gibbs, Esq., Aldenham House, Elstree, was third with a stand of neat blooms.

Mr. Ernest Cotton, gardener to A. W. Lines, Esq., Hitchin, secured the leading award for twelve incurved blooms, showing Violet Tomlin, John Lambert, Jeanne d'Arc, Madame Darrier, Novelty, Miss M. A. Haggas, Queen of England, Lord Wolseley, Barbara, Lord Alcester, John Salter, and Empress Eugénie. Mr. G. R. Allis, gardener to Major Shuttleworth, Old Warden Park, Biggleswade, was second, this exhibitor's best blooms being Prince of Wales, Pink Venus, John Salter, and Lord Wolseley. Mr. W. Collins gained the leading award in a class for six incurved blooms of one variety, showing Madame Darrier. The second prize went to Mr. E. Beckett for six fine blooms of Miss M. A. Haggas.

Mr. E. Cotton was third with Jeanne d'Arc.

The Japanese blooms were very good and formed quite a feature. Mr. E. Cotton won with twelve blooms, showing fine examples of Edwin Molyneux, A. H. Neve, W. Tricker, Etoile de Lyon, W. H. Lincoln, Eynesford White, Fair Maid of Guernsey, W. W. Coles, Louis Boehmer, Mrs. F. Jameson, Viviand Morel, and Sunflower. Mr. E. Orseman, gardener to G. Lucas. Esq., Hitchin, was second, W. H. Lincoln, Sunflower, and Val d'Andorre being especially good in this stand. Mr. J. R. Allis was third.

There were five exhibitors of stands of twenty-four Japanese blooms and the fight for supremacy was very keen. Mr. E. Beckett, however,

gained the first prize with a stand of well finished blooms. The varieties staged were Viviand Morel, J. P. Kendal, Violetta, Edwin Molyneux, Golden Wedding (grand), Excelsior, Mrs. C. H. Payne, Lord Brooke, Mrs. Watt's Cutting, G. W. Childs, Mdlle. Thérèse Rey, (splendid), Waban, Colonel W. B. Smith, Le Verseux, Mdlle. Marie Hoste, Etoile de Lyon, Mrs. F. Jameson, Val d'Andorrc, Puritan, Beauty of Castlewood, W. H. Lincoln, Silver King, Charles Davis (fine), and W. Tricker. Mr. W. Collins was a good second, the best flowers in this stand being Edwin Molyneux, W. H. Lincoln, Pearl Beauty, Mdlle. Marie Hoste, and Robert Owen, the last named being exceptionally good. Mr. J. Turk was third with a stand of excellent blooms. Mr. George Saunders, Gas House, Hitchin, secured first prizes for six Japanese blooms distinct, and for three Japs, and the same number of incurved blooms, also for six bunches of Chrysanthemums. Mr. W. Collins won in the class for six blooms of one coloured Japanese variety, staging fine blooms of Edwin Molyneux. Mr. E. Cotton was second with well grown Viviand Morel, and Mr. J. Kipling, gardener to J. C. Osgood, Esq., Knebworth House, Stevenage, third, with the same variety, staging Mdlle. Marie Hoste. Mr. W. Millard, gardener to W. Ramson, Esq., Fairfield, Hitchin, was second with six neat blooms of Mrs. Alpheus Hardy. Mr. J. Kipling third. Mr. E. Beckett was placed first with six Pompons, distinct, staging Cendrillon, Perles des Beautés, Black Douglas, Scapion, William Westlake, and Eynesford Gem. Mr. J. Turk was second, and Mr. E. Cotton third.

Trained plants were shown in good condition, if not very numerously. For six plants Mr. W. Springham, gardener to J. H. Tukes, Esq., was placed first. This exhibitor showed fine specimens of J. M. Pigny, Edwin Molyneux, Madame Bertie Rendatler, Margot, Elaine, and Sarah Owen. The plants were remarkably well flowered. Mr. E. Osman was second. Mr. Springham also had the best three plants in pots, showing Madame Baco, Cullingfordi, and W. H. Lincoln. Mr. W. Millard was second, and Mr. A. Wilson, gardener to A. Ransom, Esq., Benslow, Hitchin, third. Mr. E. Osman won with a group of Chrysanthemums, the plants being well grown and admirably arranged. Mr. W. P. Clark, 10, Fishpond Road, Hitchin, the Assistant Secretary of the Society, was second with a group that reflected great credit on the grower. Mr. J. Upchurch, gardener to F. Lucas, Esq., Hitchin, was third; and Mr. R. Sharp fourth.

The table decorations open to ladies were very good, Mrs. R. Shillitoe, Bancroft, Hitchin, was placed first, Mr. E. C. Foster, Bancroft, Hitchin, Miss Tindall Lucas, Foxholes, Hitchin, third, and Miss Mary Ransome fourth. Miss Tuke secured the leading award for a bouquet of autumn foliage, Miss Ellen Pollard second, and Miss A. Foster third. The same exhibitors secured prizes for bunches of Chrysanthemums.

Amongst the miscellaneous exhibits a group of Violets in pots and bunches of flowers shown by Mr. C. E. Martin, gardener to Viscount Hambledon, The Hoo, Welwyn, Herts. These were admirably grown and

loaded with bloom.

Fruit and vegetables were well shown. Mr. Beckett won with two bunches of white Grapes, staging good clusters of Muscat of Alexandria. Mr. R. Allis was second. Mr. A. Burgess, gardener to the Earl of Harkwicke, Wimpole Hall, Royston, was first with two bunches of black Grapes, staging well finished Alicante. Messrs. E. Beckett, G. R. Allis, and W. Millard followed. Culinary Apples were best staged by Mr. John Buckingham, Ickleford, Hitchin, who also won the first prize for one dish of Pears. Mr. C. E. Martin gained the first prize for five dishes of culinary Apples; and Mr. C. Welch, gardener to J. H. Tukes, Esq., Hitchin, was first with five dishes of dessert varieties. Mr. Burgess was first with three dishes of dessert Apples, Mr. Kipling following. Mr. J. Brandon was first with six Cyclamens; and Mr. E. Beckett followed. Mr. Springham had the best six Primulas; and Messrs. Brandon and W. Millard were second and third respectively.

WINDSOR.—November 10th.

THE second annual Exhibition of this Society was held in the Albert Institute and showed a marked improvement on the initial attempt last year there being a great increase of exhibits

Aftert Institute and showed a marked improvement on the initial attempt last year, there being a great increase of exhibits.

The principal class was that for a group arranged in semicircular form, quality and general effect to be the leading feature. No less than six competed, making a good display. Mr. J. Edge, gardener to Lord Harlech, Ascot, was an easy first with dwarf plants carrying good blooms, not too much crowded. Mr. H. Wood, gardener to Lord Boston, second, and Mr. F. H. Berry, gardener to Lady Mary Currie, third. Mr. W. Skeet, gardener to Sir H. D. Gooch, Bart., Windsor, was the only exhibitor of four specimens, but they were magnificent examples. Amateurs staged some well grown plants, T. Wyborr, Esq., Clifton House, Windsor, winning for twelve.

Cut blooms were the most important part of the Exhibition, so

Cut blooms were the most important part of the Exhibition, so numerously and well were they shown. The principal class in this section was for thirty-six distinct varietics, half to be incurved and the remainder Japanese, seven competed Mr. Thorne, gardener to Major Joicev, Sunningdale Park, Ascot, won the premier award by the superiority of his Japanese. The Japanese were Viviand Morel, E. Molyneux, Etoile de Lyon, W. H. Woodcock, M. E. A. Carrière, G. C. Schwabe, John Dyer (good), Excelsior, John Shrimpton (grand), W. H. Lincoln, Mrs. E. W. Clarke, Mdlle. M. Hoste, Florence Davis, Gloriosum, Mdlle. Thérèse Rey, M. Baco, G. W. Childs, and Col. B. Smith. Incurved—Queen of England, Camille Flammarion, Golden Queen of England, Lord Alcester, Brookleigh Gem, Empress of India, Miss M. A. Haggas, Madame Darrier, Willie, Prince Alfred, Lord Wolseley, Golden Empress, Princess Teck, Flora Macdonald, Lady

Dorothy, Princess Beatrice, Nil Desperandum, and Barbara. Mr. G. Lane, gardener to Miss A. S. Ridge, Ascot, second, and Mr. H. Popple, gardener to The Hon. Lady Cowell, Stepney, Ascot, third.

In the class for twenty-four incurved in not less than eighteen varieties Mr. J. Williams, gardener to F. Ricardo, Esq., Ascot, won the first prize with medium sized, neat blooms of leading varieties. Mr. Skeet was second. Mr. G. Lane won for twelve incurved with well finished examples; especially good were Miss M. A. Haggas, Violet Tomlin, Lucy Kendall, and Princess of Wales. Mr. G. Woodhouse, gardener to Miss Belcher, Windsor, was second. For six incurved, any one variety, Mr. Skeet with Mrs. Heales secured the premier award, Mr. J. Williams was second with Jeanne d'Arc, Mr. Lane third with Prince Alfred.

Japanese varieties were very good. For twenty-four in not less than eighteen varieties Mr. A. Sturt, gardener to N. L. Cohen, Esq., Ascot, secured the premier position with heavy, fresh blooms, admirably arranged. Mr. J. Williams was second, Mr. Skeet third, both staging well. For twelve varieties Mr. E. Johnson, gardener to A. Gilliat, Esq., Windsor, was an easy first with remarkably fine flowers; Mr. G. Lane second, and Mr. J. Cowie, gardener to B. L. Oliver, Esq., Ascot, third.

Anemone varieties were really well shown by Messrs. Sturt and Williams, the prizes going in the order here given. The same remark applies to the reflexed section, no less than six lots of twelve being staged. Mr. Popple was first with blooms not extra large, but full and highly coloured; Mr. Thorne second, and Mr. Woodhouse third.

EXETER.—November 10th.

THE Devon and Exeter Horticultural Society's Chrysanthemum Show was held in the Victoria Hall, of the above named city, on Friday last, and in every way proved a decided success. The exhibits were so numerous that an extra room had to be requisitioned to accommodate much of the fruit and some trade displays. Groups of Chrysanthemums, arranged with Palms and other foliage plants, had a most pleasing effect, and the cut blooms, especially of Japanese, were remarkably good, and the competition in most instances very keen. The Show was the best the Society has yet held, and, favoured by beautiful weather, was

largely patronised.

In the cut bloom section the leading class was that for thirty-six Japanese; six good stands were staged in competition, a silver cup value 5 guincas, being offered as the first prize. The collections staged by Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Torquay, and Mr. Hawkins, gardener to W. H. Fowler, Esq., Taunton, were very close in merit. The blooms of the latter, although good, lacked freshness, and had to take second place. The first prize stand consisted of the following, reading from left to right:—Back row: Etoile de Lyon, Golden Wedding, Viviand Morel, Sunflower, Dorothea Shea, Princess May, Silver King, W. H. Lincoln, Mrs. F. Jameson, Boule d'Or, Mrs. C. H. Wheeler, Mrs. E. D. Adams. Middle row: Col. W. B. Smith, E. Molyneux, Robt. Owen (good), Alberic Lunden, Stanstead White, Vice-President Audiguier, Wm. Lane, Mdlle. Marie Hoste, Lizzie Cartledge, Florence Davis, Ruth Cleveland, Gloire du Rocher. Front row: G. C. Schwabe, Beauty of Exmouth, Excelsior, Mr. Broomhead, W. K. Woodcock, Charles Blick, Violet Rose, Mrs. L. Allen, Mr. A. H. Neve, Puritan, J. Stanborough Dibben, and Madame Baco. Mr. Fowler had some magnificent blooms in his second prize stand. Third, Mr. J. Lloyd, gardener to Vincent Stuckey, Esq. With eighteen varieties, J. Lloyd, gardener to Vincent Stuckey, Esq. With eighteen varieties, distinct, the latter exhibitor was placed first, having good blooms; Mr. Foster was second; and Mr. Thomas, gardener to Wilfred Marshall, Esq., Taunton, third.

For twelve Japanese eight competitors staged, the best coming from Mr. W. H. Veale, gardener to the Rev. A. H. Sims. They comprised Viviand Morel, E. Molyneux, W. H. Lincoln, Mrs. H. Payne, Madame Baco, Sarah Owen, Mdlle. Marie Hoste, Lord Brooke (good), W. Tricker, Miss A. Hartzhorn, Gloire du Rocher, and Etoile de Lyon. Second, Mr. F. Dark, gardener to T. S. Philpot, Esq. In his stand was a magnificent bloom of Robert Owen, which was unanimously selected as the best Jap bloom in the Shelley was bloom in the Show. Mr. Mairs, gardener to Sir John Shelley, was third. Three classes were devoted to sixes of Japanese, one variety, white, yellow, and any other variety, a grand lot of flowers being staged. With white Mr. Fowler was first with Beauty of Exmouth; second, Mr. Veale with Florence Davis, larger flowers, but scarcely at their best. Six yellow.—First, Mr. Veale with extra fine W. H. Lincoln. Second, Mr. Foster with Golden Wedding, also good. For six of any other colour, Mr. Fowler came first with finely coloured E. Molyneux. Second, Mr. Stiles, gardener to Miss Fripp, Teignmouth, with monstrous blooms of

Viviand Morel, but rather pale.

The incurved blooms were not quite so numerous as the above. For twenty-four, distinct, Mr. Foster gained another first, having-back row: Alfred Salter, Golden Empress, J. Lambert, Miss Belle Wilson, Queen of England, Violet Tomlin, Lord Alcester. Middle row: Jardin des Plantes, Madame Darrier, Empress of India, Hero of Stoke Newington, Mrs. Robinson King, Lord Wolseley, Princess of Wales, Mrs. Mitchell. Front row: Camille Flammarion, Empress Eugénie, Lady Hardinge, Jeanne d'Arc, Prince Alfred, Miss Haggas, Baron Beust, and Princess Alice. Second, Mr. Lloyd. The competition was stronger in the class for twelve blooms. Mr. F. Prothero, gardener to W. McKenzie Bradley, Esq., coming in first. Second, Mr. Heath, gardener to Sir W. Walrond, in whose stand was a fine Jeanne d'Arc. Third, Mr. Veale. The best incurved bloom in the Show was a large and finely will Baron Hirosh. incurved bloom in the Show was a large and finely built Baron Hirsch in Mr. Stiles' third prize stand of twenty-four. The reflexed and

Pompons were not strongly represented, and call for no special com ment. Two exceedingly pretty stands of six varieties of single were shown in bunches of three. First, Mr. Prothero, with Souveair de Londres, Admiral Symonds, Calliope, Mrs. Killock, Tisiphone, and Snowflake. Second, Mr. Emmett.

At Exeter the schedule stipulates that a Palm shall be used for the centre of each group (the groups are all circular), and Ferns may be used to finish off the base, which has a good effect. A class is also provided in which Chrysanthemums and foliage plants intermixed shall form the groups. Four competitors entered in each class, Mr. Rowland, gardener to W. Brock, Esq., Exeter, winning easily in each instance. Second, Mr. Rogers, gardener to G. Randall Johnson, Esq. Third, Mr. Higginson, gardener to Mark Farrant, Esq. Mr. Rowlands' other group was a very clegant arrangement. Second, Mr. A. Williams, gardener to W. C. Sim, Esq. Mr. Rowland was also first for a miscellaneous group of plants, Chrysanthemums excluded; second, Mr. Williams.

There was a wonderful display of Apples and Pears, the colour of the former being remarkably bright. Forty classes were provided for these, the competitors in most instances being numerous. The principal prizetakers were the gardeners (whose names we failed to obtain) to the following gentlemen—Sir J. Amory, Sir'J. D. Ferguson Davie, Lord Poltimore, Sir J. Copp, Major Tracey, Sir T. Acland, Sir W. Walrond, W. C. Sim, Esq., and Mr. Whitehead.

Miscellancous exhibits were largely contributed by Messrs. Robt. groups. Four competitors entered in each class, Mr. Rowland, gardener

Miscellancous exhibits were largely contributed by Messrs. Robt. Veitch & Son, Exeter; the Exeter Nursery Co., Exeter; Mr. Jarman, Chard; Mr. Godfrey, Exmouth, ten stands of Chrysanthemum blooms; and Mr. G. C. Sclater, Heavitree Nursery, Exeter.

TADCASTER PAXTON SOCIETY .- NOVEMBER 10TH.

On Friday last the above Society held its second annual Chrysanthemum Show, which was opened by H. H. Riley-Smith, Esq., in the Town Hall, and was largely attended. The Show was a decided improvement on last year, especially in the cottagers' classes, where some fine collections of vegetables were staged. The entries in the gardeners' class were very poor. Three groups were arranged, not for competition, by T. Fielden, Esq., Grimston Park; H. Bromet, Esq., Tadcaster, and Miss Bethell, Newton Kyme. The Chrysanthemums in the amateurs' classes were highly creditable. An award of merit was given to Mr. Grix, gardener to J. M. Dawson, Esq., Wighill, for a handsome "sport" from Mrs. Shipman, also to Mr. William Green of Garforth Nurseries, near Leeds, for a fine display of home grown fruit.

BRADFORD AND DISTRICT .- NOVEMBER 10TH AND 11TH.

THE seventh annual Exhibition of Chrysanthemums under the auspices of the above Society was held in the Technical College, Bradford. The entries numbered nearly 300, against about 200 last year.

A splendid group (not for competition) of very choice Orchids was arranged in front of the orchestra by Messrs. Charlesworth, Shuttleworth, & Co., of Heaton, which was one of the main features of the Exhibition, and a certificate of merit was awarded. Mr. Bell, gardener to J. H. Rand, Esq., Baildon, exhibited a small but very neat group of Palms and other plants, for which a certificate was also awarded.

In the cut flower department, open class for twenty-four Japanese in not less than eighteen varieties, Mr. C. J. Ormerod was placed first, the Earl of Harrington second, and Mr. John Edwards third. twenty-four incurved blooms, in not less than eighteen varieties, Mrs.

Cope, Dove Park, Woolton, was first, the Earl of Harrington second and Mr. Adolph Jacobs, Cragg Royd, Rawdon, third.

In the amateur classes Mr. Ben Baxter, Lidget Green, Great Horton, took nine first prizes, five second prizes, and one third prize, as well as a silver medal. Mr. Jesse Hall, Shipley, and Mr. John Whittingham, Shipley, also secured many prizes. In the open and local classes, Mr. T. Newbould, gardener to Adolph Jacobs, Esq., Cragg Royd, Rawdon, was very successful, taking six firsts, three seconds, and one third prizes. In the local classes Messrs. H. Clark & Son, Rodley, did very well, taking three firsts, four seconds, and two third prizes. Mr. Lindsay, Stockfield-on-Tyne, and Mr. Jellicoe, Liverpool, officiated as Judges.

The silver cup. valued £5 5s., given by the Mayor of Bradford for the best group of Chrysanthemums, was won by Mr. Sam Dean, Great

Horton.

PONTEFRACT .- NOVEMBER 10TH AND 11TH.

THE seventh annual Show was held in the Town Hall, and although the exhibits were of good quality generally the classes were not so well filled as in previous years. Cut flowers were well shown, the principal class being for twenty-four blooms, twelve incurved and twelve Japanese, the first place being secured by Mr. Ketchell, gardener to C. H. Simpson, Esq., Moor Top, Ackworth. His incurved were rather small but of high finish; they included Jeanne d'Arc (2), Mons. Bahwant (2), Lord Wolseley, Camille Flammarion, Mr. Bunn, Madame Darrier, and Hero of Stoke Newington (premier bloom). The Japanese were very fine, particularly Eva Knowles (new, and for which a first-class certificate was awarded), Viviand Morel, Colonel W. B. Smith, Gloire du Rocher, G. C. Schwabe, W. Tricker, Alberic Lunden, and E. Molyneux. Mr. Groom, gardener to T. Tew, Esq., Carlton Grange, was a good second. His Japanese were better than in the winning stand, but the incurved were rougher. He had grand blooms of J. Shrimpton, W. Seward, W. Tricker, and G. C. Schwabe. Mr. Dunn, gardener to Mrs. D. L. Jones, Elmsall Lodge, Pontefract, was third. The premier Lapanese bloom was a splendid Viviand Morel in Mr. Findlay's stand. Mrs. D. L. Jones, Elmsall Lodge, Pontefract, was third. The premi-Japanese bloom was a splendid Viviand Morel, in Mr. Findlay's stand.

For twelve incurved blooms Mr. Ketchell was again first for neat

flowers similar to his other stand. Second, Mr. Groom. Third, Mr. Pearson, Knottingley. For twelve Japanese Mr. Groom was first with fine blooms. Second, Mr. Ketchell; and third, Mr. Findley, gardener to R. H. Jones, Esq., Badsworth Hall, Pontefract,

The only group which was highly creditable was from Mr. Bell, gardener to Jno. Rhodes, Esq., Snydalc Hall, Pontefract, who was given first place. Trained plants were not well represented, but table plants

first place. Trained plants were not well represented, but table plants

and Primulas were fine.

Fruit was well shown, notably Apples and Pears, also excellent Grapes, the principal winners being Messrs. Ketchell, Findley, Hirst, and Shaw. Vegetables made a fine display both in the local and cottagers' classes. Nurserymen's classes were represented by two fine tables from Mr. J. Sunley, Monk Fryston Nursery, and Mr. Lamprey of Ackworth.

LEICESTER.—NOVEMBER 10TH AND 11TH.

THE seventh annual Show of the Lcicester and Midland Chrysanthemum Society was held in the Floral Hall, Leicester, on the above

dates. The cut flowers were very good indeed.

dates. The cut flowers were very good indeed.

In the class for eighteen incurves, in not less than fifteen varieties, Mr. J. Underwood, gardener to R. Walker, Esq., was well first with Empress of India, Alfred Salter, J. Lamoert, Mons. R. Babuant, Lord Alcester, Queen of England, Lord Wolseley (2), Miss Haggas, Princess of Wales, Madame Darrier, Prince Alfred, Alfred Lyne, F. McDonald, Refulgens, Mrs. Coleman, Jeanne d'Arc, and Madame Darrier, The same exhibitor was also first for eighteen Japanese, distinct, with, amongst others, very fine blooms of Condor, W. W. Coles, Mrs. W. E. Clarke, Florence Davis, Mrs. F. Jameson, and Mdlle. Marie Hoste, Mr, Underwood was likewise first in each of the classes for twelve incurved and twelve Japanese, distinct. W. Bolton, gardener to — Billson, Esq., and twelve Japanese, distinct. W. Bolton, gardener to — Billson, Esq., was second for eightcen incurves, for eighteen Japanese, and for twelve Japanese. For twelve incurved the second prize was taken by H. Dunkley, gardener to S. Symington, Esq., Market Harborough, For six Japanese, of one variety, Mr. Underwood was first with superb Sunflowers, Mr. H, Rogers coming very close to him with six very fine Viviand Morels.

Four groups of Chrysanthemums and foliage plants were shown. Mr. H. Rogers, Gipsy Lane Nurseries, Leicester, was first with a charming arrangement. Mr. J. Smith, Vicarage Lane Nurseries, Belgrave,

also had a very pleasing group, not for competition.

Fruit was extensively shown, and in splendid condition. Mr. G. Boyes, florist and fruiterer, filled two large tables with collections of about seventy varieties Leiccstershire grown Apples. The other exhibitors of collections of very fine home grown fruit were Mrs. G. H. Ellis, Knighton Hayes, and Jas. Ellis, Esq., The Gynsils, Leicester.

The classes for bouquets of dried flowers brought a remarkable dis-

play, which proved one of the most attractive features of the Show. Some beautiful wreaths were also shown, not for competition, by Mr. H. Rogers and Mr. W. K. Woodcock, Barkley Road Nurseries. Messrs. T. Harrison & Sons, the Midland Seed Warehouses, were also well represented.

GODALMING .- NOVEMBER 10TH AND 11TH.

THE tenth Exhibition of the Godalming and District Chrysanthemum Society was held in the Public Hall on the 10th and 11th inst. and must be classed as one of the best the Society has yet held. Taken as a whole the exhibits were of a high order, especially the large trained specimens, Mr. H. Paddon carrying all before him in this class.

In the class for a group quality and effect being the leading feature, Mr. Tyler, gardener to — Hitchings, Esq., Monk's Hatch, won with a high class exhibit admirably arranged. Mr. Neal, gardener to H. Wyatt, Shackleford House, was a close second. Mr. King, gardener to Grahame Cooper, Esq., was third with very dwarf plants, good quality, but arranged somewhat too flat for effect. For three plants not disbudded the prize went to Mr. F. Jordan, gardener to Birket Foster, Esq., The Hill, Witley.

For eighteen cut blooms (incurved) Mr. Paddon, gardener to — Ricardo, Esq., Bramley, was again to the front. For twelve incurved the awards were:—First, Mr. Neal; second, Mr. Clarke; third, Mr. R. Jordan. Mr. Baker, gardener to W. Webb, Esq., was a good first for eighteen Japanese, closely followed by Mr. Paddon and Mr. Neal had a very fine board of the Rundle family, Ir. Clarke.

Mr. Jordan being second, and Mr. Jordan third.

In the class for six table plants Mr. F. Jordan was first with clean handsome specimens, Mr. Jordan second, Mr. Lampard third. For six distinct dishes of fruit Mr. R. Jordan led the way; for two bunches of white Grapes, Mr. Baker was first with well finished Muscat of Alexandra, Mr. R. Jordan being second with the same variety. In the other fruit classes Messrs. Paddon, Jordon, Tyler, Burfoot, Clarke, and Sutton secured the prizes.

In the class for miscellaneous groups a good competition resulted in Mr. Mitchell, of the Mead Row Nurseries, Godalming, being first with a very fine arrangement. Mr. Burfoot was a good second, and Mr. Butler was third. Table decorations and cottagers' exhibits were good.

IPSWICH.—NOVEMBER 14TH AND 15TH.

THE growing popularity of the autumn queen in East Anglia was clearly evinced on the occasion of the annual autumn Show, which opened on Tucsday in the Public Hall. The varieties were more numerous than ever, while the excellent quality displayed was sufficient evidence the eastern men know how to grow Chrysanthemums as well as Roses. The halls were filled to overflowing, and the vegetable exhibits

had to be accommodated in the corridors. The Executive Committee arc to be congratulated on the excellent arrangement of the Hall. The groups were numerous and meritorious, Mr. W. Pooley, gardener to G. R. Turner, Esq., gaining the first position with well grown plants. Mr. G. Howlett, gardener to Dr. Casley, was second; and Mr. Rolfe, gardener to P. S. Bruff, Esq., third. The groups of miscellaneous plants arranged for effect added considerably to the beauty of the Show. Mr. Chenery, gardener to Dr. Adams, had a very light arrangement, the Poinsettias, Crotons, and Ericas being the chief feature. Mr. G. Gilbert, nurseryman, was second with a bright display. Third, Mr. A. Soman, gardener to General Hessey, Melton.

The competition in the class for twenty-four Japs, distinct, was very keenly contested. Finally Mr. A. Bishop, gardener to R. Burrel, Esq., Westley House, was placed first; his best flowers were Viviand Morel, W. H. Lincoln, Lilian B. Bird, Sunflower, and Volunteer. Second honours were awarded to Messrs. Saltmarsh & Son, Chelmsford. Third, Mr. R. C. Notcutt, Broughton Road Nursery. In the class for twelve Japs Messrs. Notcutt, Saltmarsh, and Bishop divided the honours in the order named. In the class for twelve incurves Messrs. Saltmarsh were first with good even flowers of Violet Tomlin, Barbara, Golden Empress, Lady Dorothy, and Hero of Stoke Newington. Mr. Notcutt was a good second, showing good heavy flowers of Lord Wolseley, Prince Alfred,

and Empress Eugénie.

The leading prize offered consisted of a silver cup, value £5 5s., for eighteen Japs and a like number of incurves. The contest was a keen one, and gave the Judges some difficulty to decide; ultimately it was secured by Mr. J. C. Sheddick, gardener to Hon. A. C. Fellows, M.P. secured by Mr. J. C. Sheddick, gardener to Hon. A. C. Fellows, M.P. The stand was strongest in incurves. His flowers were—Back row: Viviand Morel (2), Florence Davis, E. Molyneux, Mdlle. Marie Hoste, Edwin Molyneux. Middle row: Gloriosum, G. C. Schwabe, Etoile de Lyon, Gloire de Rocher, J. S. Dibben, and W. K. Woodcock. Front row: Mrs. E. W. Clarke, Avalanche, W. H. Lincoln, A. H. Neve, G. C. Schwabe, and Florence Davis. Incurves—Back row: Lord Alcester (grand), Queen of England, Lord Wolseley (2), Jeanne d'Arc, Alfred Salter Second row: Princess Teck Madame Darrier Jeanne d'Arc. Salter. Second row: Princess Teck, Madame Darrier, Jeanne d'Arc, Novelty, Mrs. Robinson King (good), and Empress Eugénie. Front row: Miss Haggas, Princess Teck, Madame Darrier, Mrs. Heale, Princess of Wales, and Lady Dorothy. The Rev. H. Berners was second (gardener, Mr. Jordan) with fine Japanese, but weak in the other section. Stanstead White, Etoile de Lyon, Boule d'Or, E. Molyneux, and Lord Brookc were the most notable flowers. Mr. G. Rogers, gardener to Lord Rendlesham, was third, showing in good form Viviand Morel, W. H. Lincoln, Colonel Smith, G. C. Schwabe, and Lord Brooke.

Six blooms of Japanese, one variety, made a fine display, Messrs. Saltmarsh proving invincible with Viviand Morel, Mr. Light following with E. Molyneux, while Mr. Bishop staged the third winner in Lilian B. Bird. The class for six incurved, one variety, contained Lord Alcester from Rev. Berners, Mrs. Dixon from Mr. Bishop, third Empress of India

from Messrs. Saltmarsh.

The display of fruit was excellent, Mr. G. Rogers securing first honours for six dishes; second, Mr. Andrews, gardener to Hon. W. Lowther; third, Mr. Messenger, gardener to C. H. Berners, Esq. For three bunches of Alicante, Mr. Thos. King was placed first, followed by Messrs. Andrews and Messenger. Other black Grapes, Mr. Messenger was first with Gros Colman, Mr. Jordan with Gros Maroc, and Mr. Andrews with Mrs. Pince. The classes for Apples and Pears formed quite an exhibition in themselves, but space forbids entering their good qualities here. The vegetables were also very numerous and

TWICKENHAM.—Nov. 14TH AND 15TH.

THE annual autumn Show of the Twickenham Horticultural Society was held in the Town Hall on the above dates. The display was a handsome one, somewhat marred, however, by a thick fog which hung persistently over the town. Groups were very fine indeed, but the Japanese section in the cut blooms was by far the best represented. Incurved flowers here, as elsewhere, lacked substance and finish. Fruit was finely staged, as also were vegetables, Orchids, Palms, and other plants. The greatest credit is due to Mr. J. J. G. Pugh, Hon. Secretary, and the Show Committee, for the excellent manner in which all arrangements were carried out.

In the class for a group arranged in a space not exceeding 50 square feet, Mr. J. Parsons, gardener to T. Twining, Esq., was placed first for an admirable collection. Both flowers and plants were splendid. Mr. Rickwood, gardener to Lady Freake, was a good second, lacking taste in arrangement; Mr. J. Simmons, gardener to W. Cunard, Esq., third; and Mr. Weaton, gardener to J. B. Hilditch, Esq., being third. In the class for six untrained plants distinct open to constant. In the class for six untrained plants, distinct, open to amateurs only, Mr. J. T. Attwood was a good first, Mr. J. Brill being second, and Mr. J. T. Hoar third. For twelve blooms in not less than three varieties, Mr. J. Brill was first, Mr. J. T. Hoar second, and Mr. J. H. Gilbert third. In the class for twenty-four blooms, twelve incurved and the remainder Japanese, distinct, Mr. E. Coombes, gardener to W. Furze, Esq., was first. Amongst the best of those staged were Sunflower, G. C. Schwabe, Viviand Morel, Colonel W. B. Smith, Miss M. A. Haggas, Violet Tomlin, Robert Cannell, and Empress Eugénie. The second prize went to Mr. Woodgate, gardener to Lady Wolverton, with a superb exhibit; and the third to Mr. Waite, gardener to Hon. W. P. Talbot. There were five competitors for twelve incurved, distinct. Mr. E. Coombs was an excellent first staging. Emily Dale Violet Temlin. Deignet Temlin. cellent first, staging Emily Dale, Violet Tomlin, Princess Teck, and others in grand form. Mr. Woodgate was a very close second, and Mr.

Waite third. The prizes in the class for twelve distinct Japanese were very keenly contested, Mr. Coombs again taking the premier position. Amongst the best of his flowers were Viviand Morel, William Seward, G. C. Schwabe, and W. H. Lincoln. Mr. J. Osman was a good second, and Mr. J. Wilkins, gardener to Mrs. Pearson, third.

Mr. Waite was first in the class for twelve Anemone varieties with a The best were Lady Margaret Jeanne Mantz, Fleur de Marie, fine stand. and J. Thorp, jun. Mr. Woodgate, was accorded the second prize.
Mr. Woodgate was a good first for twelve bunches of Pompons, staging highly creditable examples of Bob, Rosinante, Mrs. Bateman, and Mdlle. Elise Dordan amongst others. For six Japanese, one variety, Mr. T. Osman was first with magnificent examples of Sunflower. Mr. Waite second with Viviand Morel, and Mr. Woodgate third with Etoile de Lyon. In the class for six incurved, one variety, Mr. Waite was first with superb examples of Queen of England, Mr. Coombs second with John Salter, and Mr. T. Osman third with Jeanne d'Arc. In the class for six bunches of singles, in not less than three varieties, Mr. J. Parsons was a good first, Mr. J. Wilkins being second, and Mr. G. Woodgate third. For twelve incurved, distinct, Mr. W. Ludbrook was first, Mr. J. Parsons second, and Mr. J. Simmons third. In the class for twelve Japanese varieties, distinct, Mr. J. Simmons was a good first, Mr. W. Ludbrook second, and Mr. J. E. Burton, gardener to Sir E. J. D. Paul, third. Mr. H. G. Fordham, nurseryman, Twickenham, staged a charming group of plants, not for competition.

CROYDON.--NOVEMBER 14TH AND 15TH.

A VERY fine show was held in the Public Hall on the above dates. The groups, trained plants, and the cut blooms were arranged in the

large hall, and the fruit and vegetables in the smaller one.

In the open class for eighteen Japanese and eighteen incurved, distinct varieties, Mr. Shoesmith, gardener to M. Hodgson, Esq., Shirley, was first with grand blooms. Back row: Colonel W. B. Smith, Mrs. E. D. Adams, Etoile de Lyon, Stanstead White, Viviand Morel, E. Molyneux, John Lambert, Empress of India (the finest incurved in the Show), Alfred Salter, Golden Empress, Queen of England, and Jeanne d'Arc. Second row: Mrs. Harman Payne, Coronet, Florence Davis, C. Shrimpton, Mdlle. Marie Hoste, Waban, Miss Haggas, Violet Tomlin, Princess of Wales, Mrs. Coleman, Lord Wolseley, and Mrs. Heale. Front row: Mrs. F. Jameson, Madame Baco, Charles Blick, Lord Brooke, Madame J. Laing, Sunflower, Lady Dorothy, Empress Eugénie, Madame Darrier, Mons. Davis, Princess Teck, and J. Salter. Mr. Wyatt, gardener to James Perry, Esq., Caterham, was a good second. Mr. H. Alderman, gardener to G. Hatfield, Esq., Morden, third. In this stand was the best Japanese bloom, a grand one of Viviand Morel.

Mr. Shoesmith was first for six Japanese, one variety, showing Viviand Morel; Mr. Wyatt second. In the corresponding class for incurved the same exhibitors changed positions, Mr. Wyatt being first with Qucen of England. Mr. Shoesmith was defeated by T. Wickham Jones, Esq., South Norwood. In the class for eighteen Japanese Mr. J. Knapp, gardener to F. W. Anderson, Esq., obtained first for twelve bunches of

There were several good groups of Chrysanthemums edged with foliage plants. Mr. Carr, gardener to Mrs. Clarke, Croydon Lodge, was awarded first; his blooms were of fine quality, but the arrangement was scarcely so good as Mr. Padley's, Bramley Hill Nursery, who came in second. Mr. Carr was also first for six trained plants, large flowering, also for six trained Pompons. Mr. Cooper, Sydenham Road Nursery, was second in both classes.

In the local classes Messrs. D. Love, C. Perret, and F. J. Strover were awarded the prizes for groups. Mr. H. Shoesmith was first for twelve Japanese, also for the same number of incurved varieties. Mr. Wickham Jones was awarded first for six Japanese, distinct, also six of one variety, showing Viviand Morel in fine style. Mr. Carr had the best six large flowering Anemones, and Mr. J. Knapp the best Pompon Anemones. Amateurs and cottagers exhibited well in the classes provided for them.

In the special class for eighteen Japanese, distinct, Mr. Shoesmith was first, and also for the best Japanese bloom with foliage as grown, showing a grand E. Molyneux, and for incurved with Empress of India.

Fruit, vegetables, and table plants were well shown.

Among the exhibits not for competition was a fine collection of Apples from Messrs. G. Bunyard & Co., Maidstone, all highly coloured. Messrs. J. Cheal & Sons, Crawley, had Apples and Pears. Messrs. Laing & Sons, Forest Hill, exhibited a collection of Apples, also a group of Chrysanthemums and miscellaneous plants. Mr. W. Wells, Earlsof Chrysanthemums and miscellaneous plants. Mr. W. Wells, Earlswood, had several stands of cut blooms; and the Secretary, Mr. W. B. Beckett, contributed a creditable stand of blooms.

PLYMOUTH .-- NOVEMBER 14TH AND 15TH.

THE second autumn Exhibition held by the West of England Chrysanthemum Society took place in the Guildhall, and was a decided advance upon that of last year—not only in the quality of the cut blooms, but in the classes for groups. The Executive deserve every praise for the spirited policy adopted in offering such handsome prizes. Mr. C. Wilson and Mr. Damerell managed the Exhibition in a commendable manner.

The principal class was that for forty-eight in not less than thirty-six varieties, half to be incurved and the remainder Japanese. Prizes of £15, £10, £5, £2, and £1 were offered. There were four competitors so close in point of merit that considerable time was spent by the Judges in making their awards. The honours eventually fell to Mr. N.

Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Fareham, and Messrs. W. & G. Drover, Fareham. Mr. Molyneux beat his strong opponents by a very few points in both sections. The incurved were not large, but very solid and perfectly finished. The Japanese were not large, but very solid and perfectly finished. The Japanese were particularly bright and well staged. The names were—Incurved: Lord Alcester (2), Queen of England (2), Golden Queen of England (2), Empress India (2), Princess Teck (2), Robert Cannell, Beauty (2), Mrs. R. King, C. B. Whitnail, Miss M. A. Haggas, Nonpareil, Lord Eversley, Hero of Stoke Newington, Mrs. Mitchell, W. P. Louis Blancard, Barbara, Lady Dorothy and Princess of Wales. Japanese: Etoile de Lyon (2), Princess May (2), Vice-President Calvat (2), Charles Davis (2), Viviand Morel, G. C. Schwabe (2), Mrs. F. A. Spaulding, Florence Davis, Mrs. C. Wheeler, Lord Brooke, C. Shrimpton, Duchess of York, Mdlle. M. Hoste (2), P. C. Kingston, Vice-President Audiguier, Pelican, Lizzie Cartledge and Lilian Bird. The best blooms in Mr. Drover's stand were Lord Alcester, Emily Dale, Lord Dorothy Mr. Drover's stand were Lord Alcester, Emily Dale, Lord Dorothy (grand), Mrs. N. Davis, J. Doughty, Golden Emperor and Nil Desperandum in the incurved. Japanese Charles Davis, Mdl e. Therese Day, Mrs. E. D. Adams, and Lord Brooke. Mr. Foster, gardener to H. H. Spencer, Esq., Teignmouth, third, with perhaps some of the finest Japanese blooms in the Show, the incurved somewhat stale. Mr. Stiles, gardener to Miss Fripp, Teignmouth, fourth.

In the class for twenty-four incurved, Messrs. Drover turned the tables on Mr. N. Molyneux, winning by the small margin of one point. The blooms in both stands were not large, but remarkable for high finish and freshness. The best blooms in the winning stand were Golden Empress, Lord Alcester, Emily Dale, Lady Dorothy, Princess Teck, Mrs. Coleman, Lord Wolseley, and Alfred Salter. Hero of Stoke Newington and Beauty were especially noteworthy in the second prize stand.

In the class for twenty-four Japanese Mr. Stiles was distinctly ahead

of Mr. Foster with full heavy blooms, capitally staged, of Viviand Morel, Stanstead White, Mrs. F. A. Spaulding, M. Bernard, M. Baco, Violet Rose, Beauty of Castlewood, and C. Shrimpton. For twelve Japanese Mr. N. Molyneux won with full blooms; Princess May and Mdlle. M. Hoste were especially good. Mr. Veele cardener to the Roy. A. H. Hoste were especially good. Mr. Veale, gardener to the Rev. A. H. Simms, Newton Abbott, second. Florence Davis won for Mr. Veale the premier award in the class for six white, any one variety, Messrs. Drover second. For six Japanese, any one variety, Mr. Stiles won with Viviand Morel in faultless style; Etoile de Lyon second, belonging to Mr. Foster. For six Japanese, any two varieties, Mr. N. Molyneux won with Mdlle. M. Hoste and Etoile de Lyon; Messrs. Drover second, Mr. Stiles third. Anemone and reflexed varieties were fairly well shown.

Groups of Chrysanthemums were a distinct feature of the Show, no less than nine competing: The best came from Mr. T. F. Ussher, Connaught Avenue, Plymouth, an excellent display. Admiral Parker, Plymouth, a good second. His gardener also won the premier award for six specimens with fairly good plants. For a group of miscellaneous plants Mr. Amos Groombridge, Tothill Nurseries, Plymouth, was first; Mr. C. Watts second. Mr. Godfrey, Exmouth, staged new Chrysanthemums not for competition, and so did Messrs. Smaile, Torquay.

DEVIZES .- NOVEMBER 7TH.

A BAZAAR was held in conjunction with the Chrysanthemum Show and a very pretty and effective display resulted. What also proves most satisfactory is the fact that a very handsome balance invariably accrues, this being distributed in the way of charity to the poor during the ensuing winter. Mr. T. King has the sole management of the Chrysanthemum Show proper, and arrangements are very good.

Cut blooms are the great feature of the display, valuable prizes attracting noted growers from various parts of the country. For twenty-four incurved varieties, in not less than eighteen varieties, the premier award went to Mr. J. Inglefield, gardener to Sir J. Kelk, who had Emily Dale (3), Lord Wolseley, Lord Alcester, Golden Empress (3), Queen of England, Empress of India (2), John Doughty, Princess of Wales, Lucy Kendall, Prince Alfred, Jeanne d'Arc, Miss Haggas, Madame Darrier, Mrs. N. Davis, Nil Desperandum, Empress Eugénie, Mrs. Heale and Brookleigh Gem, a lore excellent condition. Messrs. Ward, G. Drover, Fareham, were a close second, being only about four points behind. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Reigate, was a creditable third, four others also competing. The last named took the lead with twelve incurved varieties, staging fairly good blooms of John Lambert, Empress of India, John Salter, Lord Alcester, Violet Tomlin, Mrs. Heale, Jardin des Plantes, Prince Alfred, Mrs. Coleman, Lord Wolseley, Golden Eagle, and Miss Haggas. Mr. W. Robinson, gardener to Lord Justice Lopes, Heywood Park, Westbury, was a close second, the third prize going to the veteran Mr. J. Baylis, Winterbourne. In another class for incurved varieties to be shown with 4 inches of clear stem and Chrysanthemum foliage allowed, Mr. Robinson was well first.

For twelve Japanese varieties the first prize was a silver cup, value 5 guineas, this being presented by the Mayor of Devizes, and was well won by Mr. C. J. Salter, who staged grand blooms of Edwin Molyneux, W. H. Lincoln, Col. W. B. Smith, Mrs. C. H. Payne, Viviard Morel, J. S. Schwabe, Condor, C. Shrimpton, Chas. Davis, Excelsior, Mdlle. Marie Hoste, and Lord Brooke. Mr. P. Mann, gardener to W. H. Laverton, Esq., Westbury, lost by two points. Mr. J. Inglefield was a highly creditable third, his blooms, though of great depth, lacking in breadth. Eight others competed. There was also good competition with Anemone-flowered varieties, and with these Mr. Salter was again first. Mr. W. Robinson was second, the third prize going to Mr. W. H. Clack. For reflexed varieties Mr. Robinson was first, having good massive blooms. Mr. C. J. Salter was second, and Mr. Clack third. No less than five competed with a group of Chrysanthemum plants to occupy a space 10 feet by 60 feet, and a very grand display was made, all being deemed worthy of prizes, and received them accordingly. Mr. W. H. Clack, gardener to Col. C. E. Colton, M.P., Roundway Park, Devizes, was first. Mr. W. Mantell, gardener to W. Brown, Esq., Pottering, was second with a very imposing group. The third prize went to Mr. G. Pymm, gardener to Mrs. Gouldsmith, Trowbridge; an extra prize going to Mr. Smart, gardener to T. Chandler, Esq.; and a fifth to Dr. Rayment, Pewsey. Other plants were shown well.

[We have been compelled to abridge the reports of many shows, and to omit some of which no notification was received either by advertisement or in the form of reporters' tickets.]

HARDY FRUIT GARDEN.

Strawberries.—Clear away all surplus plants from between the rows, at the same time forking up strong weeds, or, if the latter are only small, hoeing them down in dry weather will suffice. Runners attached either to old or young plants ought to be cut, and the largest of the old leaves if at all withered or shabby may with advantage be removed. Weedy, untidy, and crowded Strawberry beds are at this season very unsightly, besides being detrimental to the well-being of the future crop. A mulching of manure may advantageously be applied between the rows of old plants, but recently planted Strawberries on fairly rich ground will not need at present any stimulation from the surface.

Raspberries.—If not previously cut away the old bearing canes must now be removed, disposing the stout current year's canes evenly along the trellis if such be employed. Shorten them to about 5 feet in length. When grown in stools or clumps divide the canes equally into three portions. Shorten one portion to the height of the stake used, which may be 5 feet, the next to $3\frac{1}{2}$ feet, and the remaining one to 2 feet, so that a pyramidal form of growth may be obtained and the fruiting portions disposed more regularly than is usually the case when all the canes are pruned to one uniform height.

Planting Raspberries.—Raspberries may now be planted, digging or trenching the ground well to a depth of 2 feet, adding some partially decayed manure, which must be well incorporated with the soil. Raspberries enjoy a rich, deep, loamy soil, as may be evidenced in a few years by the length and strength of the canes produced. When planting in clumps the canes from each being tied to a single stake, 3 feet apart is a proper distance, but in lines, the canes being secured to wires 2 feet will suffice. Plant strong roots with stout canes and plenty of fibres. After planting mulch with manure, and shorten the canes to within a foot of the ground. Strong growths will issue next year, but no fruit will be had. It is better to sacrifice the first year's crop in order to obtain extra vigorous growth and establish the plants. This once obtained in rich soil will continue with annual mulchings in the autumn for the purpose of feeding, and a similar application of manure in the

Blackberries.—The cultivated forms of Blackberries produce fruit which is exceedingly useful in the autumn. They succeed well in gardens possessing a strong rich soil in a sheltered but open position. The Parsley-leaved and Wilson, jun., Blackberries are two of the best, the former doing well in cold late districts. The fruit is large, juicy, and black in colour. Their cultivation is simple, being chiefly on the same lines as Raspberries. They take rather longer to establish themselves, seldom being strong enough to fruit before the third season after planting, inasmuch as it is imperative for strong canes to be produced before the plants are allowed to bear.

Planting Blackberries.—Young plants, which are better than old ones, obtained and planted now, cutting them down close to the soil immediately after, or before growth commences in the spring, will grow freely next season. Select an open position sheltered from northerly or easterly winds. Trench the ground to a depth of $2\frac{1}{2}$ feet, thoroughly breaking up the subsoil, but not bringing it to the top. Enrich the whole bulk of soil with manure of a suitable character. If rather light, cow manure may be employed, but light shallow soils are not suitable for producing superior growth and abundant fruit. Heavy soil may be dressed with partially decayed horse manure, working it as well in through the bulk of material as possible.

Blackberry canes grow to a great length, therefore plant at a distance of 5 feet from each other in rows 8 to 10 feet asunder. A stout stake should be driven down opposite each plant, and another midway between the two, making them $2\frac{1}{2}$ feet apart. To strengthen them and hold them together cross and diagonal pieces may be secured upon them, and a trellis formed 6 to 8 feet high, to which the canes may be trained. Laterals issue from the canes in summer, flower, and produce fruit in immense clusters, which ripen at a time of the year when they prove especially welcome.

Pruning and Feeding.—As before mentioned the plants should be cut down closely immediately after planting, or at the latest before

growth commences in the spring. Shorten again the following autumn, encouraging the subsequent season's canes to grow vigorously, thinning them out early to four or five of the strongest. Thorough ripening will ensure fruitfulness. A good mulching of rich manure must be applied every autumn to enrich the soil. Liquid manure in the summer and at other times proves most beneficial to well established plants.

FRUIT FORCING.

Pines.—Young Stock.—Small houses, span or three-quarter spanroofed, are the most suitable for young plants, where, with proper
attention to ventilation and close proximity to the glass without touching it, they will make steady progress without being drawn and weakly,
as occurs when they are kept too close and warm, and a considerable
distance from the light. A temperature of 65° at night should not be
exceeded, and a mean between that and 55° at night, with 65° in the
daytime, will keep young stock in a healthy progressive condition,
admitting a little air at the top of the house at 65°, leaving it on all
day, but not to lower the temperature below that point. Keep the
bottom heat steady at 80°, avoiding anything approaching to a damp
atmosphere, but moderate humidity is necessary. Apply water only at
the roots when the plants become dry, and then give tepid weak liquid
manure. Allow the plants plenty of room. Suckers ready for starting
now may be kept until March, and if there is likely to be a scarcity of
these for starting at that time, any recently potted may be afforded
a light position in a moderately moist pit, with slight bottom heat, and
a temperature of 55° at night, keeping them rather dry at the roots.

In the fruiting department 65° will be ample at night, 5° lower in

In the fruiting department 65° will be ample at night, 5° lower in the morning in cold weather, 70° to 75° by day artificially, and 10° to 15° rise from sun heat. Take every opportunity of collecting leaves whilst dry, Oak and Beech being the best, and whenever a favourable opportunity offers push forward whatever may be necessary in the renewing or augmenting the fermenting beds.

Vines.—Earliest forced in Pots.—Those started early in the month will respond promptly to the call made upon them by the warmth at the roots and the moist genial atmosphere, and will soon be showing signs of growth, when the temperature may be slightly increased—55° minimum and 65° maximum from fire heat, with 10° more from sun heat, proportionately increasing the atmospheric moisture and keeping the soil healthfully moist. Ventilation will only require to be moderate, affording what is needed at the top of the house, or if side air be given it should be made to pass over the heated surface so as to become warmed, for cold currents of air are very pernicious.

Houses of Thin-skinned Grapes.—November weather, as a rule, is not forceweable to hanging Grapes often causing them to damp consider.

Houses of Thin-skinned Grapes.—November weather, as a rule, is not favourable to hanging Grapes, often causing them to damp considerably. Grapes have ripened well this season, the skins being thicker and the flesh firmer than usual, whilst the juices are particularly rich and sugary. Black Hamburgh and Foster's Seedling, ripe in August, are keeping wonderfully well, also Madresfield Court which keeps better than Hamburghs, but loses colour seriously. Black Hamburghs with the roots of the Vine entirely inside are shrivelling, whilst those with the roots outside are quite fresh. Vines ripening their crops in September are still in foliage, and will bear more moisture at the roots and in the atmosphere than those that have had the Grapes ripe since August. Slight heat in the pipes will be required almost constantly to maintain an equable temperature, but this must not be high or it will cause the berries to shrivel prematurely, ventilating freely and early in bright weather so as to prevent moisture being condensed on the berries. The outside borders are best protected from rains, as excessively moist borders affect the Grapes prejudicially, and inside borders should have sufficient moisture to prevent the soil cracking, and if covered with a little clean sweet straw the Grapes will keep better. Covering the border prevents its cracking, and keeps down moisture likely to arise and prove injurious to the Grapes.

Houses Cleared of Grapes.—Where the Vines are leafless and the Grapes cut, attend to the pruning and cleansing of the house. If the Vines have stout, short-jointed well-ripened wood, the bearing shoots (side growths or laterals as they are frequently termed) may be pruned to a couple of eyes. If, however, the base buds are small, and the Vines from similar buds in previous years have not given as large bunches as desired, the shoots may be left a little longer, taking care to secure a plump, round (not flat), well developed bud on stout, hard, thoroughly ripened wood for pruning to, as this class of buds are necessary to give close compact bunches of well set berries, with a stoutness of footstalk that does not fall an easy prey to shanking. Large flat buds on longjointed pithy wood generally throw out large uneven badly set bunches, with thin large flabby leaves on long-jointed wood, and these are incapable of elaborating the food and concentrating it in the buds at their base. Also avoid pointed buds, as they are not always productive of bunches, and those produced arc often so small and tendril-like, as to be scarcely worth allowing to remain for a crop. Wash the glass with clear water, the wood and ironwork with softsoap, water, and a brush. Remove the loose bark from the rods and spurs, but avoid close peeling and hard scraping. Wash the Vines with tepid softsoap water 3 ozs. to a gallon, using a brush with care and judgment, and follow if necessary with an insecticide. Clear away the mulching or loose surface soil down to the roots, and place on a couple of inches thickness of fresh turfy loam. Afterwards sprinkle over it 4 ozs. per square yard of a mixture composed of three parts bonemeal and two parts kainit, and this will be dissolved and washed down to the roots by the early watering. If the houses must be used for plants they should be kept cool, admitting air freely, and not exceeding 40° to 45° by artificial

means. Otherwise admit air freely in all but very frosty weather, a few degrees of frost not injuring the Vines, but insuring more complete rest.

Melons.—Where the latest fruit is beginning to net, and will be ripe some time next month, the plants need a genial atmosphere to secure the swelling of the fruit. Damp the paths in the morning and early afternoon, admitting a little air in the early part of the forenoon to insure the dissipation of moisture, and induce evaporation from the foliage and fruit. Keep the growths thin, yet allow a fair amount of foliage. Maintain the night temperature at 65°, 70° to 75° by day, advancing as much as possible by closing at midday from sun heat. Afford liquid manure about twice a week. The plants that set their fruit early in September from the July sowings should have all the air possibly admitable with maintaining a temperature of 70° to 75°, yet husbanding the sun heat without closing the house, withholding moisture from the atmosphere and water from the roots.

APIARIAN NOTES.

HINTS FOR THE SEASON—REPAIRING HIVES.

ALL empty hives should be stored in a thoroughly dry place, and when in condition, overhaul, clean, and repair all defects. Paint or tar, the latter being the most durable, but if it cannot be tolerated, creosote the wood, then varnish with stain according to the taste of the bee-keeper. After this is done fill the frames with foundation. When full sheets cannot be afforded use narrow guides 1 inch broad. If half sheets are employed the bees are liable to work out the space with drone comb. When thus finished close the hives, and then they are in readiness for swarms when the time of swarming comes.

STORMS AND WRAPPINGS.

All hives should be stood level on a small piece of slate. If a daub of tar is placed under each foot it will prevent decay. When not loaded with weights to prevent storms overturning them, an iron rod or wooden stake driven into the ground close to the hive, a cord or wire round the hive and tied to the stake, will prevent them being turned over by any gale. Wrappings should not be stored away damp. When the hives are thoroughly protected there is no better place to keep them than on the tenanted stocks. Crates and supers are also kept upon the hive during the whole year. All our hives being made to accommodate three stories, with sufficient space for crown packing for the winter, are replete, and in readiness at all times for immediate use.

MELTING COMBS.

After the honey has been taken from the combs, then the latter steeped in water, they should be melted at once, as when left lying about moths attack them, and soon render the whole waxless. I find no be ter plan than to put the combs in bags of cheese cloth and place them in a tin or copper of water one at a time; boil slowly for a few minutes, then press the bag with a piece of wood, and as the wax oozes out and rises skim it off, as too much boiling spoils it. When the wax is thoroughly softened and melted remove the bag to a wide cylinder of fine perforations connected with the honey presser, then bring the screw to bear upon Meanwhile, the boiler must have a fresh bag of combs, so that the work is constantly and expeditiously performed. As the wax is prevented from squirting by an outer tin cylinder, it runs into a spouted tin, connected with another vessel. The above plan is the most effectual of any I have ever tried in separating the wax from the dross. When it is all formed into cakes it is put in tin, and this placed inside another. When melted it is lifted from the fire and allowed to cool slowly, and then all sedi-The foregoing method is ment may be removed by scraping. applicable to large or small quantities.

BEES QUIESCENT.

Although pollen was carried in by our bees up till the last day of October, they will not try to fly much during the coming two months, so ought not to be disturbed in the slightest degree. At the end of that period they get more restless, and will fly out at a temperature which in November and December would not induce them to do, the reason being that at that time many young bees are being brought forward.

FOUL BROOD.

A correspondent signing himself "George" wishes to know how to cure foul brood, and to disinfect the hives. Foul brood is practically incurable for several reasons. By the time foul brood is detected it would not pay to put off time and be at any expense in attempting a cure, and even if arrested for the time being, it

would be sure to re-appear whenever warm weather came. I wish to emphasise this last statement because certain persons have asserted over and over again that warm weather is favourable for the suppression of foul brood, whereas it is the very opposite, as frequently proven by well managed experiments. Every beeas frequently proven by well managed experiments. keeper should endeavour to keep away foul brood by preventing all accumulation of moisture inside the hive. Hives painted outside causes the moisture to condense on the inside of single-cased hives absorbing much of it, and as the temperature rises it passes off in the form of vapour and condenses upon bees and combs, while the honey absorbs it, all which tends to cause disease. It is even worse in the case of double-cased hives, inasmuch as it causes them to decay in addition to the other injury. It is much safer to have the inside of hives painted, even with the outside done, as then the moisture runs down and out of the hive, at least all that is not absorbed by the floor, the most death-dealing thing to bees during the winter. A ventilating floor, whether the hive is painted or not, is a safety valve during the whole year. As foul brood is as easily incited by overheating as by dampness, both evils are overcome by employing a ventilated floor.

When foul brood is suspected make an examination, and if present it may be known by the clammy feel of the combs, offensive smell, and the sunken or concave perforated sealings of the brood cells, these last containing a tough, gluey, putrid mass of dead larvæ. Do not tamper with foul brood. The moment it is detected place the bees in an empty hive. Disinfect every hive or appliance each time the bees have been in contact with them. Subjecting these things to the fumes of sulphur or charcoal, then washing thoroughly with lime and carbolic acid perhaps cannot be excelled, but as prevention is better than cure,

use the hives I have advised.

EARWIGS AND BEES.

On page 402 Mr. J. R. S. Clifford asks gardeners to report on what they know about earwigs. I am not a naturalist enough to give a full and reliable description on the habits of earwigs, but I

can in some measure answer the questions put.

Earwigs are gregarious, congregating in great numbers in sheltered places such as under bark of trees, whether on living trees or when in heaps. During the winter they take up their quarters under different material near the ground. In the spring and early summer I have frequently observed amongst colonies of these large white ones. What are they? Many years since, thinking they robbed bees of their honey, I had my bee house made clear of the ground, supported at the corners by blocks, which stood in basins of tar. Imagine my surprise when I went out after dark with a lantern to see the outside of the house swarming with them, where they could not reach unless they had flown.

Several times I have observed earwigs killing bees by catching them in their forceps; but, on the other hand, I have as often observed bees kill earwigs. I am inclined to think earwigs congregate about hives for warmth, that they naturally are afraid of bees, although they eat dead ones and the larvæ of moths and other enemies of the garden, being more the friends of the gardener

than his enemy.—A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Growing Strawberries on a Small Scale for Profit (A. H. E.). — By hiring a little ground, growing, and sending the fruit to a London salesman you would only be able to do so profitably by getting the fruit early or late, as in the height of the season small consignments, unless of great excellence, hardly pay expenses of gathering, packing, carriage, toll, and salesman's commission. Large, high-

coloured, even-sampled, first-class fruits only command remunerative prices, and these you are more likely to obtain in your immediate locality than by sending the produce to the London markets.

Cunila Mariana (A. F. G.).—The term Dittany is applied to several different plants. For example, the Dictamnus Fraxinella is so named, as also are two species of Origanum, while Cunila Mariana is known in North America as the common Dittany. Possibly these names have arisen from some fancied resemblance between the plants so designated; but to say the least the similarity of the Cunila to the

Dictamnus is by no means strongly marked. Cunila Mariana, of which an illustration is given in fig. 66, is a tufted dwarf hardy perennial plant included in the Mint family, and related to the Monardas and Salvias, though differing materially in general appearance. The plant rarely exceeds a foot in height, and produces its small rosy purple two-lipped flowers in great profusion, in dense corymbose or cymose clusters. According to Gray this Cunila is found in the dry hills south of New York; in England it thrives in any ordinary soil not too wet, and flowers in late summer.

Making Blood Manure (J. II. W.).—It is useless attempting to dissolve the protosulphate of iron in muriatic acid in the proportion given in the recipe, and it is quite unnecessary to do so. The protosulphate ought to be in powder and mixed with the muriatic acid before the liquid is poured on the blood, which must be rancid or smell strongly, and then it will be converted into a paste and ultimately powder. In that state it is a handy manure. As to its value as a fertiliser compared with blood manure formed by mixing wood ashes with blood we prefer the latter on account of the potash and other salts the wood ashes contain, and as a general fertiliser it is perhaps unexcelled. The other method may be handier for those requiring small quantities of manure for their potted and other plants. But there is nothing better for encouraging growth and sustaining crops of flowers or fruit than blood formed into a paste with dry ashes from twigs, dried, and reduced to a fine powder.

Diseased Pears (J. F. E. and Amateur).—The skin of the fruit in each case is disfigured by several depressed spots or scabs, and around these there is a whitish margin with a dark border permeated by mycelium, from which a few narrowly ovate bodies spring (stroma) contracted in places, and these cells breaking off act as conidia or spores. It is the condition of the fungus, Cladosporium dendriticum pyrinum, called Spilocœa pomi, Fries. The fruit seems to have been attacked by the fungus and then arrested, probably by the unusual hot weather, so that the growth of the Pears was irregular and swollen in places. The fungus develops on the fruit (even after it is gathered and stored) when the conditions are favourable, and greatly diminishes its using value. All affected fruit should be destroyed by burning, as it is unsightly and not perhaps wholesome. It is advised to lift the trees if not too large and give them some good fresh loam, or otherwise afford support. This tends to a better growth in the trees and assists them to resist the

disease. The trees should also be sprayed with sulphate of copper, 1 lb. to 25 gallons of water, when the buds commence swelling with a view to destroying the spores of the fungus, and they should be sprayed again as soon as the fruit is set with Bordeaux mixture, made as follows:—dissolve 4 oz. of sulphate of copper in a vessel by itself in 2 or 3 gallons of water, slake 4 ozs. quicklime (light lumps) in another vessel and form into a thin whitewash, then pour this through a hair sieve slowly into the vessel containing the sulphate of copper solution, stir well and add enough water to make $7\frac{1}{2}$ gallons, and use this at once as a spray, coating every part of the trees with the finest possible dew or film. If necessary, repeat in about three weeks. A third application may be necessary if the attack is a bad one at a similar interval.

Names of Fruits.—Notice.—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (H. R. D.).—Maréchal de Cour. (P. K.).—Beurré Superfin. (Mrs. J. H. Fanning).—Calebasse Grosse. (G. H.).—Pear Josephine des Malines. (J.B.).—1, Margil; 2, Winter Calville; 3, Cockle's Pippin; 4, Pearson's Plate. (T. S. N. P.)—1, General Todleben; 2, Beurré Diel; 3, Glou Morçeau; 4, Doyenné du Comice.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (H. M).—1, Pteris serrulata cristata; 2, P. cretica albo-lineata. (A. B.).—Woodwardia radicans. (Somerset).—Lælia autumnalis. (L. D.).—Hoya carnosa. (E. F.).—Centropogon Lucyanus.

PLANTS IN POTS.

PROFITABLE LIVE STOCK.

In a herd of cows selection and judicious breeding are the chief factors in obtaining really superior animals. See what they have done among the Shorthorns, Herefords, Devons, and Black-polled breeds for the production of beef, and among Channel Island cattle, Ayrshires, Red Polls, the Kerries, the cross breds aye and also among the Shorthorns, for the production of milk, butter, and cheese. Given careful selection, it really becomes very much a local matter of ways and means. It is not every man that can afford to indulge in the purchase of pedigree stock from a herd of high repute, but by being on the alert to purchase really good stock as opportunity offers the herd improves slowly but surely, becoming increasingly valuable and profitable year by year. Twice recently have we been shown the cow of its particular locality, one of them in Leicestershire, the other in Derbyshire. Both were remarkable for their regular yield of an exceptionally large quantity of rich milk. Such cows but too often are regarded as curiosities, without any thought being given to the possibility of herds of them being got together by selection and breeding. It is in this matter that a few thoughtful men of more than average intelligence combined with energy and steady perseverance excel. They never let any chance of obtaining such cows pass by, are willing to pay something extra for their fancy, and then take good care to turn them to full account.

In the report of a "Typical Farm in Cheshire and North Wales" in the last number of the Royal Journal, there are some interesting facts about the herds of cows kept by the Cheshire dairy farmers. Most of them evidently give preference to a cross between Shorthorns and Welsh, due attention being given in the crossing to the selection of the progeny of deep milkers. In only one instance is there mention of a cross between Ayrshires and Shorthorns carefully selected for the last twenty-one years. This was at Spurstow Hall, Tarporley, the farm of Messrs. David Byrd & Son, whose herd of 109 milking cows is a fine one, well fed, well cared for, and deep milkers. This herd is so well managed that we give some further particulars of it taken from the report. The practice of the farm is to sell the milk from the whole of the cows during the six or seven autumn and winter months of the year, and to convert it into cheese the remainder of the time. About eight cows go to each milker. Each cow's milk is weighed once a week. The milk is strained outside the dairy and conducted by an open trough into the milk vat, thus preventing any ingress by the milkers into the dairy. After cheese-making the whey stands for two days; the cream is then skimmed off by hand and churned into whey butter. The whey is afterwards carried by a pipe to a cistern in the piggeries and pumped therefrom into the pig troughs. The dairy, although adjoining, is distinct from the house.

The account kept by Messrs. Byrd is equally instructive. Here is part of it for last year.

DAIRY PRODUCE 1892 FROM 104 COWS.

475 lbs. butter at 11½d. 37 calves sold 30 ,, reared 26,175¾ galls. of milk sold Less freight 31,353 galls. of milk made = 12 tons 3 cwt. 0 qr. to cwt) = 553⅓ galls 1 qr. 22¼ lbs. cheese	into 459 ch 29 lbs. (12) per cow, 2	l lbs.	£ s. 6 24 14 45 0 938 18 1 135 1	per £ s 0 4 4 0 15 0 15 0 7 14 7 15	rage cow. d. d. 4 3 934 712	Total. £ s. d. 22 15 2½ 69 14 4 803 17 9
Whey, 17s. per cow \cdot .	•• ••	••		0 17		88 8 0
Total		••		£17 1	101	£1779 12 0½

The average for the thirteen years, 1880 to 1892, was £18 17s. 10d. per cow, and the falling off in 1892 was attributed to the unfavourable season. It would be curious to see how the average of the current year is affected by the drought. The bulls appear to be especially well selected, and seem likely to perpetuate the good dairying qualities of the herd. Numbers are kept up and increased by rearing the heifer calves. This is carefully done, and the heifers go into the herd with their first calf at an age of about two to two and a quarter years.

WORK ON THE HOME FARM.

Sorry indeed were we to see sheepfolds on Swedes since writing our last farm notes. The only thing in sound practice to justify such a thing would be the bringing of more land into course for winter corn. If Swedes are used in this way so long before Christmas what is to be done for the sheep later on in midwinter? There should now be for early folding Mustard, Coleseed, early Cabbage, and Thousand-headed Kale, some late growth of Clover, and mixed layers, with a run on pasture by day. Do not keep sheep of any sort confined altogether in the folds, a change is healthful, and a frequent turn on a hard road is good for them. Look regularly to the feet; allow no creeping in of bad cases of foot rot, but let the hoofs be pared whenever it is necessary, and any difficult case be at once isolated. Ewes forward in lamb must have quiet comfortable quarters, and be under very frequent observation by day and night. Do not disturb them at night, but approach them quietly just to see all is well and there is no disturbance, or worrying by dogs. This is entirely worth while. A friend of ours going to his ewefold one night found the fold empty, and evidence of a rush in several broken hurdles. The barking of dogs in the distance heard by him through the hush of night told the sad tale but too well. Two large lurcher dogs had driven them out of the fold to a considerable distance, and the loss both of ewes and lambs was most serious.

Home farmers having the advantage of a park with its lofty enclosures do well to have the ewes in there for a month or two before lambing time; they are then safe from nocturnal disturbance. Keep all ewes in lamb off the Turnips for every reason. We cannot too often repeat this note of warning. To allow them to consume large numbers of half-frozen roots tends seriously to lower vital heat, and so taxes the system seriously; to keep them in muddy folds causes so great a strain upon their frames as also to prove a severe trial just when they require extra care. Both things cause abortion largely in a flock, and foot rot often runs riot at the same time.

REMARKS.

5th.—Fair early; drizzly from 10 to 11 A.M., then occasional sunshine till noon, and bright afternoon and night.
6th.—Almost cloudless from sunrise to midnight.

of rain and hail, the sun shining meanwhile; generally cloudy after 3.15 P.M.

8th.—Cloudy morning; bright sunshine from 1.30 P.M. to 3.30 P.M., and generally cloudy after.

9th.—Bright sunshine almost throughout, with brisk N.E. wind.

10th.—Overcast throughout, and high wind in the morning.

11th.—Overcast till noon; much bright sunshine in afternoon.

A cool dry week with northerly wind and very little cloud.-G. J. SYMONS.

DURING the year 1885 we had the pleasure of inspecting the results of crossing one of the species of Potatoes described as Solanum Maglia with three good English varieties. This was at Reading, in the grounds of Messrs. Sutton & Sons, and in the same grounds we have had the pleasure of inspecting a no less remarkable and decidedly more promising output this autumn from a similarly conducted series of experiments. S. Maglia as the seed bearer and a seedling from Victoria as pollen parent crossed in 1887 produced two "hybrids," one having reddish, pebble-shaped tubers with no particularly attractive character to recommend them, the other wholly different, the tubers being round, of full size, white, with a rough skin like Schoolmaster; yet entirely distinct, unquestionably an interesting, and may prove a decidedly valuable acquisition.

In the summer of 1891 the well-known variety Imperator, also another unnamed cultivated Potato, were pollenised from the small reddish tubered No. 1 hybrid; also a commercial variety was pollenised from it as well. In the following year (1892) these hybrid Potato seedlings were remarkable for the number and size of the tubers they produced, and the present year's crops were looked forward to with no ordinary degree of interest. Though the impress of the pollen parent was very apparent in the growth, which to coin a word was decidedly magliaised, yet the tubers from the red polleniser were white with one exception, a mottled round, five of the other varieties being white rounds, and six white kidneys. The yield from some of these was remarkable. For instance, though the tubers planted were of necessity small, yet eight of them (No. 5), a lemon fleshed kidney, produced 33 lbs. 9 ozs. of extremely fine Potatoes; six tubers of No. 8 gave 17 lbs. 7 ozs. of mottled roundish tubers packed closely round the stem; eight small seed tubers of No. 11 gave 32 lbs. 2 ozs. of large white fleshed kidney Potatoes; and eight of No. 12 yielded 24 lbs. 3 ozs. of lemon fleshed full sized kidney-shaped tubers. Those four varieties appeared to stand out as the greatest producers from the twelve raised from the Imperator cross indicated—the red tubered variety as the pollen

From the other cross-an unnamed commercial varietypollenised as above, twenty-nine seedlings were raised, nine of them producing kidney-shaped, and the remaining twenty round tubers-all, both round and kidney, being white. The diversity in yield was very great, some giving poor returns, several fair to good crops, and others again large yields, the heaviest, No. 11, white round, being 25 lbs. 14 ozs., from eight small tubers. As a rule the round varieties were the best in this cross, the kianeys in the other. Also, as a rule, the crops possessed the characteristic strikingly apparent, of the tubers being thickly clustered, almost densely packed, close round the stems, and in this respect presented an appearance wholly dissimilar from Potatoes generally as the seedlings were lifted and "stood," for it cannot be said they were "spread," on the ground. Most of them were of medium size, but to have obtained this size so quickly and the bulk of many so great augurs well for the future, for if the bountiful character of the best of them can be combined with the almost faultless form and superior quality of the best of our cultivated varieties, there will be added to existing good properties an abundance in yield to which they at present have no claim. Whether this combination can be effected and fixed time alone can tell. The vagaries of Potatoes produced by intercrossing cannot be foreseen, they have a habit of sliding back, quickly or slowly, also intermittently, and often provokingly, to nature so to say. Some appear to attain constancy in a comparatively short time, while others "sport about" for years. They may be to all appearance "true" one season, and the next as uncertain as the weather—as "shifty," as it has been humorously described, "as a waggonload of monkeys." The one strong character of these seedlings, so strong that it ought to be retained, and exert a dominating influence on others, is the heaps of tubers packed and piled on each other, as if clinging together closely around, above, and below the parent set.

This is a character not, we think, possessed by Solanum tuberosum, the supposed progenitor of our present race of cultivated Potatoes. It may be so. Mr. Baker of Kew has no doubt about it, and he is a very great authority. At the same time, Heriot's report of the country visited by Sir Walter Raleigh describes the Potato as growing there in "damp places;" tubers as large as Walnuts, some much larger, and good for food either boiled or baked. This description would appear to apply more nearly to the coast plant Solanum Maglia than to the hill plant S. tuberosum, and Heriot was in the Raleigh Expedition when tubers were collected and brought to Ireland. It is certain, too, that anterior to the outbreak of the Potato disease in 1845 and in subsequent years, before endeavours were made to raise new varieties, that Potatoes were grown in fields and gardens in the north-eastern counties that had far greater resemblance to S. Maglia than S tuberosum; also it is certain that during the years of failure of English crops that large cargoes of Potatoes from Belgium, Holland, and Germany to our eastern ports had the Maglia characters of peculiar rugged (contracted in places) shape, as well as the purplish red colour; in fact, many of the tubers were so like Maglias that it would have taxed an expert to distinguish them from each other. But whether or not S. Maglia was once grown in England, and had a share in the production of English varieties, it is not to be found now among cultivators, and Messrs. Sutton & Sons have done well to obtain tubers from Kew for purposes of fertilisation in the hope of giving a more vigorous and consequently greater disease-resisting nature to stocks that may be raised from them, and possessing also the other good properties that invest the Potato with value as a commercial product and necessary article of diet.

But why, it will naturally be asked, these Reading experiments de novo, since an elaborate series was conducted not many years ago? Because there was a doubt as to identity of the species chosen, as we indicated at the time, pointing out that the variation in the tubers was clear enough for them to be separated into two sections differing in colour. In fact one of the plants sported and gave white tubers, while those of S. Maglia are as far from white as any tubers can be. The Reading firm, accurate and thorough in its undertakings, could not have the experiments rest on a doubt, and therefore set aside all the painstaking and time-consuming work, gaining nothing but—and this must be very valuable—information. Hence the new series and going back to the beginning, the experiments founded on fact and conducted with the same extreme care as it is possible to exercise in such work. Slow and delicate work it is, as may be understood by an example in routine.

Three seeds obtained from the first 1887 cross were sown on March 5th, 1888, and the first plant appeared on April 2nd. On May 30th, one cutting was taken from a side shoot, and three rooted suckers removed, all potted singly. In August seven cuttings were taken, and the plants grown in pots. In May, 1889, there were established in pots from tubers, cuttings, and offshoots twenty-five plants, four being sent to Mr. Baker, Kew, the rest planted outdoors, and so increased from year to year, the hybrid

remaining the same in every respect as the first year, except that the tuhers are rather larger.

The No. 2 seedling was grown in pots for three years on account of its weakness, hut last year (1892) was planted outdoors, which much improved it in size of tubers. Although a most trying season, there was no trace of disease. Three tubers were planted, but one failed. Upon lifting the two plants on October 11th, 1892, the crop consisted of twelve tubers—a very handsome white round, of excellent shape, and crackled skin, such as cultivators Six tubers were planted this year (1893), and upon examination when lifted four roots were found to be of the same type as the previous year, and these produced an extraordinarily large crop, but not quite so round in shape as last year, owing to a second swelling after the rain. The other two plants ran back to very small tubers and a large quantity of delicate fibrous roots, but the haulm was the same in every respect as the four plants just described, being very strong; leaves rough, like Victoria, but the points of the shoots resembling those of the

Such is the routine. The results obtained no one could see without heing interested and without wondering what will he the outcome of this most carefully conducted series of experiments. If perseverance has its reward it will in this case be well won after so many years of persistent work in endeavouring to increase the yield and improve the character of the most important of our root crops, and with such a foundation to rest on as has now been laid the conductors of the work are looking hopefully onward to the future.

AUTUMN AND WINTER HARDY FLOWERS.

The appearance above the ground of two autumn Snowdrops—Galanthus octobrensis and G. corcyrensis, gives us no ordinary degree of pleasure. Their own heauty will he great in a week or two, and with a protective sheet of glass we may enjoy them until their delicately beautiful sisters of January and February appear. One may well ask, Why should the garden of hardy flowers remain desolate so long? Why, with so many winter flowering plants should a walk along its paths show nothing of brightness, and little but a melancholy array of dead stems and tallies?

Looking along one of my rockeries the other day I paused before a good plant of Saxifraga Fortunei, and admired its thick and succulent looking leaves and its curiously beautiful flowers. They are alike curious and heautiful with their green sepals and unequally sized petals of white, which are described as "saw-edged," a term which may he botanically correct, hut which fails to express the form in which they are shaped so as to add greater attractions to the flower, and which one cannot properly describe. The lower one is longer than any of the others, while the two upper ones again are shorter than the two which come between. The golden hoss in the centre of the flower adds to its charms also, and a good plant with many of these flowers in panicles on thick, fleshy stems, fails not to please. Pity it is that the inevitable failing must be disclosed that early frosts at times play sad havoc with the plant, and that one night will destroy the hope cherished of the usual blooms. Fortune's Saxifrage, which was introduced from Japan in 1863, to be most satisfactory on rockwork facing almost due south, and planted in sandy peat with the addition of a quantity of gritty matter. It is increased by division, and a small piece I received a few years ago has now assumed quite respectable proportions.

Extremely beautiful for a long period has been Androsace lanuginosa. A fine plant on the same rockery as Fortune's Saxifrage is still in bloom, and its spreading stems of silvery leaves and rose coloured flowers with yellow eye, are very charming. I am referring to this plant at this time principally for the purpose of advising its covering with a sheet of glass or slate raised a few inches above the foliage, so as to throw off wet, and at the same time admit of the free circulation of air. When a slate is used I generally remove it during the day in fine weather, and, even with this trouble, I consider the slate preferable to glass, which in the spring sometimes overstimulates the growth. All my Androsaces are thus covered from October until March or April, and the little trouble is more than repaid by the wealth and heauty of these charming alpines.

The white "spring" Heath, Erica carnea alha, has been so long in bud that I was not surprised to see it in flower a few days ago, and thus coming in long ere the Cornish Heath, E. vagans, has passed

away. One is at a loss to know why more use is not made of this pretty Heather which, on sunny rockeries, will yield its bloom through some of the darkest and dullest months of the year. In my garden it is thoroughly at home, the white form which is sometimes known as E. herbacea, being always earlier than the flesh-coloured one.

The time is rapidly coming when the claims of the autumn and winter Crocuses to inclusion in our gardens will need little advocacy. I may, perhaps, be allowed to mention two as indicative of the variety of beauty we may have. One of these is C. cancellatus, of which the type has pretty little white flowers veined with purple at the base, the flowers appearing before the leaves. This species, which is a native of Asia from North Palestine to Armenia, varies in colour, however, from lilac to white, and thus a considerable variety may be obtained. Very charming, too, is C. ochroleucus, which I had previously but unfortunately lost, and received this year through the kindness of a reader of the Journal. This is a beautiful little Crocus of a pretty creamy white with orange base. It is a native of Syria and North Palestine, and appears to be rather tender. It is, however, worthy of all care, and a little protection will be well repaid.

The value and beauty of the Michaelmas Daisies become more and more apparent, and bushes of blue, purple blue, pink, lilac, and almost pure white in the borders fill us with pleasure. Nor are the flowers less beautiful or valuable when cut for house decoration. little favourite with me, not so much from the size or beauty of the individual flowers, but from the habit of growth of the plant and the charming appearance it presents when in full flower, is Aster diffusus horizontalis. It smothers itself with small white starrylooking flowers with raised pink centres. The plant is so sturdy in habit that in a position where it is slightly sheltered from our severe gales from the Solway it requires no staking or tying, a great addition to its heauty being gained by the absence of the comparative stiffness inseparable from such supports. This season it has reached rather over $2\frac{1}{2}$ feet in height, and its spray-like branches add much to the beauty of the garden. It has also the merit of being extremely hardy, and with moderate weather should bloom on until Christmas Day. Indeed, in former years I have cut flowers from it within a day or two of the New Year.—S. ARNOTT.

THE ORCHID GROWERS' MANUAL.

MESSRS. B. S. WILLIAMS & Son, Upper Holloway, inform us that they have a new (the seventh) and much enlarged edition of "The Orchid Growers' Manual" in the press, with numerous additional illustrations, which will be issued early in the new year.

LÆLIO-CATTLEYA STATTERIANA.

This is another of the many beautiful higeneric hybrids which have been raised by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea. It is the result of a cross between Lælia Perrini and Cattleya labiata, and is a charming novelty, meriting the first-class certificate awarded by the Royal Horticultural Society on November 14th. The flower, as depicted in the illustration (fig. 67), is large, the sepals and petals resembling those of Cattleya lahiata in form and colour. A trace of Lælia Perrini is noticeable in the lip, the front lobe of which is a rich purplish crimson. The base of the lip is white faintly marked with crimson.

ORCHIDS FOR FLOWERING AT CHRISTMAS.

ORCHIDS are always valued highly during the winter months, but at no period are they so much appreciated as at Christmas time, because most of those then obtainable furnish bright or distinct shades of colour, that are especially welcome when flowers are never too numerous or diversified. Many beautiful groups can be formed with the best of the winter-flowering Orchids, associated with Roman Hyacinths, a few early Lilies of the Valley, Ferns, and light Palms, as such arrangements are adapted for situations where bolder groups of the late Chrysanthemums are out of place. Some also are useful for cutting when flowers for buttonholes, sprays, or choice houquets are not very abundant. As the present is a critical and important time in the preparation of Orchids for Christmas, the opportunity has been chosen to give a few practical hints on the general management needed to ensure a prospect of

success, also to name some of the species or varieties which have been proved by many years' experience to be the most reliable and satisfactory for the purpose.

The Orchids that may be had in flower at the particular season now under consideration can be classed under three heads:-Firstly, Those which flower naturally in late December, or that require little assistance to induce them to do so. Secondly, Those which usually flower in November or January, and that may be retarded or hastened sufficiently to cause the production of the flowers when desired, or to prolong the usual period. Thirdly, There are some Orchids almost continuously in flower, or which blossom at different seasons and occasionally yield their

attractions in midwinter. Upon the first group we must chiefly depend for our Christmas display, and to them the principal attention will be devoted in these notes. With regard to the second group there is more uncertainty and risk, as the majority of Orchids do not readily submit to the ordinary processes of hastening or delaying the flowering period. In either there is often much danger of losing the blooms, and even the plants themselves, unless of naturally vigorous habit, will frequently suffer to a serious extent. Forcing, as commonly understood and practised, can be safely adopted with very few, and

temperatures and the due but not excessive supply of moisture, while near large towns a still greater difficulty is found in the poisonous fogs that too frequently spoil all our hopes just as they are on the point of being realised. One essential must be kept in view in the preparation of such plants for winter flowering, and that is to have them as sturdy as possible with firm, well-developed, and matured leaves, or in the case of the partially deciduous kinds to ensure plump, thoroughly ripened stems or pseudo-bulbs by a previous season's careful culture. The avoidance of excessively high temperatures, with great quantities of moisture and insufficient ventilation, or exposure to light, is absolutely necessary to ensure the required condition, and happily the present season has been in many respects most favourable to the maturation needed. The

hot bright weather has imposed a severe tax upon growers in many ways, but it has permitted a free and continuous ventilation which with attention to supplying sufficient water to prevent the ill effects of a parched atmosphere on delicate foliage, has ensured a ripening that will enable the plants to endure their

winter's trials with less danger.

It is a common mistake with beginners in Orchid culture to fancy that their success must largely depend upon the accuracy with which they maintain certain temperatures for each month as given in the

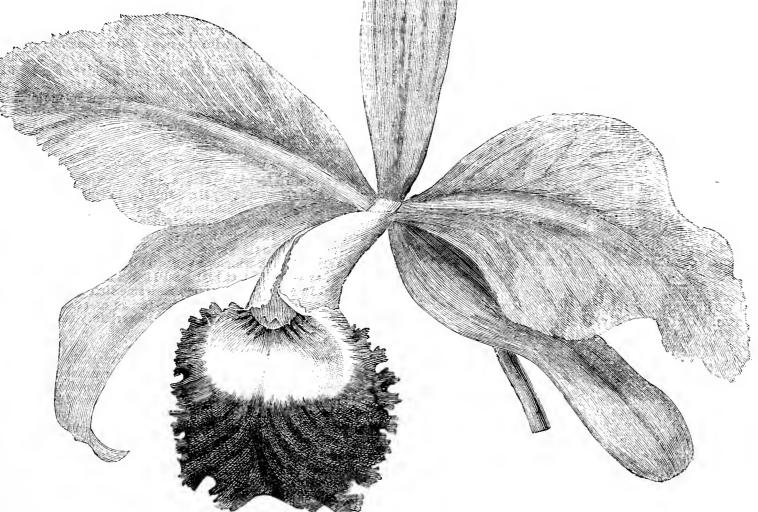

FIG. 67.—LÆLIO-CATTLEYA STATTERIANA.

these chiefly the deciduous kinds bearing large pseudo-bulbs as storehouses of nourishment, such as the Dendrobiums of the nobile and Wardianum types, the Calanthes and a few others. Even with them the truth of the old adage, "The more haste the less speed," is often exemplified, and "hasten slowly" may serve as a useful motto for Orchid growers who wish to secure plants in flower before their usual season. In the third group a long list could be given of Orchids that have been had in flower during December, for in large collections some will produce occasional flowers at all seasons; but these may be termed the accidents, and the only sorts to be relied upon in this group are those which flower almost continuously throughout the year, some of the hybrids being remarkable examples of this character, especially Cypripedium or Selenipedium Sedeni, for I have had vigorous plants of this which have not been without flowers expanded or showing for nearly three years.

As regards the winter treatment of Orchids to yield flowers freely and retain them as long as possible, the difficulties that cultivators have to contend with are chiefly in the regulation of

guide books and calendars. In this they misunderstand the object of the writers, who, if they are practical men, usually try to furnish some indication of what is required to be varied according to circumstances by the judgment of individual cultivators. Nothing leads to more disastrous results in the winter culture of Orchids than endeavouring to keep up a fixed temperature by hard firing when outside the thermometer may be down extremely low. Fuel is consumed wastefully, and the air in the houses is dried to such an extent that water has to be distributed liberally, ventilation is impossible, and the plants are exposed to a "stewing" atmosphere, effectually weakening the growth and foliage already made, and frequently encouraging the production of unseasonable growths at the expense of the plants themselves, the flimsy leaves seldom properly mature, and a good period of flowering can never be recognished expected under such conditions flowering can never be reasonably expected under such conditions. It is far better to allow a fall in the warm houses of 5° or even 10° in exceptionally severe weather, reducing the supply of moisture proportionately, without permitting the plants to suffer in any way, than to parboil them for the delusive satisfaction of preserving a regulation temperature.

There are always some plants more delicate than others and more impatient of variations in the heat provided, and whether these are grown in an Orchid house proper or in a structure containing other plants, they should be assigned positions where the conditions are more in accordance with their requirements. Observation will soon acquaint a man with peculiarities of this character, and I have had in my own experience many striking examples of how much attention to this matter will contribute to success. There are, indeed, few plant growers who could not bear witness to the strange partiality displayed by some plants for particular positions in houses, and how they will thrive just where they are suited and not succeed so well in another part of the same house. In the winter, when all circumstances are more trying to plants and cultivators, these apparently simple matters become very important.

In providing ventilation at the present time and onwards much caution must be exercised, as though the day may be extremely bright, yet a cold cutting wind admitted direct to the foliage is a prolific source of injury. For winter the openings of the ventilators should be covered with perforated zinc or some woven material that will prevent a sudden inrush of cold air, and the method of admitting air from the outside by means of pipes under the paths, gratings or hot-water pipes is very convenient, as it can be stopped at any time and does not admit too great a body of air at once. In unusually severe weather it is better not to attempt ventilation at all; in fact, whenever the temperature is near freezing point it is not safe or necessary if care is exercised in regulating the heat as already suggested.

With one more hint we will close these notes on general management. This is in regard to the application of water, which should always be employed of the same temperature as the house, for supplies of cold water to the tender roots are even more dangerous than draughts of cold air on the foliage. When tanks are inside houses which catch the rain falling upon the house, it often happens after heavy autumn or winter storms that the large quantities of water admitted remain of a low temperature for a much longer time than is supposed unless pipes pass through the tank. It is preferable to keep a can or two full of water standing near the pipes to be used only for watering the plants, the other being employed for damping the paths or shelves. Syringing the plants is better dispensed with altogether unless the weather be warm and bright, when one occasional dewing will refresh the foliage greatly.

Most gladly would we give an antidote for the ill effects of fogs were such a one known. Unfortunately, though, the chief difficulties Orchid growers have to encounter in the Metropolitan district in the winter are caused by the fogs, and many a promising Christmas display has been cut off prematurely by a day or two's dense fog in December, yet little can be done to prevent or nullify the injuries. It is advisable to keep the house as securely closed as possible, avoiding opening the doors unnecessarily; and some advantage has even been found from pulling down the blinds where these are still attached. Very little moisture should be distributed about the house, and none on the foliage. This is all that can be done, and with the greatest care it must often result in the loss of many flowers, and can only be regarded as in great degree an unavoidable evil, though it must be observed that the conditions of sturdy growth already advocated assist considerably in enabling the plants to withstand the evil influences. Selections of Orchids for flowering at Christmas will be given in a future issue.—Orchidist.

NOTES BY THE WAY.

SOME FINE CONIFERS.

GARDEN wanderings lose their charm to a large extent when the thermometer registers several degrees of frost and the snow and sleet are being driven wildly about by a hiting wind. And even when these conditions are varied by thick fogs or soaking rains the conditions are little more tempting. It is easy enough to find inspiration when the spring sunshine illuminates the garden or the mellow breath of summer is upon it, but in autumn it is impossible. We must live now on memory and hope—on recollections of the past and anticipations of the future.

In a retrospective survey of gardens visited during the past summer my thoughts rest on one where a noble collection of Conifers graces the surroundings of a pleasant Sussex residence. It is near East Grinstead, on the road running from Purlcy Corner through the beautiful valley hetween the Caterham hills, past Riddlesdown, Godstone, and Blindley Heath, and so on to Felhridge. In the years that are past the road was frequently traversed by gentlemen driving down from town, but it is left now to the holiday seekers and the cyclists. The latter

revel in its easy gradients and smooth surface more than in its richness of wayside gardens and the charming views which open out from it, for even if they have nowhere in particular to go they are always in a desperate hurry to get there, and have no time to waste on trifles.

Felbridge Place lies on the right hand, a mile or two on the London side of East Grinstead. The house commands delightful views, and gives one fresh impressions even after he has seen, as he may have thought, every variety of scenery which this heautiful corner of England possesses. Truly Grinstead has a charm all its own. The town itself presents attractions foreign to most country places of its size, and it would he easy for any fortunate individual who had nothing to do but rove during the golden days to pass more than one pleasant week in its gardens and byeways.

Mr. Gatty, the owner of Felbridge Place, has strong scientific leanings. This, of course, is vague for those to whom science represents more than some formidable abstract thing, and who ask for details, but it is all I know. Let it suffice to say that his studies, whatever they may he, are not so absorbing as to prevent him appreciating the merits and beauties of the very fine collection of Conifers which surround his house. I understand that his knowledge of the trice is no limited one, but that he is fully capable of judging whether there is anything of special value amongst his trees. To give general readers an opportunity of forming an opinion I will proceed to name some of the specimens and to indicate their altitudes.

One of the first trees to he observed and admired is a noble specimen of the Silver Fir, about 90 feet high and 9 feet in girth. Unfortunately I have to give approximate figures, and cannot say with certainty how this specimen would compare with the one at Dropmore. In Mr. Cecil Bartlett's paper on the Dropmore Conifers, published in the Journal on April 20th this year, he gives the height of a Silver Fir as 94 feet, and the girth as 8 feet 6 inches. I should say that these trees must he as near twin specimens as it is possible to find, and a splendid pair they are. Dr. Gatty's tree is perfect in every way, and measured by the simple system adopted hy Mr. Harding at Orton seems to excel the Dropmore tree in girth if not in height.

A Wellingtonia, 70 feet high, also attracts attention. This is a source of special pride to the gardener, Mr. Jupp, for he planted it himself, a bantling $7\frac{1}{2}$ inches high, in a thumh pot thirty years ago. While the planter has been growing grey the tree has been gaining rapidly in vigour and heauty. It is an almost faultless specimen as to shape, and is a great ornament to the grounds. Mr. Bartlett describes one of the Dropmore Wellingtonias, which was planted ahout six years before the Felbridge one, as heing 67 feet high and 11 feet 3 inches in girth, and a second, planted in 1862 or just about the same time as Mr. Gatty's tree, as 62 feet high and 12 feet in girth. So far as an estimate tells us the Sussex tree is taller than either, and has certainly made more rapid growth.

Another very fine tree is Taxodium sempervirens, 60 to 65 feet high, 29 feet in girth, and it would have been more remarkable hut for losing 14 or 15 feet of its top in a gale of wind. Ahies Douglasi is a handsome specimen, hut it would appear to be hut a babe beside the marvellous Dropmore tree, which is said to he upwards of 120 feet high, the hranches sweeping the ground at a diameter of 64 feet. There is ohviously no comparison here, so I must pass on to Cedrus deodara. The height of this is put down at 75 feet, while one at Dropmore is given as 72 feet high, which means another wonderfully close struggle for supremacy. The Felbridge specimen is in every respect a noteworthy one, and it would be interesting to have its height carefully taken and supplied.

This point of exact measurement is emphasized when we come to Finus insignis, for in my notebook I have the altitude jotted down as 90 feet, and on turning to Mr. Bartlett's paper I find, curiously enough, that he quotes a tree as being exactly the same height at Dropmore. Which of the two is the finer is doubtful; they are both splendid specimens. That at Felhridge Place spreads like a huge forest tree. Another nohle giant is Abies Nordmanniana, which is 80 feet high, of perfect shape, being even from top to hottom, and it was full of cones. In the notes on the Dropmore collection this is classed with others as "good and healthy," hut the altitude is not stated. Other fine Pines are P. nobilis, 85 feet high, and Monticola, 50 to 55 feet and full of cones. P. cembra, P. Benthamiana, and P. Pinsapo run from 30 to 35 feet, P. Benthamiana is therefore well heaten by the Dropmore tree, which is quoted at 56 feet, and must be a wonderful object.

There is no such Araucaria imbricata at Felbridge as the gigantic 70 feet tree at Dropmore, the largest hardly exceeding 40 feet, hut it is a very heautiful specimen, its contour being perfect. Nor is Abies Albertiana so fine, its altitude heing about 40 feet as against 60 feet in the case of the tree under Mr. Herrin's charge. A. Hookeriana, though a small tree, is extremely beautiful, its glaucous foliage heing very distinct and prominent. A. grandis again is not more than 40 feet, and A. concolor will not grow at all, hut A. nobilis glauca towers up 75 feet or more, and is a truly noble tree.

Mr. Bartlett contents himself with saying in reference to Cryptomeria japonica that there are some fine specimens of good shape and with branches to the ground. Mr. Gatty boasts a tree 45 feet high. The branches are rooting and young shoots springing up. Cupressus Lawsoniana erecta viridis, 30 feet high and in splendid colour, is also noteworthy.

Laurels and Rhododendrons thrive with wonderful luxuriance at Felbridge Place, and there are many splendid Beeches' and Oaks in the It is without doubt one of the most interesting of what I may term the tree places in the country. The gardens are well managed throughout, but my object when commencing these notes was to refer only to the Conifers. What I have said will enable skilled readers to see for themselves that Mr. Gatty's Conifers are capable of providing a rich source of pleasure for every tree lover.—W. P. WRIGHT.

NATIONAL ROSE SOCIETY.

WE are informed that the annual meeting of the National Rose Society will be held at the Horticultural Club Rooms, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 7th, at three o'clock; the Rev. W. Wilks, Secretary of the Royal Horticultural Society, will take the chair. The annual dinner will be held at the same place on the same day at 6 P.M. The dates fixed for the Exhibitions in 1894 are:—The Southern Exhibition, June 27th, at Windsor; Metropolitan Exhibition, Crystal Palace, July 7th; Northern Exhibition at Halifax, July 19th.

MR. MAWLEY'S ANALYSIS.

"BUCKS" (page 440) reminds me of the little street boys who tie crackers to my hall door and then run away—they amuse themselves, don't hurt me, and remain in the obscurity they prefer, and to which their methods are best suited! I am sure Mr. Mawley will feel as proud of his champion as I feel deeply injured by this anonymous gentleman's "tremendous onslaught" on me.

Without wisning to detract one iota from Mr. Mawley's services to the N.R.S., which in fact I have never brought into question, I must notice the last paragraph of "Bucks'" communication; and in comment thereon, say that the N.R.S. was formed in 1876, and I joined the Society in 1878, so that the words subsequent to "long years" are nonsense.

Very evidently not to be known by "Bucks" is to be unknown!—

CHARLES J. GRAHAME, Croydon.

[We suspect that Mr. Mawley could give a different version of Mr. Grahame's work in connection with the N.R.S. to that which seems to be entertained by "Bucks."]

THE ROSE IN 1893.

I HAVE now grown Roses for more than a quarter of a century. I have visited most of the Rose gardens in the kingdom, and have had as Secretary of the National Rose Society from year to year much intercourse with the principal Rose growers both amateur and professional. I have heard various and contradictory reports as to the condition of the plants and flowers, but never during all that time have I heard from growers so general a condemnation of the season (if I except the northern men) as in the present year of 1893. This was all the more regretable, as early in the year the prospects were bright, and the hopes of exhibitors proportionately elated.

The wood had been fairly well ripened in the autumn, the winter had not been very severe; January and February preserved their normal character, and at the time of pruning wood was strong and the buds promising; but from that time all was changed. We had no April showers, and a period of droughtunexampled I believe in our climate set From March to July, a period of four months, we had not in this locality I inch of rain, and consequently no good Rose season could be anticipated: the result of the shows proved this to be true. The southern grower was handicapped, the sub-tropical character of the season had driven the flowers into bloom long before their proper time, and consequently those varieties which bloom early were pretty well out of the field; while from the earlier districts nothing was to be seen. There can be no question that it was a hard time for amateurs especially. The nurseryman has perhaps many places differing in soil and situation, and as Roses are worked on various kinds of stocks, in a season like the present if he cannot cut from one portion of his grounds he can from another. The amateur on the other hand is confined to one small piece of ground on which he is obliged to grow his Roses year after year, and I often wonder that under such circumstances he is able to show as well as he does. In a season like the past one the small amateur fared especially badly. The characteristics of the year were drought, abundance of sunshine and heat; day after day as the Rose exhibition season approached the skies were absolutely cloudless, and a brilliant semi-tropical sun shed its influence all around. What could, then, the small amateur with his few plants hope to do? It was no wonder that his exhibits generally were below the average, and that even the larger

amateurs had to confess that most of their flowers were not worthy of their reputation. There were, of course, the usual differences of opinion as to the effects of the season. While some suffered severely from aphides and orange fungus others were comparatively free. I did not see one of the former in my Rose garden, while others said their plants were smothered with them. Orange fungus, which has in some years almost denuded my trees in July, was but little seen, while mildew, which so disfigures the Rose garden if it does nothing else, did not appear until late, when its ill effects were comparatively trifling.

It was a year, however, in which the northern part of the kingdom had it all its own way. Messrs. Harkness & Son of Bedale, Yorkshire, again achieved what no other firm has ever done, namely the winning of the two challenge trophies in the same year. To the north, too, went the amateurs' challenge trophy, and it was won by a young amateur, Mr. A. Whitton, a near neighbour of Messrs. Harkness. Messrs. Mack of Catterick, Croll of Dundee, and Cocker & Sons of Aberdeen were also forward in the race, the fact being that while in the south we were pretty well frizzled, the north and Scotland had been enjoying refreshing rains and cooler weather. Although the Messrs. Harkness succeeded in carrying off the jubilee trophy at Worksop, they were run very hard by Messrs. Alex. Dickson & Sons of Newtownards, a remarkable feat when we recollect they had to bring their flowers some miles the other side of Belfast, across the Channel, and to take them a long railway cross country journey to Worksop-a striking example for those who think it necessary to postpone the cutting of their flowers to the very last moment. There was one very remarkable feature which has been already commented upon by my good friend "W. R. Raillem," who always writes instructively, and that was "W. R. Raillem," who always writes instructively, and that was the behaviour of the darker Roses in such a season. We have always been accustomed to regard continuous sunshine as seriously injurious to their beauty. The edges of the petals become disfigured, the colour is taken out of them, and they look as if scorched; indeed, we generally speak of them when in this condition as being burned. How came it, then, that when weeks of bright sunny days prevailed this calamity did not take place? Such flowers as Louis Van Houtte, Reynolds Hole, and Camille de Rohan, Prince Arthur, Duke of Edinburgh, Horace Vernet, and others were never cleaner or brighter than in the past season—I speak not of those which were carefully covered over, but of those growing in the open unshaded. There must be something else than sunlight to account for this! It may, indeed, have been said to have been a Horace Vernet year, for never was this grand flower more generally exhibited in good form than in this year, when its raiser was taken away from us. Neither, on the other hand, as we might have supposed, were the light Roses remarkably good. Her Majesty, for instance, which had been so well shown in 1892; Mrs. John Laing, the best of the late Mr. Henry Bennett's Roses; Mons. Noman, La France, and others were not conspicuous for their superior form, while the earlier flowering varieties were all over before the exhibition

Although three gold medals were awarded by the N.R.S. for new Roses, there never was a greater scarcity in this class; the foreign raisers seem to have expended all their energies in the varieties they have already given us, and neither in the class of Hybrid Perpetuals or Teas does there seem to be anything amongst the Roses of 1891 worth recording. Two Hybrid Teas have made their appearance, and one of them is highly spoken of as an exhibition Rose, and one (Caroline Testout) has been praised by such good authorities as the Rev. J. H. Pemberton and Mr. Ben Cant. The other (Gustave Regis) is a charming buttonhole Rose, in which its chief value consists. The two exhibition Roses to which the gold medals were awarded came from the North of Ireland, and there is every reason to believe that Marchioness of Londonderry (white) and Mrs. Sharman Crawford (bright pink, something of the shade of colour of Madame Gabriel Luizet) will keep up the reputation of the raisers, Messrs. Alex. Dickson & Son of Newtownards, who have already given to us such fine Roses as Earl of Dufferin, Margaret Dickson, Marchioness of Dufferin, and Ethel Brownlow. The other certificated Rose was Turner's Crimson Rambler, a garden Rose from Japan, and likely to be most valuable for decorative purposes. Charles Gater (Paul & Sons) is a red Rose of great brightness, but somewhat small to suit present tastes. Harkness' Merrie England, the best of all striped H.P.'s, was not shown in as good form as in 1892. It seems, however, to be tolerably constant, and if so will be a very great addition to our gardens.—D., Deal.

(To be continued.)

THE KEEPING OF APPLES.

WITH the exception of the real late keepers, Bramley's Seedling, Northern Greening, French Crab, and others of a hard nature, it seems doubtful whether any of our best varieties of Apples could this winter be induced to keep long. If the fruits, because of the long drought, have so marked a deficiency of juiciness or sap in them that they so soon become dry and woody it would be impossible by any method of keeping almost to replace what Nature has not furnished. But that our ordinary methods of keeping Apples through the winter are far from being the best there can be no doubt. We exhaust our fruits far too much by keeping them in a comparatively dry atmosphere, where all the surroundings are absorbent, and not infrequently the temperature varies from week to week fully several degrees. The practice of burying Apples in tubs in the earth is doubtless a good onc, but then fruit in such case is so difficult of access. On the other hand, the amount of exposure to moisture that Apples will beneficially endure is astonishing. Who that has been raking leaves beneath Apple trees some two months perhaps after the crop has been gathered has not found some fruit buried in the leafage that are as plump and fresh as if just gathered! How admirable do the surroundings seem to suit

Apples in such a case.

Has anyone ever tried the stacking of Apples in leaves outdoors? hard floor beneath trees is selected, a bed made up 10 inches high with solid pieces of turf, the floor thinly littered with clean Elm leaves, then on that a layer of Apples, then a layer of leaves very thin, further layers of fruit and leaves, keeping the top into ridge fashion, covering ail with 6 inches of leaves, and over all some straw mats to throw off the rain. Into such a pit no ordinary frost could enter, and during very severe weather a thick coating of litter laid over all would exclude the hardest Can anyone doubt but that from out of such a stack Apples would come as fresh as possible, even at the end of the winter, whilst the plan would cost next to nothing? Of course only picked fruits of good medium size should be so preserved.—A. D.

I HAVE read with interest Mr. Iggulden's article (page 437) as to the results of Apple culture this season, and I endorse most of what he says respecting the non-keeping of the fruit. Most varieties are over fully a month before their time, but it must be borne in mind that

they were ripe for quite that period before their usual time.

Our experience as to varieties seems to have been very similar to Mr. Iggulden's. Beauty of Kent, however, we do not expect to keep after the end of November in ordinary seasons, but Manks Codlin is still in good condition with us, and this variety I have noticed usually keeps longer from our heavy soil than from others. Welington (Dumelow's Seedling), Alfriston, and Lane's Prince Albert are also keeping well at present, as also are most of the late desserts. Amongst the midsean varieties King of Pippins is keeping well.

It was quite expected that fruit would not keep well owing to the great heat, and there were many cases of actual sunburn, the same as they experience in California. The dry hot period, being followed by a spell of wet immediately before the ripening, was undoubtedly the cause of the spots and the rapid decay of the fruit. I should think it probable that the sudden flow of sap when the fruit was almost ripe caused the rupture of some of the cellular tissues, thus setting

up fermentation and decay in the parts affected.

As to the American varieties, these have with us done better than ever we have known them before. Washington, Melon, Mother, and King of Tomkins County, have all done remarkably well. I cannot, however, speak of Newtown Pippin, as we long since gave up growing it as worthless in this country. It does not, however, at all follow that it would be wise to plant these varieties extensively; in fact I consider that it would be the greatest folly to do so, as probably another generation will pass before we experience a similar season. Therefore, let us not be alarmed by the exceptional circumstances of the past extraordinary summer, but continue to plant those varieties which experience of years has taught us to be the most reliable for giving an average crop.

I quite agree with Mr. Iggulden that we are now in some danger of running to the extreme of planting too few varieties. Unfavourable as the season has been, and probably disastrous to some growers, yet there are many others who have done well. I was looking over some plantations in our county (Sussex) the other day where bush Apples are grown in large numbers, and principally of early varieties, and the proprietor spoke of being well satisfied with the result of this year's operations. He sent his fruit to market early and realised good prices.—Joseph

CHEAL.

NEWTOWN PIPPIN, Sutton Beauty, Peck's Pleasant, Mother, Melon, Washington, King of Tomkins County, Buckingham, Monmouth Pippin, Winter Peach, Wagener are all in good condition, and seem likely to keep. English Apples are in very bad condition. -T. FRANCIS RIVERS.

FLORAL NOMENCLATURE - CURIOUS SPELLING OF NAMES.

I CANNOT quite understand on what grounds "S. W. F." (page 439) bases his criticism of my remarks on this subject (page 399). His first sentence implies that I had recommended gardeners to make themselves acquainted with Latin, Greek, and French, whereas I never even hinted at such a thing, knowing how utterly impossible the task would be. The greater number of the youths who take to gardening know little or nothing of these languages at the time of their leaving school, and when they get to work there is not much time left to devote to them after the more urgent studies have received attention, even had they inclination and capacity for acquiring them. This being so, pronunciation and spelling will, no doubt, remain faulty, as your correspondent remarks, and certainly will this be the case when either are required on the "spur of the moment;" but as writing labels for home use or to place on exhibits is, or ought to be, undertaken deliberately, I repeat there is no necessity whatever that the least mistake in spelling should occur, for the simple reason that the reliable guides named in my letter are easily procured.

With regard to my "list of errors," which it appears to "S. W. F. that most have arisen "from an endeavour to copy illegible labels," it is not quite clear whether he means that I or the exhibitors had

"endeavoured to copy." I, however, carefully copied the card or paper labels attached to the exhibits, which labels had doubtless been written for the occasion. The exhibitors ought to have copied a good cata-

I quite agree with your correspondent that the mastery of these long names is one of the gardener's hardest tasks, and being one of them, and not a classical scholar, I can speak from experience. join with him in respecting those who have overcome the attendant difficulties; but the gardener who exhibits such spelling as the specimens I gave at page 399 deserves—well, to have his attention drawn to it, for I am convinced that it arises from nothing else than negligence. The careful man who has a doubt will find ways and means to satisfy himself about it.—WEST ANGLIA.

FEEDING FRUIT TREES DURING AUTUMN AND WINTER.

I QUITE agree with Mr. Dunkin, page 349, that not nearly enough attention is paid to the roots of trees after the fruit has been gathered. Very often we experience a long spell of dry weather during September and October. How can the buds for next year's supply of fruit be in a fit condition to give a full crop of the finest fruit if the roots are not

supplied with the proper nutriment?

Directly the fruit is gathered from any kind of wall tree I have the soil for several feet away from the wall thoroughly soaked with clear water. All kinds of hardy fruit except Peaches, Nectarines, and Cherries receive much benefit from a copious supply of liquid manure during the winter. Several Apple trees fifteen years planted produce good crops of fruit now that hardly bore at all previous to the stimulant being given them. To no other cause do I attribute the improvement in these

trees, but it is right also to record a failure.

The soil here is heavy and retentive. The application of liquid manure to the roots of Warner's King Apple during the winter caused the fruit the following season to be hollow in the centre. Since we ceased giving the winter stimulant we have had no hollow fruit, though it is smaller. The fruit perhaps does not attain the same size as previously, but it is sound, and that is of more consequence. I do not say the same defect would be visible in light soil. If the weather of February is dry I usually well soak the soil about the trees then. To a tree of the age stated we give not less than 80 gallons of liquid manure direct from the farmyard tank. A mere surface watering does little if any good.— E. MOLYNEUX, Swanmore Park, Hants.

ROYAL METEOROLOGICAL SOCIETY.

THE first meeting of this Society for the present session was held on Wednesday evening the 15th inst., at the Institution of Civil Engineers, Great George Street, Westminster, Dr. C. Theodore Williams, President,

in the chair. Twenty-three new Fellows were elected.

Mr. F. J. Brodie, F.R.Met.Soc., read a paper on "The Drought of 1893, and its Attendant Meteorological Phenomena." anthor confined his investigation to the weather of the four months March to June, during which period the absence of rain was phenomenal; barometric pressure was greatly in excess of the average, temperature was high, with a large diurnal range, and the duration of sunshine was in many places the longest on record. The mean temperature over England was about 4° above the average. Along the south and southwest coasts the sunshine was between 50 and 60 per cent. of the possible duration. The rainfall was less than half the average amount over the southern and eastern parts of England, the extreme south of Ireland and a portion of Durham and Northumberland, while over the southern counties of England generally the fall amounted to less than one-third of the average. The smallest number of days with rain was at the North

Foreland, where there were only eighteen.
Mr. W. Marriott, F.R.Met.Soc., gave an account of the "Thunder and Hailstorms" which occurred over England and the south of Scotland on July 8th, 1893. Thunderstorms were very numerous on that day, and in many instances were accompanied by terrific hailstorms and squalls of wind. It was during one of these squalls that a pleasure boat was capsized off Skegness, twenty-nine persons being drowned. About noon a thunderstorm, accompanied by heavy hail and a violent squall of wind passed over Dumfries and along the valley of the Nith. Many of the hailstones measured from 1 inch to 1½ inch in length. At the same hour a similar storm occurred at Peterborough. From about 2 until 10 P.M. there was a succession of thunderstorms over the north-east of England and south-east of Scotland, and at many places it was reported that the thunderstorms were continuous for nine hours. Two storms were remarkable for the immense hailstones which fell during their prevalence over Harrogate and Richmond in Yorkshire. The hailstones were 4 and 5 inches in circumference, and some as much as 3 inches in diameter. Great damage was done by these storms, all windows and glass facing the direction from which the storm came being broken. It is computed that within a radius of five miles of Harrogate not less than 100,000 panes of glass were broken, the extent of the damage being estimated at about £3000. The thunderstorms in the northern part of the country travelled generally in a north-north-westerly direction at the rate of about twenty miles an hour. They appear to have taken the path of least resistance, and consequently passed over low ground and along river valleys and the seacoast. Several storms seem to have along river valleys and the seacoast. followed each other along the same track.

EVENTS OF THE WEEK.—Apart from the meeting of the Committees of the Royal Horticultural Society at the Drill Hall, James Street, S.W., on Tuesday, the 28th, but few events of horticultural interest will take place in the metropolis during the ensuing week. The Royal Botanic Society will hold a meeting at the Gardens, Regent's Park, on the 25th inst., and the annual dinner of the National Chrysanthemum Society is announced to take place at Anderton's Hotel, Fleet Street, on the 30th inst.

THE WEATHER IN LONDON.—Since publishing our last issue some stormy weather has been experienced in the metropolitan area, as in other parts of the country. A gale of wind, accompanied with rain and snow, occurred on Saturday night, snow continuing to fall more or less the greater part of Sunday. It soon disappeared, however, but much damage has been done in some localities. Monday was fine, and the same may be said of Tuesday. Wednesday opened dull but dry, and at the time of going to press it is rather cold.

WEATHER IN THE NORTH.—The beginning of the past week from the 14th was dull, with rain on the evening of the 16th and the following morning. The violent northerly gale of Saturday morning reached its height about 2 A.M. Roads and railway lines were blocked with fallen wood, and damage was done to buildings and farmyards. In the woods the havoc is terrific. The past two days have been cold and bright, and 9° of frost are registered this morning (21st), with dense hoar frost. In the Blair Drummond Policies the wreckage is almost indescribable. Grand old trees, which have more than a local name, lie in hundreds uprooted, or with their great stems snapped at various heights. Oaks, Beeches, Larch, and Spruce Firs seems to have suffered most, and the state of the fine old grounds is most lamentable. On the adjoining estate of Lanrick half the woods are said to be down.—B. D., Perthshire.

— ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral meeting of the Society will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, November 28th, when special prizes will be offered for groups of Chrysanthemums naturally grown. At three o'clock Mr. T. Crasp, F.R.H.S., will deliver a lecture on "Latekeeping Grapes."

— HORTICULTURAL CLUB.—The usual monthly dinner and conversazione took place last week. There were present Messrs. John Lee, Harry J. Veitch, J. S. Cousen, C. T. Druery, George Paul, T. W. Girdleston, and others. The discussion was on Cannas, and was opened with a very able and instructive paper by Mr. George Paul, in which the history and the mode of culture were exhaustively stated. An animated and interesting discussion, in which most of the members present took part, followed, and a cordial vote of thanks was awarded to Mr. Paul. Mr. Charles Turner contributed some fine dishes of Apples and the Chrysanthemum blooms for the decoration of the table.

- RANUNCULUS LYALLI.—This is the beautiful New Zealand white-flowered Buttercup which has tantalised English horticulturists for the last twenty years at least. Those who have seen it growing wild on the mountains in New Zealand, and have cultivated it in the gardens there, are unable to understand how it can fail to thrive in English gardens. Roughly described, remarks Mr. W. Watson of Kew, in the "Garden and Forest," R. Lyalli is as effective and beautiful in flower as the white Anemone japonica, growing as high, flowering as freely, and behaving in the same satisfactory manner in New Zealand as that species does with us. In foliage it is even more effective than the Anemone, the leaves being peltate, rich deep green, and from 8 to 12 inches in diameter. The roots are tuberous. Failure with this plant in England is not due to cold, nor do I think excessive heat in summer hurts it. There is, however, some condition, some peculiar hitch which we cannot get over if we attempt to grow the plant out of doors. We have flowered it in pots in a cool Orchid house at Kew, but it was weak, and Mr. Moore of Glasnevin can grow it and flower it in a cold frame facing north, the plants being in pots, stood in shallow pans of water. At Reading, Mr. Bartholomew has grown it fairly well in an open

—— STEPHANOTIS FLORIBUNDA FRUITING.—Mr. Robt. Wastling, market gardener, Beverley, has a young plant of Stephanotis floribunda bearing a fine fruit. Should any persons in the neighbourhood be sufficiently interested to give a call, Mr. Wastling would, I am sure, be very pleased to allow them to see it.—George Swalles, Beverley, East Yorks.

— MAIZE MATURING IN WALES.—Mr. F. C. S. Brenton, Rose Cottage, Llantwit Vardre, Pontypridd, writes:—"It may be worthy of your notice that I have this year grown several stalks of Indian Corn with fully developed cobs. Some of the stalks were 8 feet, 9 feet, and 10 feet high. I am told that no similar growth of Indian Corn has ever been seen in this neighbourhood."

— THE NATIONAL AMATEUR GARDENERS' ASSOCIATION.—We understand that the annual dinner of this Association has been fixed to take place on Thursday, December 14th, 1893, in the Queen's Salon, Holborn Restaurant, at seven o'clock P.M. The medals, prizes, and certificates won during the year will be presented on this occasion. Mr. D.B. Crane, 4, Woodview Terrace, Archway Road, Highgate, N., is the Hon. Secretary.

— GARDENING APPOINTMENTS. — Mr. Walter Gibson leaves Steventon Manor Gardens, Whitchurch, Hants, on the 30th inst. for Sandown, Isle of Wight, as a grower of produce for market. Mr. W. Frost, gardener to W. Palmer, Esq, Westfield, Reading, has been appointed Mr. Gibson's successor at Steventon. Mr. J. C. Anderson, formerly of Metham Hall, Howden. has been appointed to the charge of the gardens at Saltmarshe Hall, Howden.

—— PUBLICATIONS RECEIVED. — We have to acknowledge the receipt of the following publications:—The second part of the "Transactions of the Massachusetts Horticultural Society" for the year 1892, from the press of the Society at Boston, U.S.A. The report of the Canadian Department of Agriculture regarding experiments on Grasses, conducted at their farm at Ottawa. The November number of the "Botanical Magazine," published by L. Reeve & Co., Henrietta Street Covent Garden.

TADCASTER PAXTON SOCIETY.—At the weekly meeting, held last Thursday evening, November 16th, a most excellent paper was read by Mr. Callum, B.A. The subject taken was "Efforts of Plants for Self-Prescrvation," illustrated by blackboard drawings. The essayist pourtrayed the hard battle many plants had to fight for existence; also described some of the peculiarities attending such plants as Sarracenias, Nepenthes, Venus' Flytrap, Sundew and others. A discussion followed in which many of the members took part. A hearty vote of thanks was passed to Mr. Callum for his most instructive paper. Mr. H. J. Clayton of Grimston Park will read a paper on "Hardy Fruit," this evening (Thursday), November 23rd.

—— CANKER IN FRUIT TREES.—This question now appears to be within measurable distance of solution. Is Nectria ditissima the cause or starting point of canker spots on the buds or spurs where it invariably commences? Or is it mites or insect life which cause the first rupture. This is the only point left in the discussion of interest to me. I have proved so far as my trees are concerned that I can cure canker by dressings of insecticides and lime, and so far as practical use is concerned that is all I care for, and leave others to enjoy their own opinions. I have now devoted about ten or twelve years to the subject, examining trees in all localities available, and my firm belief is still that insects start canker spots, and that fungus follows on the decaying wood.—

J. HIAM.

— Greenhouse Winter Flowers.—In a discussion that took place last week between members of the Kingston Gardeners' Association, it was pleaded by a member that numerous descriptions of what are very beautiful as well as most useful winter blooming plants, get very much put in the background, and are indeed comparatively neglected in some gardens, because so much of room and time is occupied with Chrysanthemums, the which are so easily grown. Double and single Chinese Primroses, Cyclamen, Bouvardias, Roman Hyacinths, Spiræas, Azaleas, Poinsettias, Zonal Pelargoniums, Heaths, Salvias, Deutzias, and Carnations, are but a few of the many plants which should be furnished in proper numbers in every good garden, whilst those more highly favoured should always have some Cypripediums and other easily grown Orchids. Even where there are no Chrysanthemums grown it was shown that with due attention to the needs of plants for forcing purposes a remarkable wealth of material was open to all.—D.

THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—It is announced that the above Society will hold the shows for 1894 on April 4th and 5th, July 11th and 12th, and September 12th and 13th. Mr. Chas. Stewart is the Hon. Secretary.

THE WEATHER IN THE ISLE OF WIGHT.—Mr. C. Orchard, Bembridge, I.W., writes:—"Winter has set in here early. Saturday, the 18th inst., opened with a very cold north-west wind and a drizzling rain. Towards evening it increased to a gale of wind and a drifting snowstorm. The thermometer registered 32°, and on the morning of Sunday, the 19th, the whole island was covered with snow, some of the drifts being 3 and 4 feet deep. The strong wind continued all Sunday, but the temperature rose a little, causing the snow to disappear by Monday morning. With the temperature so low, and the strong wind blowing, played sad havoc with such plants as Veronicas, Laurustinus, Fuchsias, Hydrangeas, and others that usually keep green and gay with flowers here up till Christmas, to say nothing of Chrysanthemums and other border flowers which are quite destroyed."

- OUR COUNTRY'S CHARMS.-A lady tourist sends the following note. "We had a delightful outing in September-Leamington, Warwick, Kenilworth, Oxford, and Blenheim. Of all the sights that struck me most was Ampelopsis Veitchi on everything and everywhere. Warwick Castle is a marvel of loveliness, and the peacocks make such a gleam of colour against and on the branches of the old trees. Blenheim is overpowering in size; the forest and ornamental trees and the pleasant head gardener, Mr. Whillans, struck me most there, also the extreme neatness of everything and the small force of men-we saw just a few. A large house of tree Carnations, pink, white and Winter Cheer charmed us. There are thirty-four houses all full, yet last December over £7000 worth of plants were sold out. We had Blenheim Orange Apples in perfection. Those who have not seen Warwick, Blenheim, and the old college gardens of Oxford should see them. I had no idea there was such wealth of loveliness in England. Kenilworth is only a ruin, but such a ruin that 'Brother Jonathans' come over in swarms to see it."

- THE QUEEN'S COTTAGE, KEW.—Our excellent transatlantic contemporary the "Garden and Forest," in the issue for November 8th, contains a well executed illustration of the Queen's Cottage at Kew, which stands in the centre of some forty acres of enclosed land, and is thickly planted with trees, and from which the public are excluded. It stands on the south-west side of the Royal Gardens, between them and the Old Deer Park, Richmond, also Royal property. Portions of the cottage grounds have evidently been tastefully laid out many years ago and planted with choice shrubs and trees by some competent landscape gardener. Even now, although the trees and shrubs were until recently left entirely to themselves, the grounds are full of pretty effects and delightful glimpses such as please the artist and lover of Nature. The wilder part is crowded with Beech, Chestnut, Oak, Lime, and other trees which, in places, rise straight out of a turf formed entirely of Bluebells, a glorious picture in the springtime, while other parts show, in tangled profusion, masses of Blackberry bushes, Brake and other Ferns, Daffodils, Ragged Robin, and other dwellers in English woods. The cottage was supposed to have been built for Queen Caroline, wife of George III., "who resided at Kew during at least three months in every year, and made besides a stay of three days in every fortnight at this his favourite spot." The Queen, it appears, was an ardent gardener.

- PLANTING.—Although it does but seem to be reiterating ofttold warnings, yet it is frequently needful just as much as ever to protest against the too common practice of planting everything too deep. Use seems to be so much overlooked that whilst the natural tendency of rooters to strike downwards, the essentials of good culture render the keeping of them so near the surface as possible generally desirable. This is specially the case with fruit trees and bushes, but it applies to most things because we want, under modern conditions of culture, to feed roots from the surface, whilst naturally they are induced to strike deep down into the soil. There can be no greater error in planting under any conditions than in burying the roots too deeply, whilst the nearer the surface, relative to the capacity, to have the roots covered with fine soil, the sooner do they become attached to the ground, and the more healthful is the resultant growth. There are some cases, especially where the soil is shallow or on stiff clay, practically to plant on the surface, but it is difficult always to make our practice fit in with our knowledge of what is best .- A. D.

WOOLTON GARDENERS' SOCIETY.—A meeting of the members of the above Society was held in the Mechanics' Institute on Thursday last, Mr. Carling presiding. Mr. J. Storey, Allerton Tower, read an instructive paper on "The Culture of Muscat of Alexandria and Madresfield Court Grapes." The propagation, pruning, training, disbudding, thinning the fruit, temperature and ventilation at the different periods of growth, watering, together with the formation of borders and the most suitable structures in which they ought to be grown, are fully dealt with. At the close an interesting discussion took place.—R. P. R.

- AGATHÆA CŒLESTIS.-Blue flowers are proverbially scarce, and as Agathæa cœlestis yields these in large numbers, it is, remarks an American contemporary, well worth cultivation for this reason alone. It is sometimes called the Blue Marguerite, and the name is apt, for in shape the flowers bear a strong resemblance to those of the common Marguerite, or Parisian Daisy. But here the likeness ends, for the plants are quite distinct in other particulars. The Agathæa is dwarf and shrubby, seldom more than 12 inches high, and very neat and compact in growth. The numerous leaves are small, rough to the touch, and of a deep rich green. The flowers, proceeding singly from the base of the leaves, are held erect above the foliage on slender naked stalks, the outer florets bright blue, and the disc an intense yellow. The plant is almost constantly in bloom out of doors in summer and under glass in winter. Even when its flowers are not wanted in winter it still requires gentle greenhouse warmth, since 3° or 4° of frost will kill it. Cuttings from young branches root readily in spring, and when grown on in small pots until mild weather they may be successfully used for bedding; and, again, if taken up carefully and potted early in autumn the same plants will, as before remarked, continue to bloom all through the winter and spring in the greenhouse.

- BIRMINGHAM AND DISTRICT AMATEUR GARDENERS' ASSO-CIATION .- On Wednesday, the 15th inst., Mr. Herbert Stone, F.L.S., delivered an illustrated paper, on "Roots and their Functions," before the members of the above Association, assembled at the Temperance Institute, Corporation Street. The chair was occupied by Mr. Leonard Brierley, J.P. (one of the Vice-Presidents), who heartily congratulated the Society on the exceptional progress it had made during the short course of its existence. Mr. Stone described the parts of various roots, their methods of pushing themselves through the soil, and of absorbing nourishment from it; and of the extraordinary property of the roots to exude an acid which had the effect of rendering soluble inorganic matter not usually soluble in water. He gave by means of the limelight lantern specimens of the different classes of roots, and gave figures to show the extraordinary amount of moisture that the plants absorb in the course of their growing period. A vote of thanks to Mr. Stone for his excellent paper, and to Mr. Leonard Brierley for presiding, terminated the proceedings. Messrs. E. D. Clarke, Gosling, Chapman, W. B. Griffin, Rees, and W. H. Wilks exhibited Chrysanthemum blooms, and awards were made accordingly. Those of the two former were exceptionally fine. The next meeting will be held on December 6th, when the President (Alderman Wm. White, J.P.) will deliver his address.

- CACAO IN TRINIDAD .- Mr. J. H. Hart, the Superintendent of the Royal Botanic Gardens, Trinidad, has recently been successful in transporting to Nicaragua a selection of the best varieties of Trinidad "Cacao." Cacao seed soon loses its vitality, and can only be safely transported long distances by placing it in a suitable position to germinate and grow on the voyage. On April 25th of this year, we learn from "Nature," Mr. Hart left Trinidad with a number of specially prepared cases containing plants, and seeds planted on the day of departure. The boxes in which the seeds were sown had not glass roofs, but were strongly latticed and covered with a moveable sail-cloth cover, which could be easily and rapidly fastened or unfastened, to give light or to protect from wind, rain, and sun. A frame covered with wire netting was fastened inside each case, so as to press upon the surface of the soil to prevent it shifting and causing the seeds to be disturbed. The seeds germinated ten days after planting, and on June 10th Mr. Hart reached his destination with more than 26,000 healthy plants, which were successfully put out in nurseries. A number of Cacao seeds were sown at Nicaragua to develop during the return voyage, and upon arriving at Trinidad good healthy plants were obtained from 98 per cent. of the seeds planted. These plants included two species entirely new to Trinidad, and their introduction may eventually prove of great benefit to the colony.

- WE regret to have to announce the death of Monsieur Antoine Besson, of Marseilles, on the 15th of this month. Monsieur Besson was sixty-eight years of age. He was a Knight of the Legion of Honour, and Vice-President of the Society of Horticulture and Botany.

- THE GALE IN SCOTLAND.—Writing under date November 18th Mr. R. P. Brotherston, Tynninghame, Prestonkirk, N.B., says :- "We have a fearful gale raging here, and great damage done to trees, both deciduous and coniferous.

- THE EAST LONDON FLORICULTURAL SOCIETY, that has up to now had to seek hither and thither for halls in which to make displays, has at last found a habitat at the People's Palace, which ought to be permanent. The large establishment in the Mile End Road ought to make itself the natural centre for all the amenities as well as the realities of East London life. The flower shows are a move in the right direction.

THE ORIGINAL HESSLE PEAR TREE.

I PROMISED to send you an account of the old original Hessle Pear tree. As there has been so much dispute about the name of the Pear, whether it should be Hessle or Hazel, I think when you have read this note you will agree with me it should be the "Hessle."

The tree is situated close to my house, in the garden of Mr. Riplingham, the owner. Mr. Riplingham's father and I have had many a talk about the tree. The family has been in the village for several generations, some 300 years. From what I could gather from him it seems to be supposed that the tree in its young state was brought over here by the Flemings, people who came up the Humber for the purpose of trading some 300 or 400 years ago. I have always said the tree could not be less than 300 years old.

The old trunk, which was some 3 or 4 feet in diameter, blew down, or at least the greater part of it, on the 1st day of August, 1890. It was quite hollow and decayed, with a large wasp's nest inside; but about 16 inches from the old trunk there is a young tree which has sprung up, no doubt a sucker from the original This young tree, 3 feet from the ground, is 37 inches in circumference; 6 feet from the ground it is $34\frac{1}{2}$ inches. When the old tree bore fruit as well as the young one I compared the two, and could not tell one from the other. This proves

that the old tree must have been a seedling.

Some time ago I had a conversation with one of the oldest men in the village. I said to him, "Robert, do you know the old Pear tree?" "Old Pear tree?" he repeated; "I should think I do. Why, I was born close to it. I worked for Mr. Riplingham's grandfather. I can remember the top of the tree blowing off one stormy night, and that will be nearly eighty years ago. Why, it was an old tree then. Old tree! I should think I do," and the poor old man's eyes fairly glistened

with delight.

I have been trying to find out the period when the Flemings traded in this neighbourhood. I wrote to Alderman Symon, the antiquarian of Hull, and he says that in 1290, the eighteenth year of Edward I., Toricius, a Fleming of York, was appointed to price the wine imported into Hull and to gauge the same. I find the same also stated in the History of Hull. So the Flemings must have been here at that time. In the year 1300 King Edward I. crossed over the Humber from Barton in Lincolnshire to Hessle on his way to the north, there being no ferry to Hull at that time. The first ferry from Lincolnshire to Hull was begun in 1316. From these facts I should say that the Flemings would often land at Hessle, and it is quite feasible, that they might have brought the Hessle Pear. I cannot find out any more about the old tree. -EDWIN LORD, Hessle.

[We are obliged by this communication. Hessle is the name to which this useful hardy Pear is entitled. M. Decaisne, a French authority, thought the Pear was of German origin, and says he preferred using the German name Haselnuss (hazelnut) to the French translation—Noisette. The tree as a seedling fruited at Hessle is the Hessle Pear.]

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 14TH.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair); Mr. McLachlan, Dr. Bonavia, Rev. W. Wilks, Prof. Church, Mr. Veitch, Prof. Müller, Prof. Green, Mr. Michael, and Rev. G.

Henslow, Hon. Sec.

Onions Diseased.—Mr. Massee reported as follows upon the samples brought to the last meeting :- "The Onions are attacked by a Botrytis, the same species as the one described by Prof. Marshall H. Ward in 'A Lily Disease' (Ann. of Bot., vol. ii.). The bulbs cannot possibly be saved now, the fungus having spent its active period on the leaves; while the hypbæ are now passing into the bulb to form sclerotia. If the foliage had been sprayed with a fungicide the mischief would have been kept within bounds. The diseased Onions should be burnt and not thrown on to the manure heap."

Daffodil Bulb Diseased.—He also reported upon the specimen

brought by Mr. Wilks, that a saprophytic fungus was now present, which had followed a disease induced by some other unascertainable

Pears Diseased.—Mr. Massee sent the following additional remarks

upon the fruit reported upon at the last meeting:-"The fungus attacking the Pears first appears upon the leaves, and from thence it passes on to the fruit. The tree should have been sprayed with a fungicide previous to the appearance of bloom, and once or twice after the fruit had set. Bordeaux mixture has been proved effective." A unanimous vote of thanks was given to Mr. Massee for his interesting and valuable reports.

Job's Tears (Coix lachryma, L.).—Mr. McLachlan exhibited a specimen of this Grass, grown in Devonshire in the open air. It is remarkable for the stony involucres, often used as beads. Prof. Churchdrew attention to another species, C. gigantca, Roxb., which is cultivated in the Khasia hills, and elsewhere in Bengal. C. lachryma is not cultivated, though the grain of wild plants is eaten. Prof. Church's analysis of the grain of C. gigantea shows that it contains 16.8 albuminoids, and 59.9 starch, &c., so that its "nutrient value" is very high, being 90 per cent. ("Kew Bul.," 1888. p. 267.)

Sphæria Robertsii.—Mr. James Veitch exhibited specimens of this

well known parasitic fungus of New Zealand issuing from the neck of a large caterpillar (Hipialis virescens). It is called aweto or "vegetable caterpillar." The latter frequents particularly, if not quite exclusively, the Rata tree (Metrosideros robusta), and when the pupa burrows into the ground at the foot of the tree, the spores of the fungus attack it, the mycelium ramifying through the body, while the stem bearing the sporiferous asci issues erect from between the folds in the neck of the caterpillar.

Planorbis Shells Split.—Mr. Wilson sent specimens split transversely, with the following observations:—"The shells are deposited in large numbers on the bent-down rushes at the water's edge of one of our ponds at Oakwood, Wisley. There are no signs of rats near. I much wish to know what cuts them, whether beast or bird." It was suggested by Mr. Michael that if the shell lay half in water a severe frost might possibly have effected it; but they appeared to be quite fresh shells Mr. M'Lachlan suggested herons as having perhaps done The cause of the peculiarity, however, was recognised generally as obscure.

Winter Moth.—Mr. Wilson sent the following observations on this insect:—"On the 3rd of this month there were fifty-four females on the greased bands on our fruit trees at Oakwood. They do not usually appear so early with us. Great quantities of both females and males have been caught since the above date. Perhaps the wood and ponds are attractive to them. We have so few at Weybridge that it is not worth while to band the trees."

Clitoria Ternatea, peloric.—Dr. Bonavia showed photographs and a coloured drawing (by a native) of this plant from India, illustrating transitions from the normal "Pea-like" blossom to the regular or peloric condition, much resembling a Periwinkle. The colour is a bright blue.

It appears to be not uncommon in this species.

Casuarina dimorphic.—Dr. Masters exhibited a specimen received from Baron Von Müller, in which a portion had developed sharp-pointed leaves exactly similar to the pointed-leaved form of Juniperus, which is often dimorphic in the same way. Mr. Henslow mentioned that these changes are paralleled by the Thuja-leaved forms of Veronica, which grow at great altitudes in New Zealand, and observed that analogics seemed to suggest varying degrees of drought or moisture as likely to be the direct cause of the different kinds, respectively.

Wheat-eared Sweet William.—Dr. Masters also showed a specimen of this well-known malformation, in which while the flowers are suppressed, the small bracts at the base become multiplied excessively. Mr. Veitch observed that it is very common and difficult to eradicate.

No cause could be suggested for its occurrence.

Canna, Madame Crozy.—Dr. Masters observed that it has been stated that this variety of Canna was really a very old form, having been figured in Loddiges' Cabinet, No. 449; but, as he pointed out, though the colours were similar, the petals having a yellow rim, the size was very different, the modern form very probably having originated from that older variety.

Germinating Cocoa-nut.-Dr. Masters showed a drawing of the globular cotyledon developed within the cavity and applied against the edible endosperm. With reference to its power of secreting a ferment to digest the food, Prof. Green remarked that he had not succeeded in isolating the ferment: but the epidermis of the cotyledon was quite of the character suggesting the presence of one. He noticed a fatty acid present, apparently indicating reactions produced by some ferment.

PROTESTS AT SHOWS.

I THINK exhibitors in many cases do not properly understand on what grounds a protest can be successful. It is not intended as a means of securing a revision of the Judge's award in matters of mere opinion or pointing, but merely as a safeguard against fraud, non-compliance with the terms of the schedule, questions as to distinctness or otherwise of varieties, or anything of an unexpected nature not within the knowledge of the Judge. - SECRETARY.

CHRYSANTHEMUM LORD ROSEBERY.

New incurved Chrysanthemums are not so numerous as those of the Japanese type, and therefore when a variety of merit is brought forward it is generally welcomed. Mr. Robert Owen, Castle Hili Nursery, Maidenhead, has on many occasions raised and introduced some good incurved varieties, as well as others, and one of his latest is Lord Rosebery, figured in the illustration (fig. 68). It is an English-raised seedling. An award of merit was adjudged for it when exhibited by Mr. Owen at the meeting of the Royal Horticultural Society on November 14th. It has also been certificated at Birmingham. In colour the flower somewhat resembles Miss Violet Tomlin, being bright violet purple, passing to purplish rose with lilac tips; but it is much larger than the variety mentioned, and when well grown will prove a decided acquisition for exhibition purposes. The plant is a moderately vigorous grower, and has very distinct foliage. The bloom from which the engraving has been prepared was grown by Mr. Owen, who informs us that the variety will be distributed next year.

GRASSENDALE SHOW.

THE handsome silver cup, valued at 10 guineas, and presented by the President (A. L. Jones, Esq., Oatlands, Aigburth), to be won twice in succession or three times in all, has been secured, as last year, by Mr. Donald Forbes, gardener to Alfred Holt, Esq., Crofton, Aigburth, with twelve Japanese and twelve incurved. It will be remembered that Mr. Forbes won with forty-eight cut blooms a week ago, and singular to relate, was first in the same class last year.—R. P. R.

THE N.C.S. AND ITS CERTIFICATES.

ALTHOUGH up to the date of the Aquarium Show the Floral Committee of the N.C.S. had awarded twenty-six first-class certificates to exhibitors of Chrysanthemums, "A Mummer" (page 444) may rest assured that a very much larger number have narrowly escaped the distinction. Having been intimately connected with the Society from its commencement as a National one, and a frequent attendant at the meetings of the Floral Committee, I can confidently say that never has there been such a rigid system of selection as during the past year or two, and it really seems as if the standard now required could not be anyhow raised higher. The light anywhere in November, of course, is a disadvantage, but it is consoling to find in the R.H.S. report in last week's Journal that the Floral Committee of that venerable Society are also sometimes placed under a similar disadvantage at the Drill Hall.

CHRYSANTHEMUM CHARLES DAVIS.

As "Querist" (page 445) appears to know there are but few Chrysanthemums in which the colour can be termed fixed. A great deal depends upon the bud selected, the age of the bloom, and in many cases whether the plant is flowered in town or country. I have seen large numbers of this variety during the past few weeks in almost every shade of yellow, but its proper chromatic description is canary yellow suffused with a warm rosy bronze. It is the variety that should be certificated, not any particular tone of colour that the variety may assume; and therefore if presented by two different growers, one having small undeveloped blooms of orthodox hue, and the other large well grown examples in which the colour is less pronounced, the award must justly go to him whose flowers exhibit the greatest skill in cultivation.—P.

CHRYSANTHEMUM BEAUTY OF EXMOUTH.

This variety has not been seen this season in such magnificent form as shown last year. The cause is not far to seek. Beauty of Exmouth is a "wet season" variety, and the past hot weather ripened the wood too much. Most growers have overdone this variety by giving it the same treatment accorded to the majority of the exhibition kinds. The best blooms are produced from strong cuttings rooted in March and plants topped in May, and giving at least 10-inch pots (inside diameter). The object is to reduce the number of petals. The plants should be fed well, especially soon after the buds are taken. Every effort should be made to get what must be avoided in Mrs. Harman Payne and many others—viz., coarseness.—W. J. G.

WHITE VIVIAND MOREL.

I MUCH regret having to differ from those eminent authorities mentioned in last week's Journal (page 445), who considered it would be safe to exhibit blooms of white and pink Viviand Morel as distinct varieties. Last spring I obtained plants of Mrs. W. R. Wells rather late, and everyone gave fine, deep pink blooms. My ordinary stock gave pure white blooms from the earliest crown buds and pink blooms from terminals. If white and pink Viviand Morel can be exhibited as distinct varieties, then the yellow Chas. Davis could be exhibited as "Mrs. Brown," and the bronze as Chas. Davis. When a white sport from Brown," and the bronze as Chas. Davis. When a white sport from Vivand Morel is fixed, the same as "Mr. C. E. Shea." the yellow sport from Mdlle. Lacroix, or Chas. Davis from V. Morel, then, and not until then, should it be safe to show white and pink Viviand Morel as distinct varieties. varieties. Nearly all the pink varieties give (not invariably) pure white flowers from the early buds; as prominent examples I mention Etoile de Lyon and Duchess of Devonshire. The early buds of Louise produce pure white flowers, the later being pink. Mrs. E. G. Hill from crown buds is crimson bronze, from terminal a beautiful clear yellow. many of the Japanese vary not only in colour but in shape or form as well. It simply depends on the different times the buds are "taken."—W. J. GODFREY.

NEXT YEAR'S CHRYSANTHEMUM SHOWS.

THE Committee of the Kingston and Surbiton Chrysantbemum Society announce that their next year's Show will take place on November 13th and 14th. What is determined by the few larger Shows such as Kingston and the National of course materially governs the dates of the smaller Shows, of which there are so many within twenty miles of London, and none of whom wish, if it can be avoided, to conflict with the giants. If the National fixes upon the same dates as Kingston, and it will probably be so, it will at least leave ten days in November that may largely be utilised by the smaller Shows prior to the 13th, whilst very many may perhaps think that a week later—the 20th and following days—rather too late.

The fixing of dates is very much of a lottery so far as securing the best flowers is concerned; but there can be no doubt but that a little early gives better displays than a little late. The present year demonstrated that the Japs were never better than just at the time of the leading shows, and that was fully six days earlier than next year's chief exhibitions may be fixed for. Six days is almost an age in the keeping of fine blooms, especially if the weather be at all damp. Every grower knows that retarding flowers that have reached the maximum of development is far more difficult than is the pushing them on in gentle warmth, if found needful. Of course the coming year's dates will be exceptionally late if the Kingston selection be generally followed but they will productly account to the second of the secon lowed, but they will gradually come a date forward again for several years. Without doubt the 9th and 10th, literally the middle of the second week in November, seems to be about the best average dates. As the 6th and 7th would be too early, and the 13th and 14th rather late, the choice seems in favour of the former. We shall watch the results next year with exceeding interest, but still so much of these results must be contingent upon the nature of the next growing season.—D.

AT CHILWELL.

For a number of years Messrs. J. R. Pearson & Sons have been celebrated for their annual show of Chrysanthemums, and this is no Upwards of 2000 plants are arranged in a lofty structure about 90 feet long and 30 feet wide, and the plants look splendid. They are placed in one broad central bank with a narrow border round next the sides of the house. The collection is kept well up to date by Mr. C. E. Pearson who has this department under his control, all the latest introductions being represented. Owing to the earliness of the season the flowers at the time of my visit were commencing to fade, whereas in an ordinary year they would have been at the summit of their beauty. Though some few may have passed away there still remains a display rich in colour and grand flowers well worthy a long journey to see. Messrs. Pearson are to be congratulated on having such a fine house in which to show their plants are in which the rich that it is the state of which to show their plants, one in which the visitors can walk round in comfort and see every plant and every flower to the fullest advantage. I noted a few of the varieties which appeared to be the most praiseworthy, but doubtless several were missed, as my visit was unformatically being the companion of the c tunately a hurried one.

Particularly striking, immediately on entering, is a grand bright yellow Japanese, named Mons. Pankcoucke, the flower of which is of fine shape and build. Henri Jacotot fils is a chestnut-red-coloured fine shape and build. variety, the florets of which have a yellow reverse, which is extremely attractive. An excellent hairy petalled kind is found in Vancauson Testout. This is a well-formed flower, and is of a bright pink colour, which should make it popular. A grand bloom is Mons. Auguste Perrin, somewhat after the style of Viscountess Hambleden, but of a delicate pink shade. The flower is massive, and almost faultless in shape. Sarah Hill is a clear vallow, the broad florets of which are Sarah Hill is a clear yellow, the broad florets of which are lightly with lilac at their tips. The beautiful blooms of Primflushed slightly with lilac at their tips. rose League are now too well known to readers of the Journal to need any description from me, as also are Lord Brooke, Mrs. Falconer Jameson, Puritan, and Charles Davis, each of which was seen in superb condition. Two bright yellow coloured kinds of merit are Charles Blick and Golden Ball, the latter of which is grand for affording cut blooms. Growing only 2 feet high, it might with advantage be used for decorative purposes. For this latter purpose Ryecroft Glory, clear yellow, is perhaps unsurpassed; and Sydenham Terra Cotta is a kind which might be grown with advantage. Both are free blooming, and the former especially is one of the most useful for October flowering.

A charming variety is found in Mrs. Libbie Allen, and the enormous blooms of Mrs. C. Harman Payne attract universal attention and admiration. Many superb flowers of Miss Anna Hartshorn are to be seen, and also of Florence Davis, W. H. Lincoln, and Viviand Morel. The dwarf habit and brilliant colouration of G. W. Childs render it a variety of the utmost utility. Mrs. Robt. Craig is a good incurved of a delicate rose colour. The bloom is deep with somewhat pointed florets. A substantial flower is Miss Ada MacVicar, and the primrose yellow flowers of The Tribune last in good condition for an unusually long time. A kind which promises well is Miss Maud Pearson, delicate pink in colour, as also does The Queen, a white variety, the petals of which are splashed with purple. Amongst the numerous other varieties noticed were Colonel W. B. Smith, White Louis Boebmer, and Baron Hirsch.—NOMAD.

of the Society ten years ago has been

well maintained, the entries in almost all classes and divisions having increased in

NATIONAL CHRYSANTHEMUM SOCIETY.

THE General Committee of this Society held a meeting on Monday last at Anderton's Hotel, when Mr. R. Ballantine occupied the chair.
Most of the business was of a purely formal nature, and the correspondence read related to proposed alterations in various classes, all of which were referred to the Schedule sub-Committee for consideration. The awards made by the Arbitration Committee at the November Show were then submitted for confirmation, and comprised silver-gilt medals to Mr. Robert Owen, Mr. H. J. Jones, Messrs. Cutbush & Sons, and B. S. Williams and

Son; silver medals son; silver medals to Messrs. Shuttle-worth & Co., Mr. H. Berwick, Mr. Godfrey, Messrs. H. Cannell & Sons, and Messrs. J. Laing and Sons; bronze medals to Messrs Cannell and Messrs.Cannell and Mr. W. E. Boyce for their exhibits of flowers and vegetables. The Chairman announced that the Show was quite a success both as regards the attendance of the public and the quality of the exhibits.

The Secretary reported that income to the amount of £525 11s. 8d. had been received up to date, the principal items being £142 19s. 6d. for annual subscriptions, £13 13s. 6d. donations. £39 7s. affiliated societies' fees, £31 12s. 6d. for medals, and £4 4s. for sale of catalogues. On the subject of the shows for 1894 it was intimated that they will probably be the same as those for the present year, viz., one in September, held by the Aquarium Company, towards which the Society will contribute money prizes for Chrysanthemums; one in October, November, and December. Some dis-cussion thereupon ensued as to the advisability of finding a fresh place for the Society's shows, but the proposition was negatived.

The annual dinner, as already announced, will be held at Anderton's Hotel on the 30th inst., and all arrangements for it

have now been completed. Sir Edwin Saunders will occupy the chair. Twenty-four new members and Fellows were elected, making a total for the year of 150.

Mr. C. E. Shea was prevented by indisposition from reading his promised paper on "Judging," but had sent it for the Secretary to read if agreeable to the members. Mr. Beavan moved that the reading of it be deferred until Mr. Shea was well enough to attend personally, as the state of the fair to the

thought any discussion arising upon the subject would not be fair to the author, and this view received the support of the members present.

Questions were raised as to the advisability of ladies being invited to be present at the annual dinner, the extension of the radius in the metropolitan classes and the meeting closed at a rather earlier hour

metropolitan classes, and the meeting closed at a rather earlier hour than usual

CHRYSANTHEMUM SHOWS.

HULL.—NOVEMBER 15TH AND 16TH.

As briefly mentioned in our last issue, the annual Chrysanthemum Show of the Hull and East Riding Society was held in the Artillery Barracks at that town on the above dates. The Society is one of the most enterprising and at the same time one of the most successful in the country, and as regards quality no better exhibits can be seen anywhere. The advance which has been manifest every year since the formation

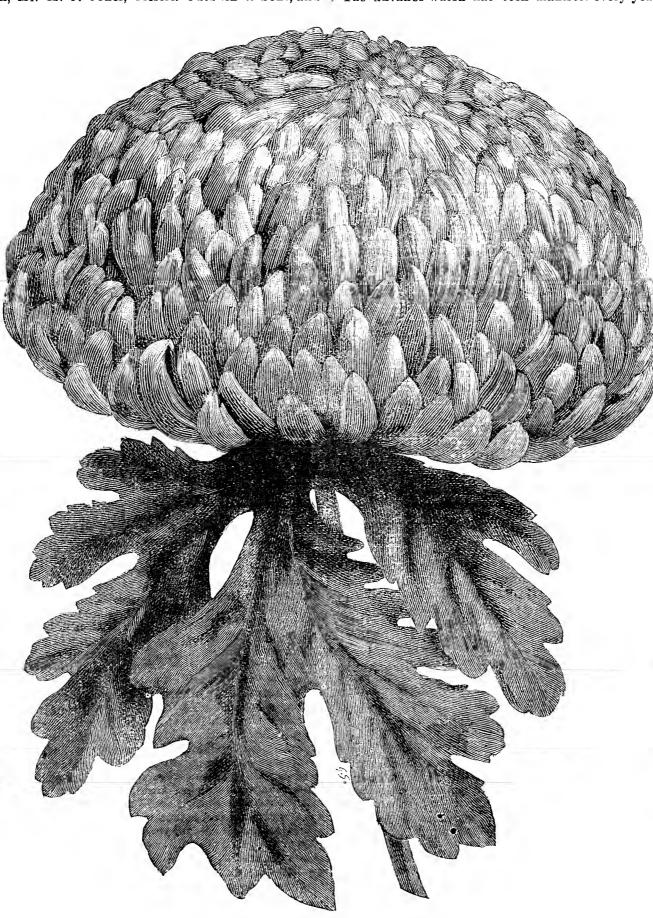

FIG. 68.—CHRYSANTHEMUM LORD ROSEBERY.

Another novelty introduced this year was a class for twenty-four blooms Japanese, distinct, to be arranged with or without foliage of any kind as the exhibitors chose. The object of this class was to introduce a less formal system of arrangement than that now in vogue, the merits of the flowers being primarily considered, but artistic staging was a necessary adjunct. The competitors numbered three, and the first prize stand left little to be desired either in quality of the flowers or in the exquisite taste displayed in arrangement. The prizes, which included several handsome vases and cups figured in the Journal of Horticulture for October 12th (page 339), amounted in value to appeared of \$200 in for October 12th (page 339), amounted in value to upwards of £200, in consideration of which it is by no means surprising that the entries should be so large, the quality so high and the competition so keen. The management of the Exhibition, in the hands of Mr. R. Falconer

number, totalling 430—the highest yet attained. The classes for lady competitors blowed a slight depreciation, but the quality was grandly upheld. The in-crease was most noticeable in the division for plants, once the weakest part of the show. The groups, for which the Hull Show has long been celebrated, were quite up to the usual standard, and that is a high one. An innovation, in the shape of a class for a group of foliage plants, arranged for effect, brought but two exhibits, both these peing magnificent examples. The section Japanese contained many superb blooms, and the incurved were amongst the very finest that have been staged at any show this season. As evidence of the advance made by this Society we give the number of entries in the classes for cut blooms this and last season:—Ex-hibits in 1892,151; in 1893, 194, an increase of 43. Number of blooms staged in 1892, 1947; in 1893, 2728, an advance of 781. In the plant section, exclusive of groups, the ex-hibits in 1892 were 55; in 1893, 88, an increase of 33; and the plants staged were, in 1892, 188, and in 1893, 293, an advance of 105.

Jameson, Chairman of the Society, Messrs. E. Harland and J. Dixon, the Honorary Secretaries, and the Committee were thoroughly carried out, and reflected much credit on all those concerned. Especially praiseworthy was the promptitude with which the Judges commenced their duties, an example which might well be followed by numerous other societies throughout the kingdom. We append a list of the prizewinners in the principal classes, space not allowing of the whole being mentioned.

Groups and Trained Plants.-In the class for a group of Chrysanthemums interspersed with foliage plants, arranged in a space not exceeding 100 square feet, and with the first prize of which went a silver challenge cup, which must he won three times before becoming the absolute property of anyone, there were four competitors, the premier award going to Mr. Coates, gardener to W. Wheatley, Esq., 7, Milton Terrace, Anlaby Road, Hull, for a charming arrangement. The Chrysanthemums were magnificent examples of high culture, and the foliage plants were intermingled in a highly artistic manner. Mr. G. Cottam, jun., Alma Gardens, Cottingham, was a good second, his blooms being scarcely so well finished as those of the above named. The third prize went to Mr. Murchison, gardener to F. B. Grotrian, Esq., J.P., West Hill House, Hessle, and the fourth to Douglas C. Joy, Esq., Wetton Hill, Brough. For a group of miscellaneous plants arranged for effect in a space of 100 square feet, Mr. J. Wilson, gardener to J. Reckitt, Esq, Swanland Manor, was deservedly placed first. The plants, which included amongst others Crotons, Calanthes, Cypripediums, Asparagus and Dracænas, were perfectly grown specimens, in the placing of which really exquisite taste had been displayed, the group producing a light and graceful effect which left nothing to he desired. Cottam's exhibit, which took the second prize, Chrysanthemums, Liliums, and Palms were most prominent, all being well grown, clean, healthy looking plants.

Mr. Hemming, gardener to E. Leetham, Esq., Beech Holme, Newland, was placed first for three trained specimen plants, exclusive of standards, with highly creditable examples of Mrs. G. Glenny, Mrs. Rundle, and Mrs. Dixon, each of which carried handsome blooms. Mr. Coates was a good second, and Mr. H. H. Taylor, Newland, third. For three standard trained plants Mr. Hemming was again first, staging precisely the same varieties as in the class previously named. Mr. Mason, gardener to Colonel A. K. Dibb, Kirk Ella, being second, and Mr. H. H. Taylor third. For three pyramid trained specimens the same exhibitor who took the premier position in the two classes above mentioned was first with good examples, the second position being again taken by Mr. Mason.

In the class for six plants, bush grown, not formally trained, Mr. W. Goodhill, 32, Stanley Street, Hull, was first with excellent examples of W. H. Lincoln, Val d'Andorre, Mons. Bernard, Viviand Morel, Avalanche, and Margot. Mr. H. H. Taylor was an excellent second; and Mr. T. Smith, Norwood Nursery, Beverley, a fair third. Mr. W. Goodhill was also first for three bush-grown plants with Val d'Andorre, Mons. Bernard, and Avalanche, all in very fine condition. The second and third prizes were accorded to Messrs. Hemming and H. H. Taylor in the order of their names. There were ten competitors in the class for six "cut-backs," any varieties, and the competition was close. Mr. H. H. Taylor gained the premier award, staging grand plants of Viviand Morel, Florence Davis, Sunflower, and Gloire du Rocher. Mr. Coates was second. Mr. Willey, gardener to C. J. Ringrose, Esq., Cottingham Grange, third.

The three classes next following were restricted to amateurs or those employing only one gardener, and the competition ran high. For three bush-grown plants, Mr. F. Pape, Butcher Row, Beverley, was first; Mr. Coates second; and A. Mayfield, Esq., Beverley Road, Hull, third. Mr. Coates was first for three trained specimens, A. Mayfield Esq., being second, and Mr. R. Thirsk, Grovehill Road, Beverley, third. In the class for one trained specimen, Mr. Thirsk took the premier position, A. Mayfield, Esq., being second, and Mr. Coates third.

In the class for twelve table plants in pots not exceeding 6 inches

In the class for twelve table plants in pots not exceeding 6 inches in diameter, Mr. J. Wilson was a splendid first, Mr. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, being second, and Mr. Hemming third. Mr. Hemming was first with six plants suitable for table decoration; Mr. Lawton, gardener to Colonel W. H. Harrison Broadhy, Welton House, was a very close second; and Mr. Cottam third.

Blooms.—As has been said this section of the Exhibition was represented by numerous superb examples. One of the principal classes was for twenty-four incurved in not less than eighteen varieties, and not more than two of any one kind. To the first prize a silver cup was added, and the competition between the seven stands staged was close, the premier position eventually being assigned to Mr. Lees, gardener to A. Bevan, Esq., Trent Park, New Barnet, who staged-Golden Empress of India, Lord Alcester, Hero of Stoke Newington, Golden Empress, Lord Wolseley, Princess of Wales, Hero of Stoke Newington, Lord Alcester. Middle row: Princess Teck, Violet Tomlin, Mrs. Coleman, Lady Dorothy, Miss M. A. Haggas, Lord Wolseley, Mrs. Coleman, and Lady Dorothy. Front row: Prince Alfred, Empress of India, Nil Desperandum, Jeanne d'Arc, Robt. Cannell, John Lambert, John Salter, and John Doughty. All these blooms were grand and perfectly finished. Mr. Shoesmith, gardener to M. Hodgson, Esq., Shirley, Croydon, was second with fine though somewhat flatter flowers. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, was third with flowers which lacked the finish so noticeable in the two previously named. There were five stands competing in the class for twelve incurved, distinct, the quality of the blooms being first rate throughout. Mr. Musk, gardener to Lord de Ramsey, Haveringland Hall, Norwich, was placed first with-back row: Princess of Wales, Violet Tomlin,

Guernsey Nugget, Camille Flammarion. Middle row: Miss M. A. Haggas, Novely, John Salter, Alfred Lyne. Front row: Mrs. Heale, Jeanne d'Arc, Empress of India, and Princess Teck. This was a superb exhibit in every way worthy of the high position accorded it. The second prize went to Mr. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, whose stand was but few points behind that of Mr. Musk, and the third to Mr. Blair with creditable blooms. For twenty-four Japanese, distinct, Mr. Shoesmith was accorded the highest position and took the silver cup given with the first prize. The flowers exhibited were perfect in finish and weighty. The following varieties were represented—back row: Viviand Morel, Mdlle. Marie Hoste, Edwin Molyneux, Mrs. E. D. Adams, Mrs. C. Harman Payne, Madame Calvat, Charles Shrimpton, Etoile de Lyon. Middle row: W. W. Coles, Gold en Wedding, Ruth Cleveland, Colonel W. B. Smith, Mrs. Wheeler, G. C. Schwabe, Mrs. E. W. Clarke, Mons. Bernard. Front row: Mdlle. Thesese Rey, J. Shrimpton, Lord Brooke, W. H. Atkinson, W. H. Lincoln, Le Verseau, Wm. Seward, and Sunflower. Mr. Heany, gardener to H. G. Schintz, Esq., Mossley House, Liverpool, was second with a heavy stand, Mr. Musk being a good third. Mr. Lees was first for twelve Japanese, staging splendid blooms. A fine second was found in Mr. Musk, the third position going to Mr. Shoesmith.

One of the novelties to which brief reference was made in the introduction was for twenty-four Japanese, arranged with any foliage, according to the taste of the exhibitor, on a table space not exceeding 6 feet in length by 2 feet 6 inches in width. The object of this class says the schedule was to introduce a more tasteful manner of staging highly developed blooms, therefore first quality blooms were indispensable. At the same time artistic arrangement was an essential, and was duly considered by the adjudicators. The first prizewinner (Mr. Musk) had grasped the full meaning of the schedule, and arranged a superb exhibit. From a groundwork of heautifully green Fern arose the splendid Chrysanthemums interspersed in a highly artistic manner with light and elegant foliaged Palms. Amongst the best of the varieties utilised were Sunflower, Viviand Morel, Florence Davis, G. C. Schwabe, Edwin Molyneux, and Avalanche. The second prize was awarded to Mr. Wilson with a highly creditable arrangement, and the third to Mr. Jarvis, gardener to B. Whitaker, Esq., Cliff House, Hessle. In the class for six bunches of incurved, Mrs. George Rundle, Mrs. Dixon, and George Glenny, two bunches of each, three blooms to constitute a bunch, Mr. Goodhill was a good first with clean, shapely examples; Mr. Waterhouse, gardener to H. Witty, Esq., The Wellingtonias, Cottingham, being second; and Mr. Wells, Earlswood Nurseries, Redhill, third. Mr. Blair was an excellent first in the class for six incurved, one variety, with handsome blooms of John Salter; Mr. Musk being second with Madame Darrier; and Mr. Pike, gardener to C. H. Wilson, Esq, M.P., Warter Priory, third with John Salter. There were ten competitors in the class for six Japanese, one variety, some magnificent flowers being Mr. Shoesmith, with superb Colonel W. B. Smith, was first; closely followed by Mr. Leadbetter, with charming, refined examples of Madame Baco; the third prize being awarded to Mr. J. W. Backhouse, Beverley, with highly creditable blooms of Avalanche. Mr. Mason, gardener to A. Smith, Esq., Woodleigh, Hessle, was first for twelve large Anemones, in not less than six varieties; Mr. Davidson, gardener to R. Jameson, Esq., J.P., East Ella, was a good second; and Mr. Burrows, gardener to Sir Henry Bennett, Westlands, Grimsby, third. Mr. Mason was again first in the class for twelve Japanese Anemones. Mr. Burrows was second. For twelve reflexed, in not less than six varieties, Mr. Davidson was first with excellent blooms. second and third prizes were awarded to Messrs. Heany and Burrows in the order of their names.

Mr. Walker, gardener to Colonel Stracey Clitherow, Hotham Hall, Brough, was accorded the premier position in the class for twelve sweet scented Chrysanthemums, Mr. Drewery, gardener to Edward Harland, Esq., The Sycamores, Cottingham, being second, and Mr. W. Wells third. For twelve hairy flowered varieties Mr. G. E. Smith, Floral Cottage, Paull, was first with charming blooms, and Mr. W. Wells second. Mr. Drewery was a good first for twelve bunches of Pompons, Mr. Hemming being second, and Mr. G. E. Smith third. For twelve bunches of singles with foliage as grown Mr. Drewery was first, Messrs. Walker, and G. E. Smith being second and third respectively. Mr. Crook, gardener to the Dowager Lady Hindlip, Hadsor House, Droitwich, was first in the class for three blooms of Beauty of Exmouth, showing creditable examples, Mr. Walker being second.

The only competitor in the class for a table of bouquets, wreaths, sprays and buttonholes, to be composed of Chrysanthemums and any kind of foliage, was Mr. H. H. Taylor, Newland, who was deservedly awarded the premier position for a charming and highly artistic exhibit. The same exhibitor was first for a hand bouquet with a beautiful example of taste and skill, Mr. Cottam being a good second, and Mr. Backhouse third.

The class for twelve incurved, distinct, for growers residing in Lincolnshire within twenty miles of Hull or anywhere in the East Riding of Yorkshire, brought seven stands, and the first prize was awarded to Mr. Burrows. Messrs. Jarvis and Pike were placed second and third as mentioned. In the class for twelve incurved, in not less than nine varieties or more than two blooms of one kind, subject to the same residential qualifications as the previous class, Mr. Davidson was first, Mr. J. Clark, Cromwell Road Nurseries, Grimsby, second, and Mr. Lawton third. For twelve Japanese, distinct, with the first prize of which went a silver cup, there were ten competitors, Mr. Burrows being eventually accorded the premier position. The second prize went to Mr. Walker with small refined flowers, and the third to Mr. Willey,

gardener to C. J. Ringrose, Esq., Cottingham Grange. In the class for twelve Japanese, in not less than ninc varieties or more than two blooms of any one kind, Mr. Willey was first, Mr. Walker second, and Mr. Jarvis third. The two following classes were only open to amateurs and those employing one gardener with no casual assistance whatever. For twelve incurved, in not less than six varieties, Miss Veal, Westland Corner, Bargate, Grimsby, was placed first, J. A. Hudson, Esq., Long-croft, Beverley, second, and Mr. Waterhouse third. Miss Veal was again first for twelve Japanese in not less than six varieties, Mr. Waterhouse being second, and J. A. Hudson, Esq., third.

The leading incurved bloom in the open classes was a superb example of Lord Alcester shown by Mr. Lees, and the premier Japanese a perfect flower of Chas. Davis, exhibited by Mr. Heany. In the amateurs' division the leading incurved was Jeanne d'Arc, in finc form, staged by Mr. Stanley, and the best Japanese a magnificent Stanstead White, shown

by Mr. Backhouse.

In the amateurs' classes for cut blooms the competition was remarkably keen, the blooms staged being highly creditable to their respective growers. For twelve incurved in six varieties, with the first prize of which was given a silver cup, Mr. A. W. Stanley, De-la-Pole Estate, Newington, Hull, was awarded the premier position. A silver cup also went with the first prize in the class for twelve Japanese in ninc varieties, Mr. W. H. Clarke taking the leading position. Plants in pots were also extensively shown in this section, and the greatest credit is due to the growers for the good quality of their exhibits. The number of exhibits in the classes for table decorations, bouquets, and sprays, open to ladies only, showed a slight decrease from those of last year; the quality, however, was excellent.

Miscellaneous exhibits were not very numerous, but the quality throughout was exceptional. The Hull Corporation arranged a grand group which would have gained a position had it been staged for competition, the Chrysanthemums being fine and the foliage plants clean and healthy. Table plants, in magnificent condition, were also staged by the Corporation. Messrs. E. P. Dixon, seed merchants, Hull, had a prominent stand of foliage plants and fruits. Mr. R. J. Woolton, New-Messrs. E. P. Dixon, seed merchants, Hull, had a land Toft Nursery, Hull, one of Chrysanthemums and Ferns; Mr. J. W. Wilson, F.R.H.S., South Cave, one of Orchids, Ferns, and Palms; the Rev. W. M. Bennett, M.A., Elloughton, one of Pompons, and Mr. Wm. Martin, seedsman, Market Place, Hull, one of bulbous roots.

BIRMINGHAM.—NOVEMBER 15TH AND 16TH.

A MAGNIFICENT exhibition was held in the Town Hall on the dates named. Birmingham has long been noted for its splendid autumn shows, but taking all the exhibits into consideration—Chrysanthemums, miscellaneous plants, fruit and vegetables-no finer exhibition has ever been held than the present one. Nowhere can keener competition be found in the cut bloom classes. The groups of Chrysanthemums in pots and the specimens made a fine display. Primulas were magnificent, and so were the Grapes as well as the hardy fruit. The arrangements were perfect, under the direction of Mr. Hughes, ably assisted by an efficient Committee.

Plants were numerously shown and in grand condition. For nine large flowered, Japanese excluded, £5 was offered as first prize. Mr. Dyer, gardener to Mrs. Marigold, Edgbaston, was an easy first with specimens not too formally trained, carrying about forty blooms each and splendid foliage; John Salter, Barbara, and Prince Alfred were especially noticeable. Mr. J. Maldrum, gardener to G. Cadbury, Esq, Selly Oak, was a good second, and Mr. A. Cryer, gardener to J. A. Kendrick, Esq., Edgbaston, third. Messrs. Dyer and Maldrum were placed in the same position for six large flowered with meritorious examples.

For three Japanese Mr. Dyer was again successful, having Florence Davis, W. H. Lincoln, and Viviand Morel in admirable condition. Mr. Maldrum was second. Messrs. Dyer, Maldrum and Cryer were placed in the order named for a single specimen, incurved variety. Mr. Dyer, with a grand plant of Florence Davis, won the premier award for single specimen Japanese, Mr. Maldrum following with Val d'Andorre. Mr. J. Maldrum won with three Pompons, showing freely flowered examples of Golden and White Cedo Nulli and Sœur Melanie. Mr.

Cryer was second.

Groups of Chrysanthemums were largely contributed. In the class for a group of 100 square feet area there were seven competitors; £10 was offered for first prizes with others of handsome proportion. Mr. W. Earp, gardener to the Right Hon. Joseph Chamberlain, M.P., Birming-ham, was an easy first with a magnificent group, mainly composed of Japanese varieties, the blooms being quite up to exhibition form. The plants were not too crowded, as is the case in many groups, but they displayed their individuality. A few well grown plants of Cocos Weddelliana were effectively arranged among the Chrysanthemums, thus relieving the surface of bloom. A neat edging of Ferns and Crotons completed an excellent group. Mr. Dyer was second with an admirable arrangement. Mr. P. H. Jones, gardener to F. Jenkins, Esq., Olton, was third with dwarfer plants, beautifully fresh, but they were a trifle grounded. trifle crowded. In a smaller group of Chrysanthemums, Ferns, and foliage plants there were seven competitors. Mr. J. Maldrum won premier honours rather easily with plants carrying grand flowers, well grown Cocos Weddelliana, with highly coloured Croton, Eulalias, and Ferns, all lightly arranged. Mr. W. Clements, gardener to Mrs. Horton, Moseley, was second; and Mr. S. Gibbs, gardener to J. B. Marley, Esq., Harborne, third, both showing well.

Cut blooms were staged in sufficient numbers to make a show in

themselves. Prizes of £10, £7 10s., £5, £2 10s., £1 10s., and £1 were

offered for twenty-four incurved blooms, distinct, which produced twelve Mr. Nevc, gardener to C. Van Raalte, Esq., Aldenham Abbey, Redleet, Herts, just managed to secure leading honours by the superior quality of his blooms, which were rather undersized but beautifully fresh and well finished. The varieties were—Back row: Golden Empress, Empress of India, Mons. R. Bahuant, Lord Alcester, Alfred Salter, Emily Dale, Robert Cannell, and Queen of England. Middle row: Madame Darrier, Camille Flammarion, Princess of Wales, Lord Wolseley, Jeanne d'Arc, Prince Alfred, Miss M. A. Haggas, and Violet Tomlin. Front row: Princess Beatrice, Mrs. Coleman, Hero of Stoke Newington, Princess Teck, Lady Dorothy, White Venus, Madame F. Mistral, and Golden Eagle. Mr. A. Haggart, gardener to Mr. J. J. Foster, Ludlow, was second. His blooms were heavier, but lacked the finish and quality of the first prize stand. Messrs. Ray & Co., Teynham, was third; Mr. C. Smith, gardener to W. Showell, Esq., Bellbroughton, fourth. superior quality of his blooms, which were rather undersized but

For eighteen incurved, distinct, five competed, Mr. C. Smith winning with medium-sized neat blooms. Mr. C. Crookes, gardener to Lady Hindlip, Droitwich, was second, and Mr. Haggart third. Mr. Crookes won with twelve incurved, distinct; Mr. Haggart second, and Mr. S. Bremmell, gardener to H. H. F. Hayhurst, Wellington, third, ten

competing.

Japanese blooms made a magnificent display, no less than twenty competing in the class for twenty-four, distinct, similar prizes being offered as for incurved. Mr. R. Parker, gardener to J. Corbett, Esq., offered as for incurved. Mr. R. Parker, gardener to J. Corbett, Esq., Impney Hall, Droitwich, succeeded in winning the coveted award with a stand of heavy biooms, well displayed. The varieties were—Back row: Etoile de Lyon (grand), Van den Heede, Florence Davis, Mrs. C. H. Payne, Colonel W. B. Smith (fine), Madame Octavie Mirbeau (charming), Boule d'Or, and Viviand Morel. Middle row: W. H. Lincoln, E. Molyneux, Lady Lawrence, G. C. Schwabe (good), Mdlle. Thérèse Rey, W. Seward, and Sunflower. Front row: Madame Isaac, President Borel, Le Verseau, C. Blick, G. Herrin, M. E. A. Carrère, and Mrs. F. Jameson. Mr. Haggart was a good second; Mr. W. Earp third: and Mr. Neve fourth. third; and Mr. Neve fourth.

Mr. Haggart won premier position in the class for eighteen, distinct, with grand blooms. Mr. C. Smith was second, and Mr. R. Parker a very close third. The competition in the class for twelve Japanese, distinct, was keen, but Mr. J. Austin, gardener to the Earl of Dudley, Witley Court, was ahead with grand blooms. Mr. Haggart was second, and Mr. Bremmell third. Mr. Hewitt, Solihull, staged the best Anemones, a fairly good stand. Mr. J. Justice, gardener to Sir G. Temple, Bart., Kempsey, was second. Miscellaneous plants were largely contributed, though space forbids full details being given.

Birmingham has always been notable for its Primulas. For twelve singles, Mr. F. Denning, Hall Green, vas no exception. Moseley, won with fine plants; Messrs, Thomson, Spark Hill Nurseries, second; and Messrs. Popc & Sons third. For six doubles Mr. Denning Six Fern-leaved, Messrs. Pope again won, Messrs. Thomson following. first, Messrs. Thomson second. In the classes set apart for gentlemen's gardeners only, Mr. P. H. Jones, gardener to F. Jenkins, Esq., Olton, won first honour for twelve, and also for six with magnificent examples, also securing the silver medal for excellence of culture. Mr. Coldecott, gardener to W. Matthews, Esq., Edgbaston, was second in the former class. Cyclamens were grandly shown by Mr. Earp in the classes for both twelve and six plants. Bouquets were a feature of the Show, Messrs. Perkins winning with a magnificent arrangement, mainly of Orchids, in

Fruit can only briefly be noticed. Mr. Goodacre won the premier award for six bunches of Grapes with grand examples of Gros Colman, Muscat of Alexandria, Alicante, White Tokay, and Gros Maroc. Mr. Bannerman, gardener to Lord Bagot, Rugeley, second. Mr. J. Bates, gardener to T. T. Harris, Esq., Stone, won for three bunches black Grapes with Fros Colman, among nine good exhibits; and also for one bunch black. For two bunches any white variety, Muscats excluded, Mr. J. Waldron won with White Nice. For three bunches of Muscats, Mr. W. Earp A magnificent collection of eight dishes of Pears won for Mr. Austin the first prize. They were grand fruits of Béurre Diel, Marie Louise, Durondeau, Bergamot Esperen, Josephine Gregoire, Glou Morçeau, Easter Beurré, and Beurré Rance. Mr. Austin also won first honours for one Pine, staging a good example of Smooth Cayenne.

RUGBY .-- NOVEMBER 15TH AND 16TH.

THE seventh annual Show of the Rugby Chrysanthemum Society was held in the Town Hall on the above dates. The arrangements, under the superintendance of the able Secretary, Mr. W. Bryant, were excellent in every way. There was a considerable increase in the number of entries this year, the total being 300, against 217 of the previous show.

The leading class was for thirty-six blooms, eighteen incurved and eighteen Japanesc, distinct, the first prize being £5 and a special prize value £1 Is., together with a certificate of the N.C.S. Mr. W. Pearce, gardener to S. Loder, Esq., Floorc House, Weedon, secured the premier position, having a grand stand of blooms, the Japanese being especially good in form and colour. The following were the varieties most worthy of recognition. Beauty of Castle Hill, Puritan, Bouquet des Dames, Edwin Molyneux, Mdlle. Marie Hoste, Louis Boehmer, J. Stanborough Dibben, Mrs. Falconer Jameson, W. H. Lincoln, Viviand Morel, Florence Davis, Comte de Germiny, Stanstead White, Mrs. E. W. Clarke, Avalanche, Etoile de Lyon, Boule d'Or, Mrs. E. W. Wheeler, Golden Empress of India, Robert Cannell, John Lambert, Refulgens, Alfred Lyne, Mrs. N. Davis, Lord Alcester, Jardin des Plantes, Lady Dorothy,

second.

Queen of England, Prince Alfred, and Lord Eversley. Mr. W. Tustin, gardener to Arthur James. Esq., Coton House, Rugby, was a good second, his best blooms being Miss M. A. Haggas, Empress of India, Lord Alcester, Ralph Brocklebank, and Condor. Mr. Harman, gardener to the Right Hon. Earl of Denbigh, was a creditable third with a stand of neat blooms. For the premier incurved bloom in the Show, Mr. Tustin was to the front, having a splendid example of Miss M. A. Haggas, and with a grand flower of Viviand Morel, Mr. Pearce secured the award for the premier Japanese.

In the class for twenty-four blooms (Japanese), Mr. Pearce was again first, his best varieties in this class being Viviand Morel, Mrs. C. W. Wheeler, Madame Clemence Audiguier, Thunberg, Mrs. E. W. Clark, Stanstead White, Florence Davis, Miss Lilian Bird, Mdlle, Marie Hoste, Mr. A. H. Neve. As in the previous class Mr. Tustin was a good second, the third prize going to Mr. Harman. For twenty-four incurved Mr. Harman succeeded in securing first honours with medium-sized but well-finished blooms. For twelve blooms, incurved, the first and second prizes fell to Mr. Pearce and Mr. Tustin in the order named, the third being awarded to Mr. Dunkley, gardener to S. Symington, Esq., J.P. Brooklands House, Market Harborough. For twelve Japanese Mr. Tustin was first, the second prize in this class going to Mr. F. J. Blake, gardener to G. Singer, Esq., Counden Court, Coventry. Mr. Tustin was again first for six incurved and six Japanese, distinct. Mr. J. Blakeway, gardener to P. A. Muntz, Esq., M.P., Dunsmore, Rugby, was a close second; and Mr. J. Newman, gardener to Mrs. Morgan, Moulsworth, Bilton Road, Rugby, third. For twelve blooms, incurved, Mr. Tustin was again to the front, Mr. J. Blakeway and Mr. J. Newman following in the order named. For twelve Japanese Mr. Blakeway was an easy first, Mr. Tustin second, and Mr. J. Newman third.

For a group of Chrysanthemums arranged in a space equal to 60 square feet, the number of varieties, quality of blooms, and general effect to be the leading feature, Mr. J. Blakeway was an easy first. Mr. A. J. Kilbourne, gardener to Miss Bridgman Simpson, Bilton Hall, Rugby, was second. For a special group, arranged in a space equal to 40 square feet, the leading honour went to Mr. J. Frost, James Street, Rugby; Mr. J. W. Morris, gardener to A. E. Donkin, Esq, Rugby, being placed second. Mr. J. Newman gained the first prize in the class for four trained specimen Chrysanthemums, Mr. J. Blakeway being

Fruit was extensively shown, and was of excellent quality. Two magnificent bunches of Muscat of Alexandra Grapes secured for Mr. Harman the premier award, Mr. J. Blakeway being second with some well finished bunches of Black Alicante. Apples were remarkable for their size and colour, Pears being also of an excellent quality. Amongst the chief prize winners may be mentioned Messrs. Pearce, Blakeway, Morris, and Newman. The display of vegetables exhibited this year totally eclipsed that of any previous occasion, but space precludes entering their good qualities here.

SOUTH SHIELDS .-- NOVEMBER 15TH AND 16TH.

"A SPLENDID Show" was the verdict pronounced by everyone who saw the South Shields and Northern Counties' Exhibition held in the Royal Assembly Hall of that town. The competition in nearly all the fifty-two classes was keen, and while the productions in the Chrysanthemum classes were of the very highest merit, the produce in both the Grape and vegetable classes were very superior.

For twenty-four Japanese, not less than twelve varieties, Mr. P. Blair, Trentham Gardens, Stoke-on-Trent, gained first honours with Puritan, Beauty of Castlewood, Viviand Morel, R. C. Kingston, M. Rivon, Sunflower, Etoile de Lyon, Beauty of Castlewood, Chas. Blick (very good), W. Shrimpton, Mrs. A. H. Neve, Viviand Morel, G. C. Schwabe, J. S. Dibben, Vice-President Audiguier, C. Blick, Mrs. E. W. Clark, Dorothea Shea, G. Atkinson, Etoile de Lyon, Puritan, Excelsior, Vice-President Audiguier, and John Dyer. Mr. Thos. Wheeler, gardener to C. Mitchell, Esq., Jesmond Towers, Newcastle, was second with fresh and massive blooms. Mr. James Coultas, gardener to Alderman Harding, J.P., Darlington, was placed third, and Mr. G. E. Smith, Floral Cottage, Paull, near Hull, fourth. Eight collections were staged.

In a corresponding class for twenty-four incurved, Mr. Blair was again to the front with a good collection, consisting of Lord Alcester, Violet Tomlin, Queen of England, Empress of India, Novelty, Lord Wolseley, Alfred Salter, Princess of Wales, Mrs. Heale, John Salter, John Doughty, Alfred Lyne, Baron Hirsch, Golden Empress, Prince of Wales, Camille Flammarion, Alfred Salter, Empress of India, John Lambert, and Madame Darrier. Mr. James Coultas was placed second, staging large but somewhat flat blooms, Queen of England, Jeanne d'Arc, and Nil Desperandum being his best flowers. Mr. Smith gained the third place, and Mr. G. W. Pinkney the fourth.

For eighteen Japanese, twelve varieties, there were seven competitors, first honours being secured by Mr. George Craig, gardener to Mrs. Barclay, Richmond. Mr. Wheeler was close second, and Mr. George Smith a good third. There were the same number of exhibits in the corresponding class for eighteen incurved, and Mr. Blair was well to the front, Messrs. Smith & Pinkney sharing the other prizes in the order of their names. There were nine collections of twelve Japanese, distinct, the best coming from Mr. Wheeler, Mr. Blair, and Mr. Craig, being placed second and third respectively. Mr. J. Corbett, gardener to the Marquis of Normanby, Mulgrave Castle, Whitby, was awarded the first position for twelve incurved distinct, while Mr. Coultas and Mr. Richardson shared the other awards as here given. Anemones were represented by six collections, the best coming from Mr. Wheeler,

Messrs. Smith & Blair being second and third respectively; reflexed and Pompons were also well represented, and shown in high order of cultivation. Hand bouquets, bridal bouquets, epergnes, lady's sprays and buttonholes were staged in profusion, and added immensely to the attractions of the Exhibition.

Groups of Chrysanthemums and other flowering and foliage plants were pleasingly arranged, and the class found nine competitors, Mr. J. Wood, Riverside Gardens, Morpeth, was a good first; Mr. H. Brown, gardener to Alderman Redhead, second; Mr. Richardson, third, and Mr. G. Burton, fourth. Table plants and Primulas are seldom seen better exhibited and in greater numbers than was staged here. Mr. Alex. Purvis was a strong exhibitor in the local plant class, and gained several prizes, while Mr. W. Partridge figured prominently in the local cut bloom classes.

Mr. Bernard Cowan and others laboured hard to further the interest of the Society's work, and their efforts were well rewarded by the excellence of the display and the large company of visitors who patronised the exhibition.

BRISTOL,-NOVEMBER 15TH AND 16TH.

A GRAND display of all kinds of flowers in season as well as Chrysanthemums generally was made at Bristol on this occasion. A delay occurred in getting the prize cards in position, and if prizewinners names are omitted in this report it is owing to these not being forthcoming in time to be taken down.

With six specimen plants of incurved varieties Mr. Ayres, gardener to Mr. Gibson, was well first. Mr. J. West, Clifton, was a good second, and Mr. G. Sutton, gardener to Mr. Todd, third. The first prize for six reflexed varieties also went to Mr. J. Ayres, Mr. H. Spry, gardener to Mr. D. Bain being second, and Mr. M. S. Blacker, gardener to Miss Charlet, third. The best three specimens of Japanese varieties were shown by Mr. J. Ayres, Mr. G. Sutton being second. Mr. J. Southard received a first prize and silver medal for a single specimen of incurved variety, showing a very fine plant of Mr. G. Rundle. The first prize for a Japanese variety went to Mr. J. Ayres. A first prize for a group of Chrysanthemums went to Mr. J. Marshall, who made a very imposing display. In another class for a group consisting of Chrysanthemums and fine foliaged plants Mr. G. Newbury, gardener to Mr. Joshua Saunders, was first. Mr. W. Bannister, gardener to Mr. H. St. Vincent Ames, was second, and Mr. J. Atwell, gardener Mr. D. Brain, third. Groups of miscellaneous plants were also good, and in this instance Mr. G. Newbury was first, and Mr. G. Shelton second. The principal winners in the other plant classes were Messrs. J. Kent, W. Bannister, A. Hancock, G. Shelton, W. Baston, G. Price, E. S. Cole & Son, F. Edwards, W. Marshall, and J. Ayres.

Cut blooms were grand, all the thirteen classes provided for them being well filled. The best twenty-four incurved varieties were shown by Mr. Aplin, gardener to Mr. W. Meath Baker, Gloucester, who had Lord Alcester, Princess of Teck, Mrs. Norman Davis, Richard Parker, Alfred Salter, Empress of India (2), Princess of Walesi(2), John Lambert, Empress Eugénie, Isabella Bett, Miss Haggas, Lady Dorothy, Jeanne d'Arc, Lord Eversley, Mrs. R. King, Lord Wolseley, Hero of Stoke Newington, and Barbara. Messrs. W. and G. Drover, Fareham, were second; and Mr. G. Runnacles third. In the corresponding class for Japanese varieties Messrs. W. and G. Drover were first, having massive well-coloured blooms of G. S. Schwabe, Viviand Morel, Miss A. Hartshorn, Mille. Marie Hoste, Mons. Bernard, Col. W. B. Smith, Sunflower, Mrs. E. W. Clarke, Mons. Pigny, Sarah Owen, Mrs. C. H. Wheeler, Vice-President Audiguier, William Seward, Gloriosum, Bessie Drover, Charles Davis, Mrs. C. H. Payne, Stanstead White, Florence Davis, W. H. Lincoln, Lilian S. Bird, Etoile de Lyon, Mrs. E. D. Adams, and John Shrimpton.

The best eighteen Japanese varieties were shown by Mr. W. Robinson, gardener to Lord Justice Lopes, Westbury. With twelve Japanese varieties Mr. Robinson was again first, showing fine blooms. The best eighteen incurved varieties were shown by Mr. Bishop, gardener to the Rev. F. C. Drake. The first prize for twelve incurved varieties was well won by Mr. G. Runnacles. For twelve blooms of Anemone-flowered Chrysanthemums, in not less than six varieties, Mr. W. Robinson was a good first. The same exhibitor took the lead with reflexed varieties.

Special prizes were offered for six new Japanese varieties, and once more Mr. Robinson was first, having good blooms of Mrs. C. H. Payne, Mrs. E. D. Adams, J. S. Dibben, Duke of York, Colonel W. B. Smith, and Robert Owen. A prize was also offered for a single bloom of any Japanese variety sent out in 1892 or 1893, and this was well won by Mr. W. Wells, Redhill, who had a perfect bloom of Lord Brooke. Bouquets, vases, and floral decorations generally were as they always are at the Bristol Shows numerous and good, Mr. C. Winstone, Clifton, being among the most successful of the exhibitors.

Fruit was extensively shown, and merits a fuller report than can be given of it. For a collection of six dishes, Mr. Nash, Badminton, was an easy first, Mr. Bannister being second, and Mr. H. Perkins, gardener to Mr. Drucker, third. Mr. Marshall was awarded a first for Black Hamburgh and also for Mrs. Pince's Muscat Grapes. Mr. Nash had a first for grand Gros Colman; while the premier award for Alicante went to Mr. F. Lewis. Very good also were the first prize Muscats, shown by Mr. J. Gibson, Draycot Manor; White Tokay, shown by Mr. E. Silk; and Lady Downe's and Gros Maroc, shown by Mr. Jones, Bath, the first prize being awarded in each instance. Apples and Pears were also remarkably good. Mr. W. Bannister was the winner of first prizes for both collections of the former, and also for six varieties of Pears. Mr. W. Nash gained the first prize for four varieties. Other successful

exhibitors in these and the single dish classes were Messrs. Virgo, E. Hall, Mogford, H. Dunn, W. March, R. Carver, and A. Drucker.

Non-competitive exhibits were fairly numerous and exceptionally good. Mr. J. Crispin, Bristol, had a charming bank of Orchids; Messrs. Cannell & Sons, Swanley, a really beautiful display of new Chrysanthemums and Zonal Pelargoniums with Ferns; while Messrs. Garraway and Co., Durdham Downs Nursery, Clifton, exhibited a grand collection of Apples.

WINCHESTER.—NOVEMBER 15TH AND 16TH.

A COMPACT Exhibition was that held in the Guildhall in this city on the dates named. If the exhibits were not numerous they possessed

quality, which is encouraging to all concerned.

The principal interest was centred in the cut bloom classes. The most important being that for forty-eight half Japanese, and the remainder incurved. The first prize was a silver cup value £15, presented by the ladies of Winchester in addition to a cash prize of £5. Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, secured the premier award with even, neat blooms, tastefully arranged. The varieties were Col. Smith (2), Thomas Hewitt (2), Viviand Morel (2), W. H. Lincoln (2), Waban, Primrose League, Ruth Cleveland, Mr. B. Findiay (2), Lord Brooke, Mdlle. Marie Hoste, Mrs. Nesbit, Stanstead White, Golden Wedding, F. Davis, Paul Marguerite, R. Brocklebank, Miss A. Hartshorn, Vice-President Audiguier, and Le Verseau. Incurved: Lord Alcester (2), Alfred Salter (2), Baron Hirsch, Queen of England (2), J. Doughty, Mons. Bahuant, Miss M. A. Haggas, Prince Alfred, Princess of Wales (2), Empress of India, Lord Wolseley, Mrs. Heales, Pr lude, Mrs. Coleman, Hero of Stoke Newington, Golden Empress (2), Lady Dorothy, and Violet Tomlin. Mr. H. W. Brown, gardener to A. B. Welch Thornton. Esq., Beaurepaire Park, Basingstoke, was a close second. Mr. Agate, Havant, was a good third.

Mr. G. Trinder, gardener to Sir H. Mildmay, Dogmersfield Park, Winchfield, won for twenty-four Japanese with a good stand of blooms. Messrs. Brown & Agate followed in the order named. Mr. J. Hughes, gardener to W. Baring, Esq., Norman Court, Salisbury, won for twelve incurved; Mr. Neville, second; Mr. Brown, third. Mr. Hughes also won for twelve Japanese. For six blooms incurved, any one variety of the "Queen" family, Mr. Agate secured leading position with Lord Alcester in good form. For six blooms incurved, any variety excluding the "Queen" family Mr. Neville won with Princess of Wales. Mr. Brown with Mdlle. Marie Hoste won for six any white Japanese, Mr. Hughes second with Florence Davis. Mr. F. Smith, gardener to Lady E. Woodhouse, Mayfield, Winchester, won for six, any one coloured variety with Viviand Morel. For twelve Japanese, not less than eight varieties, Mr. G. Street, gardener to Dr. Fearon, The College, Winchester, was

easily first.

Chrysanthemums in pots made a good display. For eight trained specimens, Mr. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, won easily. Mr. E. Astridge was second. Mr. Carr had the best specimen in both the incurved and Japanese sections. In the latter he showed Madame B. Rendatler, having fully 300 expanded blooms. For the best group of Chrysanthemums, Mr. F. Broomer, Tower Street Nursery, Winchester, was ahead of Mr. G. Street for the premier position with dwarf plants, lightly arranged. A class was provided for plants in pots not larger than 9 inches, suitable for conservatory decoration, which produced good results. Mr. G. Adams, gardener to Col. F. A. Dickens, Blackbridge, Winchester, was first. Mr. Carr had the best group of miscellaneous plants arranged for effecta charming arrangement. Mr. T. Munt, gardener to Mrs. C. Warner, Northlands, Winchester, second. The Misses Flight, Webb, and Golding were the principal exhibitors in the classes for the best arranged stand of Chrysanthemums, and also that arranged with hardy shrubs, Ferns, and Grasses.

Fruit was well shown. Mr. E. Hillier, nurseryman, Winchester, had a group of miscellaneous plants, "not for competition." Mr. Molyneux, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, staged some splendid cut blooms, representing the incurved, Japanese, and single-flowered sections, and also two dozen bunches of freely flowered varieties, all of which tended to improve the Exhibition.

PARKSTONE.—November 15th and 16th.

THE newly formed Parkstone Chrysanthemum and Horticultural Society held its first Exhibition of plants, cut blooms, fruits, and vegetables in St. Peter's School Rooms, on the above dates, proved a success.

Groups of Chrysanthemums made a very good show, the plants being well grown, the flowers large and fresh, and the colours judiciously intermixed. Those arranged by Mr. W. Weeks, gardener to E. N. Blanchard, Esq., and Mr. T. Gould, gardener to Mrs. Dawson Damar, were decidedly the best. Good groups were arranged in the local classes by Messrs. J. Jackson and Bodger, both of Parkstone.

Mr. W. Taylor, gardener to Mrs. Elphinstone, Christchurch (the winner of the ten-guinea cup at Bournemouth last year), had the best stand of twelve Japanese, including excellent blooms of Viviand Morel, Mrs. Wheeler, and Florence Davis; Mr. G. Shave, gardener to W. W. Moore, Esq., Bournemouth, had the second best stand, and Mr. T. Gould the third best. In the corresponding class for incurved, Mr. Taylor was to the front again, Mr. Gould being second, both showing good all round blooms. Mr. G. Shave had the best stand of Ancmonce, also of reflexed; Mr. Bason, gardener to Mrs. D. M. Fox, being second in both classes.

Vegetables were shown in excellent condition. Mr. Taylor had the best collection of eight kinds. Mr. T. Gould was a creditable second.

Mr. Taylor was also first in the open class for two bunches of Grapes. In the local class, Mr. Gould, and Mr. House, gardener to J. Jackson, Esq., were respectively first and second for a like number of bunches, showing Lady Downe's. Mr. Hillier, gardener to Mr. Kilner, showed the best two dishes of dessert Apples, and was also first for cuinary Apples, and for Pears.

Mr. T. K. Ingram contributed a fine bank of grandly flowered Chrysanthemums, which, being effectively arranged commanded a good deal of attention, as also did an arrangement of choice cut flowers.

HEREFORD.—November 15th, 16th, and 17th.

THE Exhibition was held in the spacious Shire Hall, which was filled to overflowing, passages and corridors having to be utilised to stage the exhibits as the large halls would not contain them. The fruit was well worthy of the county, being large, splendidly coloured, and in great quantities. The improvement in the farmers' and cottagers' exhibits

prove the increased interest they now take in fruit culture.

Groups of Chrysanthemums were more numerous than last year, and of much better quality. Withs' Plant Food Co., Hereford, won the cup with well-grown plants and large blooms, edged with small Palms, Ferns, and Roman Hyacin'hs. Sir J. Pulley came second with a fine group, but lost the first position through a fault in arrangement. For twelve and for six plants C. Loder Gilbert, Esq, took chief honours in each case for plants profusely bloomed. For thirty-six cut blooms, eighteen incurved and eighteen Japanese, R. W. D. Harby, Esq., was first with massive blooms, Sir J. Pulley second with much smaller flowers. Mr. Harby was the most successful for twelve Japanese and for twelve incurved. In the classes open to Herefordshire only Withs' Plant Food Co. was first for thirty-six cut blooms, C. Lee Campbell, Esq., second, and J. Parkin, Esq., M.P., third, all staging good blooms. In the smaller classes Messrs. Greathead, Whitfield, and Sir J. Pulley took leading honours.

For 100 dishes of Apples, Messrs. Geo. Bunyard & Co., Maidstone, were first with a magnificent collection, the fruit fresh, large, and highly coloured. Mr. J. Watkins came second with fruit little if at all inferior to Messrs. Bunyard's, and the English Fruit and Rose Company, Hereford, third with clean fruit of good size. For twenty-four dishes of Pears, Mr. J. Watkins was an easy first with fruit of immense size and fine colour. This exhibitor was awarded first honours for the finest dish of Apples (Peasgood's Nonesuch), and the best dish of Pears (Glou Morçeau) in the Show out of the above collections; J. Rankin, Esq., M.P., took second position in the above Pear class. With thirty dishes of Apples C. Lee Campbell, Esq., Glewston Court, Ross, was first with a collection remarkable for size and colour, Mr. Evans, Moreton Court, Hereford, came second, and Lady Emily Foley, Stoke Edith Park, Hereford, third; the points in this class were very close. In the single dish classes, the English Fruit and Rose Company, Rev. Sir G. H. Cornewall, Rev. G. H. Davenport, Geo. Pewtress, Esq., Mrs. Evans, H. Hamer, Esq., C. Lee Campbell, Esq., and Rev. W. H. Lambert were the most successful competitors.

Amongst amateur growers W. E. King-King, Esq., was first with twenty-four dishes of Apples, Sir J. Pulley second. For twelve dishes of Apples, Mrs. Watkins, Wilcroft, secured first honours, and Mrs. Woodhouse, Burghhill Court, second. With nine dishes of dessert Apples, distinct, Mr. W. J. Grant, Bassaleg, Newport, Monmouthshire, was a very good first. The same exhibitor was also first for one dish of dessert Apples, and for six dishes of dessert Pears, all very finc.

For six dishes of dessert fruits, C. Lee Campbell, Esq., took leading honours with beautifully finished Muscat of Alexandria and Alicante Grapes, fine Blenheim Orange Apples, Beurié Diel Pears, Imperial Green Melon, and fine Medlars. Sir J. Pulley, was a good second, and J. Rankin, Esq., M.P., third; the same exhibitor taking most of the Grape prizes. Mrs. Evans and Sir J. Pulley took the Tomato prizes in the order named. For a collection of hardy fruits and nuts, Mr. J. Watkins was first with a highly interesting exhibit.

Special prizes were given for collections of Apples and Pears by Mr. J. Watkins and the English Fruit and Rose Co., which were won by Mr. W. J. Grant, Mrs. Evans, and Sir J. Pulley. It would occupy too much space to name the exhibitors in all the classes, but in every case the fruit was highly creditable, and proved conclusively what Herefordshire can do as a fruit-growing county. The Society are also extremely fortunate in having an excellent Secretary—viz., Mr. John Ough, who has worked hard to make the Show a success.

On the closing day of the Show a fruit conference was held in the Shire Hall, which was filled with a highly interested audience, and much information circulated on fruit culture. Papers were read on "Fruit Growing as a Commercial Industry," by Mr. J. Cranston. "The Gathering, Storing, and Marketing of Apples and Pears," by Mr. J. Watkins; and the "Cultivation of Grapes and Tomatoes," by Mr. S. T. Wright.

YORK.—NOVEMBER 15TH, 16TH, AND 17TH.

THE fourteenth annual Chrysanthemum Show, under the auspices of the Ancient Society of York Florists, was held in the Fine Art Exhibition buildings of the city. The number of entries showed a slight falling off from those of last year, more especially in the section devoted to cut blooms, but the customary high quality was ably maintained. Groups were a great feature, the whole of the floor of the central hall being reserved for their accommodation. Taken as a whole they were excellent, admirable taste having been displayed in the

arrangements. The Japanese blooms were very fine, and the incurved were of exceptional excellence. Bouquets of Chrysanthemums and baskets of the same flowers were largely staged. Superior taste was displayed in the arranging of the flowers, and the effect produced was consequently striking and highly beautiful. The management of the Show in the energetic hands of Mr. J. Lazenby, the Secretary, and the Committee were excellently carried out, and high praise must be accorded these gentlemen for their efforts. We append a list of the prizewinners in the principal classes, space not allowing us to give details of all.

In the class for a group of Chrysanthemums interspersed with foliage plants, Mr. G. Slater, gardener to Mr. Alderman Close, The Hollies, was first. The arrangement was excellent, Palms, Asparagus, and other plants having been utilised to much advantage. In addition to the first prize a handsome silver cup was given in this class. Mr. McIntosh, gardener to J. T. Kingstone, Esq., Clifton, York, was a close second with a highly creditable exhibit; Mr. J. R. Dawe, gardener to Dr. Bedford Pierce, The Retreat, York, being third; and Mr. Smallwood, gardener to H. Leetham, Esq., Burnholme, York, fourth. An extra prize was descreedly accorded to Mr. J. Sinclair, Blake Street, York. In the class for a group of Chrysanthemums, arranged for effect in a space not exceeding 80 square feet, Mr. E. Everard, gardener to Mrs. Gutch, Holgate Lodge, York, was first with an admirable exhibit. plants were carrying good flowers and stout healthy foliage. Mr. J. Hunt, gardener to J. Sinclair, Esq., York, was accorded the second position; Mr. S. Hardcastle, Huxley Road, York, being third; and Mr. J. Vear, gardener to Miss Steward, Bishopthorpe, York, fourth. Mr. R. Hudson, Acomb, York, was a splendid first for a group of Chrysanthemums, the class being open to amateurs within a five-mile radius of York. The plants were excellent examples of cultural skill, The second prize went to Mr. George Hudson, Lowther Street, York; the third to Mr. J. Pillmoor, 4, George Terrace, York; and the fourth to Mr. J. Emms. For four incurved plants, distinct, Mr. W. Dickenson, Gale Lane, Acomb, York, was awarded the premicr position and a silver medal, with handsome specimens of Mr. Bunn, Lord Wolseley, Mrs. G. Rundle, and Robt. Cannell. Mr. Everard took the second position, and the third to Mr. W. Dodd, gardener to the Hon. Claud Lambton, Grove Lodge, York.

For one incurved, distinct, Mr. Everard was first with Mrs. Dixon, Mr. Dickenson second with Mrs. G. Rundle, and Mr. Slater third with the same variety. Mr. Everard was a good first for four Japanese specimens, distinct, staging Mrs. Gutch, Val d'Andorre, Madame de Sevin, and Mdlle. Lacroix in fine form, Messrs. Vear and Slater being second and third in the order named. The first prize for a single specimen Japanese went to Mr. Everard for a grand example of Madame de Sevin, the second to Mr. Dickenson for Sarah Owen, and the third to Mr. Vear for Val d'Andorre. Mr. Vear was first in the class for four reflexed specimens, showing Golden, White, and Pink Christine, and Cullingfordi, all splendidly flowered. Mr. Everard was first for one reflexed with a grand plant of Golden Christine, Mr. Vear second with the same variety, and Mr. Dobbs third with Chevalier Domage. Mr. T. Smith, Norwood Nursery, Beverley, was first for four specimen Pompons, showing superb plants of White Cedo Nulli, Salamon, Golden Mdlle. Marthe, and Sœur Mélanie. The second and third prizes went to Messrs. Vear and Dawe respectively. Mr. Smith was again first for a single specimen Pompon with a superb example of White Cedo Nulli; Mr. Dickenson being second with Mdlle. Marthe, and Mr. Vear third with Mr. Astie. For a single specimen Anemone flowered plant Mr. Dickenson was first with Sœur Dorothé Souille, Mr. Everard second with the same kind, and Mr. Vear third with Margaret de St. Vallangossie. In the class for six Chrysanthemums, any varieties in 7-inch pots suitable for decorative purposes, Mr. Smith was a good first with Golden and White Cedo Nulli, Sœur Dorothé Souille, Salamon, Black Douglas, and Sœur Mélanie; Mr. Everard second with a charming exhibit.

The principal class in the cut bloom section was for thirty-six blooms, half to be Japanese, and the remainder incurved, not less than twelve distinct varieties of each to be staged. The premier prize went to Mr. Ritchings, gardener to Dr. Frankland, Red Hill, who staged superb examples, more especially amongst the incurved. The stand was composed -back row: Edwin Molyneux, Etoile de Lyon, Florence Davis, President Borel. W. H. Lincoln, Edwin Molyneux. Middle row: Viviand Morel, Robert Owen, Chas. Shrimpton, Princess Victoria, Mrs. Falconer Jameson, Viviand Morel. Front row: Robert Owen, Mons. Bernard. Lord Brooke, Etoile de Lyon, Mrs. Nevill, and Mrs. E. W. Clarke, Incurved—back row: Golden Empress, Empress of India, Lord Alcester Mrs. Robinson King, Empress of India, Golden Empress. Middle row: Jeanne d'Arc, Violet Tomlin, Queen of England, Lord Alcester, Queen of England, and Mrs. Robinson King. Front row: Miss M. A. Haggas, Princess of Wales, Madame Darrier, Princess Teck, Mrs. S. Coleman, and Jeanne d'Arc. The second prize went to Mr. G. Haigh, gardener to W. H. Tate, Esq., Woolton, Liverpool, whose exhibit was particularly strong in Japanese, the best of which were Mrs. C. Harman Payne, Chas. Davis. W. H. Lincoln, and Mrs. Falconer Jameson. The incurved were generally somewhat weak, Mons. R. Bahuant, Jeanne d'Arc, and Lord Wolseley being amongst the best. Mr. Folkard, gardener to Sir J. R. Walker, Bart., Sand Hutton, York, was a fair third. There were four competitors in this class, and the competition was remarkably keen. For twenty-four blooms, half incurved and half Japs, in distinct varieties, Mr. G. Anderson, gardener to A. Milnthorpe, Esq., Tower Hill, Cottall, was a good first, staging Japs—back row: Stanstead White, Etoile de Lyon, Puritan, and Boule d'Or. Middle row: Sarah Owen,

W. W. Coles, Belle Paule, Mdlle. Lacroix. Front row: Gloire du Rocher, Mont Blanc, Val d'Andorre, Sunflower. Incurved—back row: Violet Tomin, Mrs. Heale, Lord Wolseley, Empress of India. Middle row: Jeanne d'Arc, Baron Beust, White Beverley, Mr. Bunn. Front row: Mr. Brunlees, Princess of Wales, Cherub, and Princess Beatrice. Mr. Folkard was a good second, his Japanese especially being refined blooms. The third prize went to Messrs, G. Longster & Son, Malton, and the fourth to Messrs, J. Horsley & Sons, Malton. Mr. Folkard was first for twelve incurved, distinct, staging—back row: Jeanne d'Arc, Princess of Wales, Mons. R. Bahuant, Golden Empress. Middle row: Robert Cannell, Lord Alcester, Queen of England, Mrs. W. Shipman. Front row: Miss M. A. Haggas, Violet Tomlin, Cherub, and Mrs. S. Coleman, Messrs. Longster and Son being second.

Mr. J. Haigh was first for twelve Japanese, distinct, with handsome blooms of—back row: Chas. Davis, W. H. Lincoln, G. C. Schwabe, Mrs. C. Harman Payne. Middle row: Boule d'Or, Florence Davis, Etoile de Lyon, Mons. A. E. Carrière. Front row: Edwin Molyneux, Lord Brooke, Puritan, and Gloire du Rocher. Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Hall, Helmsley, was second with a highly creditable exhibit; Mr. D. Dickenson, gardener to W. B. Richardson, Esq., Elm Bank, Hull, being third. For six Japanese, one variety, Mr. Anderson was first with Boule d'Or; Messrs. J. Horsley and Son second with Viviand Morel; and Mr. D. Williams third with W. H. Lincoln. Mr. Ketchell, gardener to C. H. Simpson, Esq., Moortop House, Ackworth, was first for twelve Anemone-flowered, in not less than six varieties, with Delaware, Nelson, Sabine, Mrs. J. Benedict, Jeanne Marty, Mrs. R. Owen, and Gladys Spaulding. Mr. Dickenson was second; and Mr. Keightley, gardener to G. Whitehead, Esq., Deighton Grove, York, third. For six reflexed blooms, distinct, Mr. J. Haigh was a grand first with Golden and White Christines, Dr. Sharp, King of Crimsons, Fred Hart, and Chevalier Domage. Messrs. Dickenson and Ketchell were second and third in the order of their names. Mr. Lunt, gardener to H. Stourton, Esq., Holme Hall, York, was accorded the premier position for six distinct singles, Mr. Ketchell being second, and Mr. S. Hardcastle third. In the class for eighteen blooms, distinct, with the first prize of which went the "citizens' challenge prize, to be competed for by growers residing within a five mile radius of York, Mr. Dickenson was first with Viviand Morel, Mdlle. Marie Hoste, Sunflower, Stanstead White, Puritan, W. H. Lincoln, Florence Davis, Gloire du Rocher, Mrs. Falconer Jameson, Avalanche, Edwin Molyneux, and Gloriosum Japs; Emily Dale, John Lambert, Golden Empress, Violet Tomlin, John Salter, and Jeanne d'Arc incurved. The second, third, and fourth prizes went to Messrs.

Miscellaneous exhibits included magnificent vegetables and fruit grown in the neighbourhood of York; a collection of Apples from Messrs. Backhouse & Sons, nurserymen, also a number of grand Conifers and Evergreens from the same firm; and Potatoes, Artichokes, Onions, and Beet in excellent condition from Messrs. Kent & Brydon, seedsmen,

Darlington.

CHUDLEIGH .- NOVEMBER 16TH.

THE fourth annual Show was quite the best of the series, and rivalled that of Exeter in point of merit. The competition was not

extensive, but the exhibits were good in quality.

The principal class for thirty-six cut blooms, distinct, half incurved and the remainder Japanese, for which a silver cup was offered by Lady Clifford, Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Teignmouth, was an easy first with well developed blooms in both sections. Mr. Stiles, gardener to Miss Fripp, Teignmouth, second, and Mr. Veale, gardener to the Rev. A. H. Simms, The Rectory, Newton Abbot, third.

Mr. Stiles won the premier award for twelve Japanese, followed by Messrs. Foster and Veale. Mr. Foster was first for six Japanese, and also for six of any white variety. Mr. Stiles won in a similar class for six any yellow variety, Messrs. Foster and Veale following. Mr. Foster won for twelve incurved, Messrs. Stiles and Veale following in the order here given. The same order was maintained in the class for six incurved. Mr. Veale gained the premier award for six Anemone blooms with a creditable stand. Mr. J. Clack secured the principal prizes in the amaturs section with creditable exhibits.

Table decorations and sprays were a feature of the Show. In the former Miss Somerville was the most successful; Mrs. W. J. Colwill, Newton Abbot, easily outdistanced the other competitors.

Groups of Chrysanthemums as well as miscellaneous plants arranged for effect made a commendable display. Mr. E. Daw was the most successful in the former, while Mr. A. Abraham, gardener to the President, the Right Hon. Lord Clifford, Ugbrook Park, Chudleigh, was an easy winner in the latter class. The last named staged by far the

best vegetables in the various classes set apart for them.

MELTON MOWBRAY.—NOVEMBER 16TH AND 18TH.

THE first Exhibition of the Melton Mowbray Chrysanthemum Society was held on the above dates, and the Committee are to be congratulated on the success of their initiating efforts. The room in which the Show took place had a very bright and charming appearance. Two long tables were in the centre, containing the cut blooms, and at the sides were nine competitive and several non-competitive groups. Mr. Whait, gardener to W. Chaplin, Esq., was first with an excellently arranged group containing many good flowers, and was well finished with small Palms, Crotons, and Ferns. Mr. Bolton, gardener to W. Billson, Esq., was second, and Mr. Russell, gardener to Capt. Williams, third.

In the open class for twenty-four blooms, twelve Japanese and twelve incurved, Mr. J. Underwood, gardener to R. Walker, Esq., Enderhy Hall, was first with good hlooms of Viviand Morel, Condor, Mrs. Falconer Jameson, Mdlle. M. Hoste, Edward Molyneux, Sunflower, Mons. Bernard, Etoile de Lyon, Boule d'Or, Puritan, Col. W. B. Smith, and Florence Davis for the Japanese, and Empress of India, Mrs. Robinson King, Queen, Lord Alcester, Miss M. A. Haggas, Prince Alfred, Prince of Wales, Lord Wolseley, M. Darrier, Jeanne d'Arc, Mrs. Coleman, and Princess of Teck for the incurved. Mr. H. Rogers of Gipsy Lane Nursery, Leicester, was second, and Mr. Smith of Loughboro', third. In this class Mr. H. Dunkley, gardener to S. Syminton, Esq., Market Harboro', showed an excellent twelve incurved blooms—the best in the exhibition—but through the falling off in his Japanese he was not placed amongst the prizewinners. Here is a strong argument in favour of separate classes for incurved and Japanese for small shows. classes were well filled, but many of the exhibits were of a poor nature.

Fruit was good in quality, Grapes being excellent. The non-competitive exhibits were plentiful, and added much to the attractiveness of the Show. Mr. W. K. Woodcock exhibited a magnificent wreath, and was first for a hand bouquet of Chrysanthemums. A special feature was

the specimen plants which were numerous.

LINCOLN.—NOVEMBER 16TH AND 17TH.

THE eleventh annual autumn Exhibition was held in the Drill Hall, and was generally a success. The Shows of this Society have long been noted for the excellence of its groups of miscellaneous plants arranged for effect, this year they were even better than in the past. arrangements under the guidance of Mr. Holmes, the Secretary, were

satisfactory.

The principal class was for a group 12 feet square, composed of Chrysanthemums and other plants arranged for effect, and a grand Mr. C. Foster, display was made in the centre of the building. gardener to R. Dawson, Esq., Lincoln, won the coveted award with a magnificent group charmingly arranged. The base or groundwork of the group was composed of moss, from which rose well developed Crotons, single stems, beautifully coloured, intermixed with other choice plants all elegantly arranged. Mr. A. Wipf, gardener to W. C. Cockburn, Esq., Hartsholme Hall, Lincoln, was a good second, and Mr. W. Herring, The Nurseries, Lincoln, third. In the class for a Chrysanthemum group arranged for effect along with green foliage plants in a semicircle Messrs. Foster and Wipf occupied similar positions as in the former class. Mr. W. Mitchell, gardener to W. J. Warrener, Esq., Swallowbeck, Lincoln, third. The hest specimen Chrysanthemums were those staged by Mr. Wipf in the class for six, being freely flowered and not too formally trained. Mr. G. Temple, Lincoln, was second. These two exhibitors changed places in the class for three standards. Palms, Cycads, Ferns, table plants made a good display. In the three former classes Mr. Wipf was the most successful, Mr. Foster winning in the latter. Orchids were well shown by Messrs. Foster and Wipf.

Cut hlooms were of fairly good quality. In the principal classthat for lorty-eight, half incurved and the remainder Japanese, there were but three entries, Mr. F. Thornton, gardener to C. E. Marfleet, Esq., Lincoln, won the premier position by the superior quality of the incurved blooms, the best being Robt. Cannell, Princess of Wales, Golden Empress, J. Doughty, Lord Wolseley, and Princess Teck. The best of the Japanese were Sunflower, Avalanche, F. Davis, Miss A. Hartshorn, Mrs. C. Wheeler, Mrs. F. Jameson, and Vice-President Audiguier. Mr. Wipf was second, and Mr. J. Burrows, gardener to Sir H. Bennett, Lincoln, third. For twelve incurved, Mr. A. Wilcox, 52, London Road, Spalding, was first; Mr. Wipf second. In the class for six Japanese, six reflexed and six incurved, Messrs. Willcox, Wipf, and Mitchell were placed in the order here named. Mr. Wipf had the best of five stands of twelve reflexed, really good blooms. Mr. G. Burrows second. Messrs. Wipf and Wilcox shared the honours in the class for twelve Japanese, both showing good blooms. Anemone varieties were well represented by Mr. Wipf in the classes for Japanese and the ordinary show type. Mr. Burrows second in each class. Viviand Morel won for Mr. Wipf the premier award in the class for six, any one variety Japanese. Single-flowered varieties were well shown by Mr. J. Bugg, Lincoln. The premier incurved bloom in the Show was Princess of Wales from Mr. Wipf, and the premier Japanese was Viviand Morel from Mr. Thornton.

A room was specially set apart for table decoration to be shown under artificial light, and a very commendable display was made. Miss Ellison, The Manse, Bracebridge, Lincoln, won the first prize for the best laid out table for six persons, Chrysanthemums being the only flowers employed with any kind of foliage. Mr. Colebrook, Grimsby, second; and Mrs. F. E. Cole, Hundleby, Spilsby, third. Messrs. Perkins & Son, Coventry, was an easy first for a table of 12 feet by 3 feet filled with bouquets and wreaths. Mr. J. Illman, florist, Nettleham Road, Lincoln,

was a good second; and Mr. Colebrook, third.

SHEPTON MALLET.—November 16th and 17th.

THE third annual Exhibition of Chrysanthemums, fruit, and flowers was held in the Town Hall on the above dates, and was considered to be an improvement upon previous shows held in this place.

Groups were numerous and, for the most part, arranged with good tastc. Mr. J. Webb, gardener to Miss Davis, Oakhill, Shepton Mallet, was first in the principal class with a fine arrangement, Mr. H. Phillips, gardener to Dr. J. F. Fry, was second, and Mr. Mackenzie, gardener to A. T. Somerville, Esq., Dinder, Shepton Mallet, was a creditable third.

In the open class for three incurved and three Japanese plants, single stems, Mr. J. Webb was first, showing six grand plants nearly 6 feet over, in fine condition, and profusely flowered. Single and double flowered Primulas were well shown by Messrs. J. Allen, E. F. Hall, and J. Webb.

In the class for twenty - four blooms, twelve incurved and twelve Japanese, distinct varieties, four good stands were arranged. Mr. W. R. Williams, gardener to J. F. Hall, Esq., Dinder, Shepton Mallet, was first, Edwin Molyneux, Florence Davis, W. H. Smith, Madame John Laing, Waban, Puritan, Sunflower, Viviand Morel, John Salter, Lord Alcester, Miss M. A. Haggas, Golden Empress, and Queen of England (the best bloom in the Show) being the most prominent. Mr. Webb was a good second, and Mr. J. B. Payne, gardener to the Lord Bishop of Bath and Wells, The Palace, Wells, was a creditable third. Messrs. W. R. Williams and J. Webb had the two best stands of twelve blooms in that order.

Fruit was not shown very plentifully, but what was staged was of good quality. Messrs. Brown & Sons, Frome, secured premier position with very good bunches of Muscat of Alexandria, Mr. Payne being second with Black Alicante in good condition. Mr. Payne was first for hoth dessert and culinary Apples. Mr. J. Webb, obtained first place in a fairly good Pear competition with fine examples of Béurié Diel, Mr. R. Isgar, Wells, taking second place with fruits of Glou Morçeau.

Messrs. Browne & Sons, Priory Nurseries, Wells, contributed seventytwo dishes of Apples, eleven dishes of Pears and Medlars, all in fine

condition.

DUBLIN.-NOVEMBER 16TH AND 16TH.

THE Royal Horticultural Society of Ireland held their winter Exhibition in the spacious hall at Ball's Bridge, Dublin, on the 16th and 17th. Cut blooms were the leading feature, plants, as a rule, were getting a little past their best. Lord Ardilaun's prize for a group of thirty plants staged on a space of 14 feet by 7 feet was taken by Mr. Watt, gardener to Mrs. Pease of Willow Park, who was closely followed by Mr. Stewart with an exceedingly fresh and bright group not quite so large in the blooms; third F. A. Millar, Esq. In the separate classes of six each, incurved, Japanese, reflexed, and Anemone, Mrs. Pease took all before her, and also took first for a single specimen with a grand W. H. Lincoln.

In cut blooms the special class with 10-guinea cup and money added for thirty-six, half Japs, half incurved.—First, J. G. Nutting, Esq.; second, Viscountess Ashbrook; third, Earl of Clancarty. Mr. Nutting's special prize for thirty-six Japs in eighteen varieties brought out a strong competition with thirteen entries. Mrs. Pease again took first; second, Lady Bury; third, Earl of Clancarty. The prize added by Mr. Colchester of Ipswich to the Society's first prize for twenty-four incurved was awarded to J. G. Nutting, Esq.; second, Earl of Clancarty; third, Loyd Vaughan, Esq. For twelve incurved, Mrs. Pease again came to the front. For twenty-four reflexed.—First, R. de la Poer, Esq. For twelve reflexed.—First, J. L. Naper, Esq. While for the stand of twelve Japs, Lord Gough took first honours. In a general survey of cut blooms Colonel Smith, Lord Brooke, W. H. Lincoln, F. Davis, and Viviand Morel were very prominent, the latter perhaps too much so. Everyone grows it, everyone shows it, and, like its huge cousin Etoile de Lyon, it seems overdone.

EDINBURGH.—NOVEMBER 16TH, 17TH, AND 18TH.

A MOST successful Exhibition was held by the Scottish Horticultural Association in the Waverley Market on the above dates. The entries were more numerous than at any previous show, and the exhibits generally were quite as good. Lord Provost Russel opened the show on Propitious weather favoured the efforts of the promoters, the first day.

and the attendance of the public was very large.

There was a desirable improvement noticeable on the pot plants generally, those with which Mr. D. Caronagh, St. Edward's, Murrayfield, secured first prize for eight pots Japanese varieties, and for four pots of the same heing particularly good. With a fine Avalanche in the first named class this exhibitor won the silver medal for the best plant in the Mr. J. Holmes, gardener to Mrs. Hamilton, Ogilvie, Winton Castle, East Lothian, was first for four pots incurved varieties, and there were many other classes for Pompons, as well as specially named varieties. There were three groups of Chrysanthemums arranged for effect on the floor, each group to be not more than 15 feet in diameter. Mr. J. Petrie was first with a collection of plants with large blooms. Mr. D. Jardine, Ravelston, second; and Mr. Holmes third. In a similar class for Chrysanthemums and other plants Mr. Wood, gardener to J. Buchanan, Esq., Oswald House, was first. Among other plants shown were good Zonal Pelargoniums, Roman Hyacinths, Primulas, Ferns, and decorative plants. The cut flower section was well filled, the Japs specially being large, well coloured, and fine.

The chief class was the City of Edinburgh prize, open to all, for forty-eight hlooms Japanese, not less than thirty-six varieties; first, £20 cup; second, £10; third, £5. Mr. James Beisant, Castle Huntly, Longforgan, secured the cup with even blooms, including many of the hest of the newer sorts. The most noteworthy were Viviand Morel, C. S. Sharpe, G. C. Schwabe, Boule d'Or, Mdlle. M. Hoste, R. C. Kingston, W. K. Woodcock, Mrs. C. H. Payne, Colonel Smith, Chas. S. Shrimpton, Geo. Darrell, W. W. Coles, Avalanche, and Mme. Carrière, Mr. J. Machar, Broughty Ferry, second, with very good blooms. Third, Mr. Wm. Rushton, Corstorphine, and fourth, Mr. J. Carruthers, Corstorphine, and fourth, Mr. J. Carruthers, Corstorphine, and Mr. Wm. Rushton, Corstorphine, and fourth, Mr. J. Carruthers, Corstorphine. The next class was open to Scottish gardeners and amateurs only, the prize being the Scottish challenge cup, for thirty-six blooms. not less than twenty-four varieties. Mr. D. Nichol, Rossie, Forgan-

denny, secured this prize with a stand of very fine blooms, the second and third prize stands also being good. Mr. Nichols' stand included very fine blooms of Etoile de Lyon, Mr. E. W. Clark, Viscountess Hambleden, very fine Stanstead White, Viviand Morel, Edwin Molyneux, W. Tricker, W. H. Atkinson, Mons. Bernard, and J. S. Dibben. Mr. J. Kyles, Milburn Tower, Gogar, second, and Mr. W. Rushton third. For twenty-four Japanese, not less than twelve varieties, Mr. W. Rushton was first; second, Mr. J. Pirie, Sunderland Hall, Selkirk; third, Mr. P. Geddes, Knock Castle, Largs. For twelve Japanese, distinct, Mr. D. Alexander, Eaglescairnie, Haddington, was first with a very good dozen; second, Mr. Rushton, and third Mr. Pirie. Several classes were devoted to six blooms of one variety. Among these Avalanche (Mr. Geddes first), Viviand Morel (Mr. Alexander first), Sunflower (Mr. Beisant first), Edwin Molyneux (Mr. Nichol first), and Rouguet des Dames (Mr. Edwin Molyneux (Mr. Nichol first), and Bouquet des Dames (Mr. Rushton first) were extra fine.

The incurved and other section were far below the Japenese in ality. For twenty-four incurved, Mr. J. Clark, Bannerfield, Selkirk, quality. This stand included fine examples of Princess of Wales, Miss Haggas, Violet Tomlin (best bloom in Show). Mr. Clark was first also

for twelve incurved.

In the class open to nurserymen for forty-eight blooms, Mr. H. J. Jones, Lewisham, was easily first, securing also the prize for the best

Japanese. Messrs. R. B. Laird & Sons, Edinburgh, second.

Some good Grapes were shown. In the class for four distinct varieties, Mr. Leslie, Pitfour, Perth, was first, showing good clusters of Alicante, Gros Colman, Lady Downe's, and Muscat of Alexandria. Murray, Park Hall, Polmont, second; and third Mr. Caldwell, Ashley Bank, Langholm. Mr. McNiel, Priorsford, Peebles, had the two best Muscat of Alexandria, Mr. Leslie the best pair of Alicante, while Mr. Murray had the best Lady Downe's and the best Gros Colman. Two collections of fruit in twelve varieties were shown. Mr. McIntyr, The Glen, Peebles, first; and Mr. D. Murray, gardener to Marquis of Ailsa, Culzean, Ayr, second. Apples were a feature of the Show. The never been better coloured, though perhaps larger has been seen. They have competition was keen, with many entries for the prizes. Mr. Wilson Auchencrum, Ayr, was first for six dishes culinary; and Mr. Craw, West Foulden, for sixteen dessert. For eighteen varieties Apples and six varieties Pears, Mr. Campbell, Singleton, Wales, was first with beautifully coloured fruit; and for the same number fruit grown in Scotland Mr. Wilson was first.

Vegetables were particularly fine. Leeks, Cauliflowers, Brussels Sprouts, Celery, and Parsley were extensively shown, and mostly very

fine in quality.

Miscellaneous exhibits included a large number of cut Chrysanthemum blooms from Mr. Jones, Lewisham; Carnations from Mr. Campbell, High Blantyre. A table of plants and fine blooms from Messrs. Methven & Sons, Princes Street. Drawing-room decorations and bouquets from Todd & Co., Maitland Street. Some beautiful examples of artistic floral arrangements from Mr. John Dorner, Princes Street, and plants from Messrs. Laird & Sons, West Coates. To most of these special awards were made.

SHEFFIELD.-NOVEMBER 17TH AND 18TH.

A REALLY good Exhibition was that held in the Corn Exchange on the dates named. Cut blooms created the principal interest, the principal classes being for twenty-four incurved, not less than eighteen varieties, the same conditions governing the class for Japanesc.

Messrs. Drover succeeded in easily winning the premier award in both the above-mentioned classes. The incurved were not large, but were fresh and well finished. The varieties were Empress of India, Golden Empress, Lord Alcester, Emily Dale, Miss Drover, Mrs. R. King, Lord Wolseley, Alfred Salter, Mrs. Norman Davis, J. Doughty, Mrs. W. Shipman, Miss M. A. Haggas, Princess of Wales, Hero of Stoke Newington, Cherub, Princess Teck, Nil Desperandum, and Lady Dorothy. Mr. Jellicce, gardener to F. Gossage, Esq., Camp Hill, Woolton, Liverpool, second, with larger blooms, not so neatly finished. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, Stoke-on-Trent, third. The Japanese blooms were not of huge size, but possessed colour according to the varieties, being fresh, and well staged. The names were Etoilc de Lyon, Vice-President Audiguier, G. C. Schwabe, Mrs. E. D. Adams, Alberic Lunden, Viscountess Hambleden, C. Davis, Mrs. C. H. Payne, Mrs. C. Wheeler, W. H. Lincoln, W. Seward, Golden Wedding, Viviand Morel, Mdlle. Marie Hoste, Mrs. F. A. Spaulding, E. W. Clark, Princess Victoria, and Lord Brooke. Mr. Heany, gardener to H. G. Schintz, Esq, Mossley House, Liverpool, second with heavy blooms. Mr. Shoesmith, gardener to M. Hodgson, Esq., Croydon, was a close third.

Mr. Blair won the premier award for twelve incurved with medium sized fresh examples. Mr. Coombes, gardener to the Earl of Dudley, Himley Hall, was second; Mr. Jellicoe third. For six incurved Mr. Shoesmith was first, Mr. Jellicoe second, and Mr. Walker, Hull, third. Mr. Heany won with twelve Japanese, Mr. Jellicoe second. The last named won with six Japanese, and also for six reflexed. Mr. C. Scott, Sheffield, second in the latter class. Messrs. Scott and Redmill were the principal winners in the local classes. Mr. Broomhead, Leopold Street, Sheffield, won all the first prizes in the amateur classes, staging Street, Sheffield, won all the first prizes in the amateur classes, staging remarkably good blooms.

Groups of Chrysanthemums were of moderate quality, the best coming from Mr. W. Redmill, gardener to J. G. Lowood, Esq., Five Oaks, Sheffield. Mr. C. Green, gardener to Sir H. Watson, Shirecliffe Hall, Sheffield, was second. Mr. C. Scott, gardener to J. Colley, Esq., Sheffield, had the best specimen Japanese, Mr. E. Green the best

incurved, the various members of the Rundle family. Mr. G. Walker arranged a remarkably pretty group of miscellaneous plants in the amateurs' division, winning premier honours easily.

BOLTON.—NOVEMBER 17TH AND 18TH.

THE seventh annual Show of the above Society was held in the Albert Hall, and from every point of view was better than any previous exhibition seen in Bolton.

For twenty-four cut blooms, Japanese and incurved, six staged, Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, near Liverpool, secured premier honours with fresh and well coloured blooms. Liverpool, secured premier honours with fresh and well coloured blooms. The Japanese were Chas. Davis, Etoile de Lyon, Florence Davis, Viviand Morel, Marie Hoste, Boule d'Or, G. C. Schwabe, E. Molyneux, Mrs. F. Jameson, Viscountess Hambleden, Excelsior, and Col. W. B. Smith, and the incurved Queen of England, Mons. R. Bahuant, John Lambert, Rt. Cannell, Baron Hirsch, Empress of India, Miss M. A. Haggas, Princess of Wales, John Salter, Mrs. Heale, Alfd. Salter, and Violet Tomlin. The second honours fell to Mr. J. Craig, gardener to A. Heine, Esq., Fallowfield, Manchester. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, third. In the corresponding number of miscellaneous blooms Mr. J. Craig was a good first. Mr. J. Bracegirdle. miscellaneous blooms Mr. J. Craig was a good first. Mr. J. Bracegirdle, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, was second, and

Mr. R. Pinnington third.

For a stand of blooms arranged for effect Mr. J. Abbot, gardener to Jas. Musgrave, Esq., jun., first; Mr. W. Wainwright, gardener to Mrs. J. K. Cross, Fernclough, Heaton, second; and Mr. G. Rawson, gardener to John Heywood, Esq., J.P., The Pike, third. The latter had in the local class the premier incurved bloom with Empress of India, the prize for premier Japanese going to Mr. T. McGrigor, gardener to M. Howarth, Esq., jun., for Viviand Morel. In the local classes for twenty-four blooms a silver cup was presented by the President, R. K. Cross, Esq., and a spirited competition was the result, the prize being secured by Mr. J. Callon, gardener to John Harwood, Esq., Woodsleigh, for a very fine stand. Mr. Chas. Jones, gardener to Mrs. Shaw, Wellesley House, and who won a cup in this class last year, was a close second. The third position was taken by Mr. John Wainwright, gardener to Mrs. E. Cross. For twelve incurved Mr. Callow was again first, staging capital examples, Messrs. J. Wainwright and Chas. Jones following with good stands. For twelve Japanese Mr. T. McGrigor exhibited fine, well built flowers, Messrs. W. and J. Wainwright being second and third.

There were two groups of Chrysanthemum plants arranged, first prize, including silver medal of Royal Horticultural Society, being taken by Mr. J. Pownall, gardener to Martin Musgrave, Esq.; and the second by Mr. W. Wainwright. The miscellaneous groups, 10 feet diameter, The first prize carried with it the bronze medal of the were good. R.H.S., and this was won by Mr. Chas. Jones with an admirable arrangement, harmonising thoroughly in every way. The second was taken by Mr. J. Wainwright with a pretty group well arranged, but containing too much colour for the size of group; the third, also good, being taken

The trained and specimen plants were most creditable, the principal prizetakers being Messrs. H. Shone, gardener to J. W. Makaut, Esq.; Mr. J. Hicks, gardener to Mrs. Haslam, Ravenswood; J. Pownall, J. Wainwright. Primulas, Roman Hyacinths, and table plants were all in fine condition, the winners being Messrs. R. Allen, J. Callow, Geo. Cross, gardener to E. Thwaites, Esq.; and J. Pickthall, gardener to T. H. Thwaites, Esq. The ball and bridal bouquets were excellent. Mr. J. Moseley, Halliwell, securing both prizes, which were well deserved.

Black and white Grapes were fairly well shown, the winners being Messrs. Hicks and W. Wainwright. For vegetables the prizes went to Mr. G. Corbett (gardener to A. Knowles, Esq.), Mr. R. Fairhurst, Mr. J. Barnes, Mr. J. Fletcher, and Mr. R. Barlow.

Special prize for Roman Hyacinths, given by Messrs. Clibran, Altrincham, was taken by Mr. G. Cross. Messrs. Clibran & Sons staged four dozen blooms of Chrysanthemums, representing some of the newer varieties. Mr. James Oakes. Darley Hall Potteries, had a fine display varieties. Mr. James Oakes, Darley Hall Potteries, had a fine display of pottery. The prize for dinner-table for eight persons, arranged with fruit and flowers for effect, was taken by Mrs. H. Walmesley, Bradshawgate, Bolton.

HUYTON AND ROBY.—November 18th.

THE second annual Exhibition of the above Society was held on Saturday in the Huyton Park Hall, and was a great advance of what was held last season, the competition in the cut bloom classes being very keen. The principal prizetakers included Mr. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, who took first prizes for twenty-four-blooms, twelve incurved and twelve Japanese, twelve blooms reflexed and Anemone flowered, six incurved in three varieties and six Japanese in three varieties, two Palms, two Ferns, six pots Roman Hyacinths, three dishes and one dish Culinary Apples, three dishes and one dish of Pears, one dish dessert Apples; and seconds for twelve incurved, six Japanesc and six incurved, three dishes dessert Apples, and six table plants. The second in the twenty-four bloom class was capen of Thos. Eaton, gardener to Jno. Parrington, Esq., Roby Mount, Roby. The second in the twenty-four bloom class was taken by Mr. was also second for twelve Japanese and first for two splendidly coloured bunches of Lady Downe's Grapes. Mrs. Parrington taking the first prize for the best arranged Epergne with a pretty combination of Roman Hyacinths and Salvia splendens and Maidenhair Fern as foliage.

Mr. J. Rose, gardener to J. Kitchen, Esq., Fernwood, Huyton, secured honours with twelve Japanese and twelve incurved, also for trained plants, the award of merit being granted as well. For six Japanese and six incurved Mr. W. Wharton, gardener to Jos. Royston, Esq., Huyton,

was first, also for six Primulas and Poinsettias. The prizes for plants, incurved and Japanese, six of each, and group of plants, went to Mr. W. Lyon, gardener to A. M. Smith, Esq., Bolton Hey, Roby; and for white Grapes, one Orchid and three dishes dessert Apples, to Mr. W.

Oldham, gardener to Jos. Beecham, Esq., Ewanville, Huyton.

An effective group of plants and a choice one of Chrysanthemums was arranged (not for competition) by Mr. J. Wattie, gardener to J. A. Willcox, Esq., M.P., Parkside, Huyton; certificates granted. The trade were represented by the Liverpool Horticultural Co., Garston, for fine stand of Orchids and plants in variety, and to Mr. H. Middlehurst, seedsman, Manchester Street, Liverpool, for well berried Solanums and other plants.

FRUIT FORCING.

Peaches and Nectarines. - Earliest Forced House. - The trees having been started, they must have sufficient water at the roots, examining the border for ascertaining its condition, and if it is doubtful whether the soil be moist enough a good watering must be given, supplying liquid manure to weakly trees. Fire heat should only be employed at night to exclude frost, and by day to insure a temperature of 50°, above which ventilate freely. A close, vitiated atmosphere must be avoided after the buds commence swelling, syringing the trees in the morning and early afternoon of bright days until the buds begin to show colour; then maintain a suitable moisture by damping the paths and borders. Allow a little ventilation by the top openings of the house constantly. Aim at slow, gradual development in the growths to secure sturdy well expanded blossoms, with strong stamens and anthers well laden with pollen, and the pistils stout and perfect. This is essen-

tial to a good set of fruit.

Second Early Forced House .- The trees to be started for affording fruit in May or early in June, must now be kept as cool as possible. The lights having been removed, they may remain off until the weather sets in very severe or snow falls, when they should be replaced, after thoroughly cleansing, repairing, and, if need be, painting. The trees will require little pruning if they have received proper attention in disbudding, reserving only the growths needful for extension and next year's crop, and cutting out that which has borne fruit this year and is not required. If the trees have been affected with brown scale nothing assists in its destruction better than exposing the trees to frost. Where the lights are fixed the trees may be syringed with water at a temperature between 140° and 160°. This will bring off most of the scale, then the trees can be washed with a solution of softsoap, 3 or 4 ozs. to a gallon of water, using a brush to dislodge the scale, and being careful not to dislocate the buds. In bad cases it is advisable to go over the trees a second time before they are tied to the trellis. Plenty of space must be left in the ties for the swelling of the branches. Remove the remains of mulching and any inert surface soil; supply fresh turfy loam about 2 inches deep, chopped moderately small, and adding a 6-inch potful each of steamed bonemeal and Thomas's phosphate, with as much as of both of wood ashes to every 3 bushels, incorporating well. Ventilate to the fullest extent except when the weather is severe, and see that the soil is kept properly moist.

Third Forced House.—The trees in this structure will be started with the advent of February to ripen their fruit late in June or early in July, and they should now be subjected to the same treatment as advised for the trees in the second early house. It is a bad practice to leave houses and trees unattended after the leaves fall until the time of closing the structures, and favours insect pests immensely. can never be handled so safely, either for the needful cleaning and pruning or eradication of insects as when the buck are least active, which is as soon as the leaves have fallen, and the insects are reached before they are obliged by cold to make their retreat to safe quarters. Such pests as brown aphis live on the growths constantly. Any shoots infested should be cleansed with a brush dipped in tobacco water. It is a common practice to use houses of this kind for plants, especially Chrysanthemums; but it is fatal to that rest so essential to the success of Peach trees, and a primary cause of the buds subsequently dropping. The better plan is to let the water run out of the hot-water pipes, and

remove the roof lights.

Fourth House.—This can hardly be termed a forcing structure, yet there should be means of affording a genial heat when the trees are in blossom, and for accelerating the ripening of the fruit as may be necessary, also for maturing the wood in cold districts. It may be analogous to a Peach case or covered wall, against which the choicest midseason Peaches and Nectarines are planted and trained, but the trees do better on trellises about a foot from the glass. The house being closed early in March, the trees will ripen their fruit early in August and September if kept cool. They are now leafless, and should undergo the process advised for the second early forced trees in every particular. It is an old and excellent practice to empty the hot-water pipes and remove the lights, leaving them off until the blossoms begin showing colour, or admit air to the fullest extent in all weather, for no amount of frost will injure the wood provided it is thoroughly ripe.

Late House.—Cut out all the wood that has borne fruit if not otherwise required. Do not allow the soil to become dry, but give a thorough soaking of water if necessary. If the wood does not ripen well employ heat by day with moderate ventilation, and turn it off in the afternoon, so as to have the pipes cool before the night, and then open all the ventilators unless keen frost prevails. The house must otherwise be kept cool by free ventilation and the fallen leaves cleared away. Late Peaches are valuable, and when well grown good in quality. If any of the trees grow too luxuriantly root-pruning and lifting must be attended to without delay.

Unheated Houses.—The leaves of the trees in unheated houses against south walls are off except where the trees are unsatisfactory, and such should be lifted and the roots laid in fresh rather strong calcareous compost nearer the surface. With proper treatment the crop for next year will not be prejudiced. In lifting the trees do not manipulate the roots too much, and do not lift them before the wood becomes firm. If the drainage is defective it should be rectified, and soil of an unsuitable nature removed. It is, however, almost useless trying to patch up bad borders, and it would in most cases be more satisfactory to make new ones. A 4-inch tile drain should be at the base, with a proper fall and outlet to carry off superfluous water, with a foot of rubble over the bottom of the border and above the drain, and if the drainage is covered with a layer of old mortar rubbish it will insure the keeping of the rubble open and supply lime. About 24 inches depth of soil is ample, but it will need to be 30 inches at first to allow for settling.

Peaches and Nectarines like a firm soil. This should be strong, preferably a calcareous clay-loam—the top 3 inches of a pasture, and where the formation is limestone or chalk. If the soil is light add to it a fourth part of clay-marl, dried and pounded, incorporating well together. Soil of this character usually induces a stout short-jointed growth, and the fruit is large, high coloured, heavy, juicy, and full flavoured. The border need not be wider than a foot beyond the exten-

sion of the roots in the first instance, adding to it as the roots extend.

A narrow border is in many respects superior to a large one. The restriction of the roots entails more frequent supplies of water and liquid nourishment with top-dressings and surface mulching, but the results are better than in the wider border, as the food is supplied fresh, and the trees are completely under control. The wide border may have some part sour before the roots reach it, and in any case its freshness is gone, and roots never thrive so well in stale as in fresh loam. If any new trees are wanted they should be procured and planted without delay. In a Peach case fruit can be had from early July to the beginning of October by a proper selection of varieties—say, Waterloo, Hale's Early, Dr. Hogg, Crimson Galande, Dymond, Goshawk, Royal George, Alexandra Noblesse, Grosse Mignonne, Bellegarde. Gladstone, Sea Eagle, and Golden Eagle—excellent Peaches in every respect. Suitable Nectarines are Early Rivers, Lord Napier, Rivers' White, Elruge (some prefer Stanwick Elruge), Newton, Dryden, Pine Apple, Spencer, and Victoria.

THE KITCHEN GARDEN.

Globe Artichokes.—Frosts have reduced the leaves considerably, and it is now possible to take the requisite protective measures. either leaves covered with strawy manure to keep them from blowing about, litter or ashes are banked well up around the plants, the best of the crowns will be either killed or badly crippled during the coming winter. When the best crowns are damaged by frosts, the early growths are weak and the flowering stems feeble and late accordingly. As a rule only a very small per-centage of seedling Artichokes are worth saving, and if those of a worthless character have been duly marked, they may

well be rooted out, those reserved being protected.

Protecting Celery.—Unless Celery is well moulded up, it is a very difficult matter to afford proper protection against severe frosts. It is the stalks and coarser midribs that suffer most, and once they are badly frozen decay soon spreads. Instead of leaving the whole of the leaves exposed, the stalks only be covered with soil, the wiser plan is to bank up the soil sufficiently high to bury about one-half of them, and the rest, unless in very cold localities, may well be left unprotected. times experience very severe frosts early in December, and no time should be lost therefore before completing the earthing up. Comparative dryness of soil is essential, and the ridges should be well rounded. Fresh dry straw and bracken covered over the tops of Celery will ward off severe frost, but if in a wet state it may easily do more harm than good. If protection must be afforded, let it be in the shape of boards nailed together in the form of the letter V, and inverted over the rows whenever necessary, as being the least trouble and the most effective in

Celeriac .- The "bulbs" of Celeriac are far from being hardy. They may be protected against a moderately severe frost by drawing the soil up to them much as Potatoes are moulded up, but in order to be prepared for all emergencies some portion at least of the crop should be lifted, and after having the tops trimmed off be stored in a cool shed, enough fine soil or sand surrounding them to afford some protection from frosts, and also to prevent premature shrivelling. Celeriac may also be kept in a "clamp" or heap in the open, all being well covered with straw and banked over with soil.

The Broccoli Supply.—Autumn Cauliflowers have not held out nearly so well as usual, and autumn Broecoli have also been somewhat coarse as well as earlier than desirable. Late plants of Veitch's Autumn Protecting are doing good service, but even these commenced hearting prematurely. What are left should be taken care of. Very severe frosts may spoil them, merely covering the hearts with large old leaves being little avail against 10° or more of frost. They will pay

well for being lifted with a fairly large ball of soil about the roots, and then bedded in somewhat closely together in the pit of a cool vinery, or in a deep brick pit, turf pit, or wooden frame. Some of the oldest leaves may be removed, and if the tops do not smother each other, the hearts will keep fresh for several weeks. Lifting and either laying or suspending in either a cellar or shed will be the next best plan to pursue, especially in the case of those with hearts nearly or quite fully grown. If those with hearts only just commencing to form were also lifted and stored in a pit or vinery, the roots being firmly surrounded with rich soil kept constantly moist, these would soon recommence active growth, and a good supply of small hearts be had at midwinter and later. Snow's Winter White seldom hearts in before February or March, but this season there is a prospect of its being very much earlier. Some few hearts are already showing, and if a portion of the breadth of this variety were lifted and stored under glass, as advised in the case of late hearting Autumn Protecting, there is every likelihood of their well repaying for the trouble taken with them.

Successional and Late Broccoli.—In most cases the main crop and late Broccoli have grown very strongly. Frost have given the desired check to this late growth, but all the plants are so full of sap that they will not withstand a severe frost. It is the stems however that are the most susceptible of injury, and these should be protected. Heavily moulding up the stems without greatly damaging the outer leaves would be a desirable practice, but as a rule the rows are arranged far too closely together for this to be done. Heeling in or laying down Broccoli renders the plants hardier and assists in prolonging the supply.

APIARIAN NOTES.

THE WEATHER—FEEDING.

WITH the exception of Punics, which are still working, all the other bees have been very quiet during the past month of changeable weather. Frost has been frequent, but of short duration, the lowest temperature being 21° on several occasions. Up till November 13th the barometer was exceedingly high, standing at 30 40 for several weeks; on the 14th it began to move, and on the 17th it registered 28 10, with the thermometer at an early hour at 50° with a drizzling rain, and bees active on the wing. impossible to say what the coming winter will be, but judging from the actions of certain animals, I should not be surprised it will be of a mild noture.

If favourable weather prevails, the present is a good time to change floors, for when solid they will be more or less affected with damp, which is very injurious to both bees and hives. As I find the hives are much lighter than they were two months ago, it will be advisable to pay attention to the stores which the bees have, and if short, supplement them by feeding with a few pounds of syrup.

HINTS FOR BEGINNERS.

As there are numerous inquiries about the Lanarkshire storifying hive, and as it is the most fitting season for amateurs to be making preparations for the next summer, I have resolved to give instructions on my favourite hive, which I have used for well nigh half a century. In doing so I will not set forth the hive as one of an ornate character, but as one specially adapted for the preservation of bees, working them to their own and their owner's best advantage, both as a pastime and from a commercial point of view. It is many years since I abandoned the fancy apiary for one of utility; but for all that the Lanarkshire hive can be made as comely in appearance as any hive. At one time I used much fretwork, and otherwise adorned my hives with fancy painting; but I soon tired of such work. Having to move my hives long distances to the Heather in common conveyances by land and water taught that a hive to be suitable and profitable must be one of little compass, and which could not be easily damaged.

I have still to take my bees to the Heather at Leadhills, about fifty miles by road and by rail, and if our hives were but a little larger they would one year with another be a losing concern. I once started from home at three o'clock A.M. with ten hives and some other articles upon a barrow to catch the boat at the Braemielaw (about nine miles) at 7.20. On reaching Lamlash the tide was ebbing, and the captain deemed it unsafe to land us at the quay, so we had, with the assistance of those on board, our live cargo put afloat in a ferry boat; but as there was no landing place, and the tide being against us, we had no alternative but to wade into the sea and pull the bees ashore on the barrow. Another half or three-quarters of a mile further up the "brae" I had my bees safely set down and at work a little after two o'clock. The reader may consider whether there is another hive that could be transmitted the same distance, and in such a manner.—A LANARKSHIRE BEE-

TRADE CATALOGUES RECEIVED.

Hogg & Robertson, 22, Mary Street, Dublin.—Forest Trees, Conifers, Fruit Trees, and Roses.

Lévêque & Sons, Ivry-sur-Seine, Paris.—Roses, Chrysanthemums, Dahlias, and Other Plants.

*All correspondence should be directed either to "THE or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened We request that no one will write privately unavoidably. to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (W. F. G.).—Cooke's "Manual of Botanic Terms" is what we think you require. It is published by Mr. Hardwick, 192, Piccadilly London, and can be obtained through a local bookseller. It is inexpensive. (G. F.).—There is no book published of the exact nature you appear to require.

Letter (J. Taylor).—Your letter is received, and the enclosure has

been forwarded in accordance with your desire.

Aucuba japonica (W. M. B.).—The pollen-bearing form of this shrub was introduced by Mr. Fortune in 1850.

Cypripedium insigne (W. E. Tidy)—It is not very unusual for Cypripedium insigne to carry two flowers on one stalk under superior cultivation, and no doubt you have before grown the plant well.

Viviand Morel Sport (G. Marr).—The sport of which you send a bloom is of no value. There are many better, but all are more or less inconstant, and appear to refuse to be "fixed" for purposes of increase and cultivation.

Exhibiting Chrysanthemums (J. C. M.).—In a class for "twenty-four varieties (cut blooms) Japanese," a stand containing two blooms of any variety would be open to disqualification on the ground that only twenty-three varieties would be included.

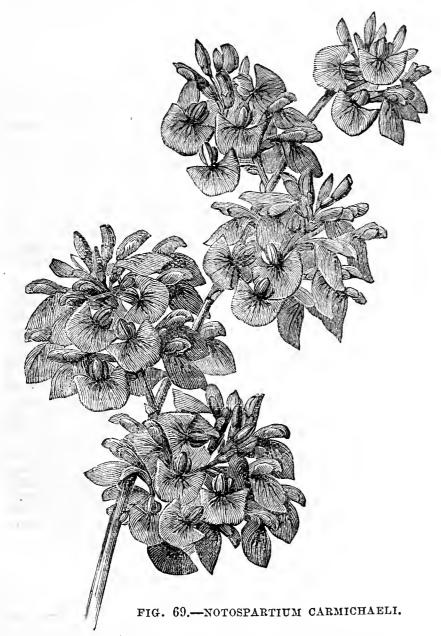

Exhibiting Chrysanthemums (A. T.).—You ask if an exhibitor would be disqualified by having an incurved Japanese amougst the incurved blooms in a class described as follows: "For the best twentyfour cut blooms, viz., twelve incurved and twelve Japanese, not less than twelve varieties, and more than three of any one variety." Such a class would admit twelve Japanese blooms, incurved or not, but admittedly Japanese, and twelve incurved blooms, not of Japanese origin; thirteen Japanese blooms would not be within the conditions, and would invite disqualification.

Bone Manures (F. J.).—The kind you have obtained is presumably the same as steamed bone flour. An analysis, showing the constituents of manures, should be supplied by vendors. Your mixture would be good for general use, but if trees or plants are too slow in growth they could be stimulated by a supplementary dressing of finely powdered nitrate of soda, at the rate of half an ounce or little more to the square yard in April, and as may be further needed; but the potassic and phosphatic manures must be in the soil as well for the best

permanent results to be forthcoming. Tuberous Fungus Found Under an Old Oak Tree $(A.\ S.)$.— The tubers are not those of the true edible Truffle (Tuber æstivum), nor belong to that genus, yet to the same order — Tuberacei. The true Truffle is black outside, and the flesh, so estemes for flavouring, is at first whitish and tender, but afterwards becomes powdery, and not unlike a Puff-ball, to which, however, it is not closely related. Your tubers are those of Elaphomyces variegatus (muricatus), Vitt., white outside and black inside, with white interlacing (variegated). This Truffle—all the Tuberacei are popularly termed Troffles—was formerly used in medicine, but is now discarded. Whether it is edible or not we have no experience, but field mice are extremely fond of the tubers, and are continually scratching about for them. The botanist is guided to where this Truffle is to be found by the appearance of a parasitic fungus (Torrubia ophioglossoides, Tul.), the spawn of which grows over a common moss (Mnium hornum, *Hedw*.), and is running in search of the Truffles (Elaphomyces variegatus), which usually grow from 4 to 5 inches beneath the surface. If there are no Elaphomyces in the soil, the mycelium of the Torrubia perishes, but in most woods where the moss grows the Truffles are generally found.

Weed on Tennis Lawn (J. R.) —There are several weeds called Gill-run-the-ground. Had you sent a portion we might have recognised it; but that is not material, as you do not wish to interfere with the ground, beyond applying something to the surface. If your employer does not object to the grass being browned a little, as it must be if the weeds are to be killed or prevented increasing, and the grass ultimately encouraged, you can try the following mixture:—Sulphate of ammonia, 3 cwt.; kainit, 2 cwt.; reduce to fine powder, mix thoroughly, and apply in dry weather—that is, with a prospect of no rain or snow falling for some time. The above amount is for an acre. About the middle of next February, or as soon after as the ground is thawed, you may apply 5 cwt. per acre of dissolved bones. The grass ought to be better next year and the weeds fewer.

Notospartium Carmichaeli (A. B. C.). - You are right in assuming that Notospartium Carmichaeli has been figured in the Journal of Horticulture, but as the plant is not well known we reproduce the illustration. Notospartium Carmichaeli is a New Zealand shrub of slender habit, with somewhat flattened leafless stems and branches, or with the leaves reduced to scale-like proportions. The neat pea-shaped rosy-purple flowers are borne in dense clusters on the stems as shown in the woodcut (fig. 69). In some districts this plant no doubt will be

found quite hardy, but in any case it should be worth a place in a greenhouse with other plants from the southern hemisphere, and requires the treatment accorded to hardwooded plants.

Cyclamen Roots Destroyed (Cycla) - The roots of your plants are being eaten by the larvæ of the destructive weevil Otiorhyncus sulcatus. These weevils feed at night, and with diligence and the aid of a lantern many of them may be caught. Plants having their roots eaten to such an extent that they can be "lifted out of the pot" should be taken out and immersed in a decoction of hellebore, made by placing 2 ozs. of the powder in a gallon of cold water, then steadily brought to the boil, and when cool enough the roots placed in it. The fresh soil should be charred over a fire and then properly moistened before being used.

Chemical Manures for Zonal Pelargoniums (Northants). There is no such thing outside the imagination and the chemists laboratory that favours any particular part of the plant or flower, for no one chemical substance is a manure in itself, but is dependant upon another for its efficacy. To enable a plant to produce fine trusses it must be stored with nutrient matter by food supplied to the roots and converted into the essential elements in stout, thick-textured, healthy, clean leaves. Here is a mixture for this purpose after the plants are well rooted in sweet firm soil :-- Three parts pure dissolved bones, two parts nitrate of potash powdered, one part sulphate of lime, ground; mix thoroughly, and keep in a dry place. Use a thimbleful on the surface of the soil in an 8-inch pot, other sizes in proportion, spreading evenly, and wash in. Repeat about every fortnight or three weeks, as growth is required. Grown in plenty of light and air the plants will throw up grand trusses. That is one of the great secrets, and when they are beginning to open out add half a part of sulphate of iron to the

mixture—that is, taking the proportional parts of the whole, and it will bring out the size and colours to perfection.

Names of Fruits.—Notice.—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (Dr. Wallace).—1, Waltham Abbey Seedling; 2, Reinctte de Caux; 3, Cockle's Pippin; 4, not known, quite second-rate; 5, Scarlet Nonpareil; 6, probably a seedling of no value. (Coombe Park).—1, Vicar of Winkfield; 2-3, Scarlet Pearmain; 4, Lady Apple. (N. H. P.).—General Todleben. (J. H.).—Large Apple, Dutch Mignonne; small one is a local variety. (F. E.)—Rymer. (Hills).—The fruit resembles Golden Queen imperfectly ripened. (A. B.).—1, Norfolk Bearcr; 2, Local; 3, Golden Russet. (T. N. R.)—1, Grenadier; 2, Manks Codlin; 5, Greenup's Pippin; Pears, 3, Josephine de Malines. The others are all rotten. A parcel has been received from Hitchin without a letter or address. Hitchin without a letter or address.

Names of Plants.-We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (H. M.).—Lycaste Skinneri. (M. D.).—1, Tecoma capensis; 2, Agave americana. (L. B.).—Veronica Andersoni variegata. (F. Geeson).— So far as we can judge from the imperfect dried specimen the Grass is Triticum repens. The other is apparently an Eryngium, but it is impossible to identify the species, the specimen being imperfect.

PROFITABLE LIVE STOCK.

So important is the question of the best cow for the dairy farmer, and how to feed it, that we return to this subject this week, in view of touching a few more points of practice, with some facts bearing upon them.

If, as we hold, the keeping of an inferior cow is both foolish and wasteful, it is surely owing to want of thought, a failing to grasp this fact in its full significance, that such animals predominate everywhere. All the food that a cow consumes, beyond what is necessary to sustain life, should go to promote a fully sustained milk yield up to a given standard, both in quantity and quality. The average milk yield in the British Isles is 440 gallons per cow, which means the yield ranges from 300 gallons upwards to 1000 gallons or more. A cow yielding the lesser quantity is kept at a loss, at the greater quantity the profit is so high as to exceed the bounds of all ordinary calculations. Granted that 1000 gallons per cow is a yield so extraordinary and exceptional that only a few of such marvellously deep milkers are met with in our best herds, yet we can afford to fall from that high figure to a minimum of 500 gallons and still have profitable cows. But no sensible man can possibly rest contented even with such cows; the net profit upon them cannot be much more than £4, and the yield is in reality a very low one. Ten quarts daily for 200 days make up the sum of it, yet it falls below that. At the lowest computation a cow should be in milk quite 250 days out of the 365 days of the year, and we have often told of a small black Kerry cow which we had from Dr. Hogg's herd that gave 16 quarts of exceptionally rich milk daily. It was a mere pigmy beside a huge Shorthorn, which at best only gave 10 quarts daily—not by any means a fair equivalent for the food consumed by it. Such large animals must be deep milkers to be profitable. Extra outlay upon food only answers for well-bred cows, it is comparatively wasted on mongrel breeds.

According to a high authority an inferior cow costs £14 a year for its food, and yields a calf worth £1, and 400 gallons of milk, which at 8d. is £13 6s. 8d., or a total of £14 6s. 8d., profit 6s. 8d. A superior cow costs £17 a year for its food, yielding in return a calf worth £2, and 700 gallons of milk at 8d., or £23 6s. 8d —total, £25 6s. 8d.; profit, £8 6s. 8d. If the milk of both cows was used for butter or cheese making, the difference in the result would be much more in favour of the superior cow. It is also obvious that if the milk producer could dispose of it to the consumer at the present ordinary retail price of 4d. per quart his profits would be doubled. Truly a grand business is that of the retailer of milk! the eager competition, the headlong rush of a dozen or more milk carts along every suburban street or road of the metropolis twice daily is not to be wondered at, even if new milk only was sold. But there is no doubt that much separated milk is mixed with it and sold as new, and police court reports often tell of an addition of 30 or 40 per cent. of water.

For the production of cheese or butter, quality is a prime factor, dependent both on food and breeding. For example, the milk of a Jersey cow yields 25 per cent. of cream, and when we have such richness in combination with the desirable average of 700 gallons the result is certainly satisfactory. Cows of this breed frequently yield much more than this; the famous Jersey cow "Luna's" yield for three consecutive years was 876, 898, and 816 gallons, an average milk yield per year of slightly over

863 gallons, or almost double the ordinary annual average yield. For the home farmer a herd of Jerseys is highly desirable, though we must confess to a preference for the larger and more robust Guernseys. Certainly for rich milk, for deep milking, and for a well sustained yield the Guernsey ranks very high.

For the ordinary dairy farmer we give preference to our favourites the Red Polled Suffolk cows, in which we have in admirable combination deep milking and beef production. The milk is rich, and the square fleshy frames are easily fattened. Some of the best cows yield upwards of a thousand gallons yearly, and the steers are equally remarkable for early maturity. In the Whitlingham herd of this breed—a very large one especial care has been given to the selection of both males and females from famous milking dams, with results so remarkably in favour of an increased milk yield as to carry conviction of the value of selection both for milk and for beef.

WORK ON THE HOME FARM.

During the present and three following months butter difficulties are wont to crop up, and all possible care must be exercised to guard against them. For the daily churning avoid the milk from stale cows. Under good management there is a fresh cow or two coming in every month, and it is from their milk that cream for the daily churning should be taken. Correct any tendency to the acridity that so often renders butter unpalatable in winter by using a small teaspoonful of finely should be taken. powdered saltpetre to three gallons of cream; a small pinch between finger and thumb is sufficient for the daily churning. Just a modicum of salt in the form of brine helps the flavour, but this requires a careful hand, as the order which so frequently comes from head quarters of "no salt in the butter" can only be ignored with advantage by a really skilful butter-maker. It is just a question of palate tickling worthy of best efforts, and a compliment upon good butter at midwinter is certainly worth trying for.

Look well to the churning, have no bewitched cream, at which one after another tries their hand for hours without bringing the butter. Temperature must have attention; 65° is the best temperature for cream when it is put in the churn during winter. This is easily and best managed by placing the cream jar in water slightly above that tempera-Warm the churn with water at about 70°, which let run out just before putting in the cream. There should then be no difficulty in getting the butter quickly. The churning may be done more briskly in winter than in summer, but there must be no violent or abrupt clashing about of the cream at any time. Begin slowly, gradually increase the speed, and when the butter grains appear gradually reduce the speed.

Never break the grain in churning, or the butter will not keep sweet. Equal care must be taken with the cows and their food. We m We must have a clean cow house, clean hands for milking, and clean milk pails. For food use the best meadow hay, Carrots, bran, crushed oats, Cabbage, or Thousand-headed Kale. The bulk of food is in the hay, with from a gallon to a peck of bran, and half that quantity of oats at milking time. A little Palm-nut meal may be added with advantage, but care must be taken not to use enough Cabbage to affect the flavour of the milk.

REMARKS.

12th.-Almost cloudless throughout.

13th.—Slight fog till 10 A.M., but almost cloudless throughout.
14th.—Very wet fog all day; slight showers in afternoon; steady heavy rain from 6.15 P.M.

Continuous heavy rain till 4 A.M., then overcast and dull; continuous drizzle from 11.30 A.M. to 3 P.M.; fair evening.

Overcast morning; fair afternoon with gleams of sun; cloudy evening and rain at midnight.

rain at midnight.

17th.—Slight showers early; overcast from 8.30 A.M.; frequent sunshine from noon to 3 P.M. but a very slight shower about 1 P.M.; overcast after, with high wind and heavy rain between 5 and 7 P.M.

18th.—Rain from 3 to 7 A.M., then overcast and rain from 1.30 P.M., changing to snow about 3 P.M., which continued till after midnight, with a violent gale.

Temperature below the average, rainfall considerably above it. The total rainfall this year, 16.85 in., is very nearly as much as fell in the whole of the year 1864. It is therefore clear that 1893 cannot be unprecedentedly dry.—G. J. SYMONS.

I AM very sorry to be so late in bringing out this analysis, but having missed my opportunity early in the year through press of other work, I have delayed completing it until the show time came round again, thinking it would then be of more interest than during the summer or early autumn months. At the Exhibition held by the National Chrysanthemum Society at the Royal Aquarium, Westminster, in November, 1892, the display of incurved cut blooms was the smallest of which I have any record. There were, however, rather more Japanese than at the previous Show.

The following short statement gives the number of cut blooms staged in the incurved and Japanese sections at the eight exhibitions. The flowers shown in the classes for six blooms of any one variety were not tabulated for the analysis, and therefore have not been included in the totals.

	1885	1886	1887	1888	1889	1890	1891	1892
Incurved Japanese								
о шриново						2004		1000
	1674	2106	2185	2906	1604	3431	1802	1642

Now that I have a complete set of records for eight years to deal with, I am in a position to adopt a similar system of analysis to that so successfully employed when dealing with the last Rose and Dahlia analysis. This system I have endeavoured to explain at page 358. The steady going incurved Chrysanthemums will not be found in any way seriously affected by this improved methodindeed, the relative positions of nearly all the leading kinds remain practically as in the previous analysis. The table of the headstrong Japanese has, however, become greatly changed, and I trust improved since the last version of it appeared. I have gone most carefully into the places accorded these Japanese varieties, and endeavoured to give each its proper relative position in the list; but the changes in this section are so rapid, and there is such a large accession of new sorts every year, that I have in many cases only the records for a few years to guide me in placing them -indeed, the careers of many of these Japs are so brilliant, and yet at the same time so fleeting, as to make them in these respects more resemble butterflies than well regulated florists' flowers. However trying to the analyst these startling changes may be, they indicate, I must confess, very substantial progress. In order to give some idea of the extent of the changes referred to, and at the same time show how greatly the flowers themselves have improved, I may mention that only five out of the first twenty-four varieties in the table published only six years ago are now considered worthy of places among the first twenty-four in the present analysis. Of these five, Madame C. Audiguier has fallen since then from its position as the premier flower to No. 19, Jeanne Delaux from No. 3 to No. 10, and Val d'Andorre from No. 5 to No. 9. Boule d'Or stands pretty well the same in both tables, and Mr. Ralph Brocklebank, then quite a novelty, will be found at No. 16. If the advance made during the short space of six years has been so considerable as these alterations indicate, what glorious possibilities may there not be in store for us during say the next decade. Already there are not wanting indications in the comparative tables before me of the speedy downfall of many varieties at the present time in much request. Not only are the flowers of many of the modern varieties improvements on those of their predecessors, but the plants themselves, particularly as regards their heights and constitutions, show a decided advance as well.

Empress of India once more heads the table of incurved varieties, and deservedly so, as it appears to be a most reliable Chrysanthemum. In certain seasons Queen of England, Lord Alcester, and Golden Empress of India have not been far behind the premier flower, and have each at a single show been staged rather more frequently, but their records from year to year being more unequal, they do not seem to have any chance of seriously threatening its position. Lord Wolseley, Princess of Wales, Golden Queen of England, and Novelty have never before been better represented than they were last year. On the other hand Alfred Salter, Prince Alfred, Barbara, Jardin des Plantes, Hero of Stoke Newington, and Cherub at none of the preceding seven shows have been as seldom staged in competition. Miss M. A. Haggas and Violet Tomlin were also poorly represented.

In this section the newer varieties in the table, those dating from 1889 and after, are eight in number. Of the 1889 incurved Mrs. S. Coleman, No. 14, and John Doughty, No. 15, were equally as well shown as at the previous Exhibition; while Camille B. Flammarion has improved on its performance in that year. Madame Darier and Monsieur R. Bahuant, sent out in 1890, appear for the first time in the table, and both at No. 23, while Ami Hoste of the same year takes up a position at No. 37. The still newer kinds, Mrs. Robinson King and Robert Cannell, only introduced in 1891, will be found at Nos. 35 and 36 respectively.

Turning now to the table of Japanese varieties, as I said before I have done all in my power to deal with them as fairly and accurately as the data at my disposal will allow. The results generally can never, however, be considered quite satisfactory while this section remains in such a state of rapid transition. That grand Jap., Edwin Molyneux, it will be noticed, is for the time being the leading flower, closely followed by the snow white Avalanche. The following established kinds, if they can be so called, were less frequently shown than at any previous exhibition: -Mr. Ralph Brocklebank, Jeanne Delaux, Madame Baco, Madame J. Laing, Sarah Owen, Meg Merrilies, Carew Underwood, Mdlle. Lacroix, Baronne de Prailly, Belle Paule, Mrs. C. H. Wheeler, Mr. H. Cannell, Fair Maid of Guernsey, Criterion, Marguerite Marrouch, Thunberg, Lady T. Lawrence, Yellow Dragon, Mrs. J. Wright, Monsieur J. M. Pigny, Mrs. H. Cannell, Comtesse de Beauregard, and four others. This is a goodly list, and clearly shows how quickly many of the older favourites are retreating before the advance of the new comers, although, of course, this does not necessarily apply to every variety included in it, as the disastrous effects of certain seasons upon particular sorts is well known. But the question may naturally be asked, "On the other hand, what 'established' Japs. were last year staged oftener than at any previous show?" I answer, only two! Avalanche and Sunflower, the first an 1887 and the other an 1888 variety.

No fewer than twenty-one Japanese Chrysanthemums which have been sent out since 1888 already find places, and a fair proportion of them excellent places too, in the analysis. Looking carefully down the table we first come to Viviand Morel (No. 4), the sensation flower at the 1892 exhibition. This fine variety, although only sent out the year before, appeared in more stands than any other with the exception of Edwin Molyneux, Avalanche and Sunflower, which are from three to five years older. Except as regards its variability in colour it is indeed a sterling acquisition in every way. Next comes Gloire du Rocher, sent out only in 1891 at No. 6. W. H. Lincoln (No. 6), an 1890 Jap., was also last year surprisingly well shown. Florence Davis (1891) likewise made its mark, and is pretty sure this year to rise even higher than its present honourable position at No. 15. Louis Boehmer (No. 15)

of the same year was also equally well represented. This is an easily grown hirsute variety, but owing to its dull purple colour is not, I think, likely to advance in popular favour. Mr. A. H. Neve (1890) takes up a good place at No. 15. William Tricker (No. 27) also introduced in 1891, stands well considering that this is its first appearance in the analysis. Miss Anna Hartshorn (No. 31), first sent out in 1889, was shown last year three times as frequently as at the previous exhibition. We then reach an 1891 variety, Mdlle. Marie Hoste, which, although new to the analysis, already stands at No. 33. Mr. E. Beckett (1892) a still newer candidate for honours will be found at No. 39. Then lower down follow Coronet (1889) at No. 42, Alberic Lunden (1890) at No. 44, Mrs. Alpheus Hardy, that delicately constituted white variety with hairy petals which all growers are so proud to stage in good condition, also at No. 44, M. E. A. Carrière (1889) at No. 46, Beauty of Castlewood (1892) at No. 48, Pink Lacroix (1889) also at No. 48, Lilian B. Bird (1890) at No. 50, Cesare Costa (1890) at No. 52, Mrs. Irving Clark (1889) at No. 52, Eynsford White (1889) at No. 57, and lastly, Vice-President Audiguier (1890) also at No. 57.

The above new varieties are placed in the list according to the number of times they were staged at the Royal Aquarium Show last year, in order to give them every possible chance of competing with their more established brethren. There is, however, one disturbing cause affecting the very newest sorts in the table, but these only, for which I am unable to apply any correction, and yet which must in exceptional cases have considerable influence on the positions they are assigned, for I am told that in some instances it is impossible for a new variety to be well represented on its first appearance, owing to the limited number of plants available for distribution when it is first sent out.

The contrast between the incurved and Japanese sections is very marked, whether we take the average ages of the leading varieties or the changes from year to year. For instance, taking the first twenty-four sorts in each case we find the average age of the former to be twenty-one years, whereas the first twenty-four Japanese average only six years. As I have already stated, only five Japanese varieties which were classed among the first twenty-four kinds six years ago are now to be found in the same number of leading flowers. Treating the incurved varieties in (see p. 486)

the same way, there are, on the contrary, only five varieties which are not to be found in both analyses.

The relative positions of the different varieties in the following lists are dependent upon their average performances at the last five or less exhibitions as the case may be.

Reflexed.—Cullingfordi, King of Crimsons, White Christine, Cloth of Gold, Pink Christine, Golden Christine, Peach Christine, Chevalier Domage, Dr. Sharpe, Mrs. M. Sullivan, and Phidias.

Large Anemones.—Mrs. Judge Benedict, W. and G. Drover, Lady Margaret, Gluck, Empress, Miss Annie Lowe, J. Thorpe, jun., Gladys Spaulding, Grand Alvéole, Georges Sand, Acquisition, Fleur de Marie, and Nouvelle Alvéole.

Japanese Anemones. — Mons. C. Lebocqz, Jeanne Marty, Rodolpho Ragioniere, Fabian de Mediana, Nelson, Le Deuil, Madame Robert Owen, M. Dupanloup, Sœur Dorothée Souillé, Duchess of Westminster, Marguerite Solleville, and Sabine.

Pompons.—Black Douglas, Mdlle. Elise Dordan, Golden Mdlle. Marthe, Mdlle. Marthe, Prince of Orange, Marabout, President, Pygmalion, William Westlake, Rubrum Perfectum, St. Michael, and Cendrillon.

Pompon Anemones.—Antonius, Perle, Astria, Rose Marguerite, Madame Montels, Marie Stuart, Mr. Astie, Regulus, and Calliope.

NATIONAL CHRYSANTHEMUM SOCIETY'S SHOW, HELD NOVEMBER 7TH, 1893.

This was one of the largest exhibitions the Society has yet held; in fact, the number of Japanese Chrysanthemums staged in competition exceeded that at any previous show, with the exception of the Centenary Exhibition in 1890.

As it may be some weeks before my next Chrysanthemum analysis is ready for publication, it may be of interest if I give here the relative positions the following new varieties are likely to occupy in that analysis when it appears. Those new sorts only are mentioned which are not to be found in the foregoing tables.

Incurved.—Baron Hirsch, Madame Frederic Mistral, Brookleigh Gem.

Japanese.—Colonel W. B. Smith (the champion new variety of the Show), G. C. Schwabe, Charles Davis, Mrs. C. Harman Payne, Excelsior, Lord Brooke, William Seward, John Shrimpton, Violet Rose, R. C. Kingston, Amos Perry, Mr. Charles Blick, J. Stanborough Dibbens, Miss Dorothy Shea.

It only now remains to thank Mr. C. Harman Payne, Secretary of the Catalogue Committee of the National Chrysanthemum Society, for again kindly supplying the dates and raisers' names of some of the newer varieties in the tables.—E. M., Berkhamsted.

WANDERINGS IN WICKLOW.

THE county of Wicklow, if equalled in its splendid scenery by more remote parts of the west of Ireland, can scarcely be surpassed, and joining as it does to county Dublin, is of easy access from "the car-drivingest city" in the world. This might be considered a doubtful advantage resulting in an invasion of Nature's privacy, but such is not the case, for though many persons go to Bray, which may be aptly called the gate to Wicklow, few continue the journey beyond.

Bray, the so-called Brighton of Ireland, is singularly unlike the fashionable English resort. The ocean dashes against the fine esplanade unaccompanied in its solo by either hand organs or Ethiopian minstrels. True, the soft mournful notes of the Irish pipes, tuned by a blind musician, fall on the ear, but harmoniously so, though the missing link may perhaps be found in specimens of the Edie Ochiltree type, who pour out voluble blessings for prospective baksheesh; or mayhap the jaunting car driver has beguiled "yer honour" into patronising him, and you, though on pleasure bent, retain the frugal mind by omitting the pour boire, his look without words is as expressive as the verbiage of his brother over the water.

On leaving the station visitors cannot fail to be impressed by the bold front of Bray head, sharply outlined against the sky and backed up by the mountains, of which the Sugarloaf stands out pre-eminent. Striking off inland through the picturesque Alpinelike village of Enniskerry, where Fuchsia gracilis hangs gracefully round some cottage windows and Lobelia fulgens grows luxuriantly below, a few miles drive brings one to Powerscourt, a place of note in the gardening world, unrivalled in its setting amidst the mountains. An extensive range of glass on a plateau near the mansion is described and illustrated in "Thompson's Gardener's Assistant," and some fine groups of statuary embellish the terraced gardens, but a Scotch mist marred an all too brief visit, prohibiting any attempt to see the waterfall, one of the features of Lord Powerscourt's noted demesne. Time has wrought changes since I saw Powerscourt on an autumn day, and a detailed account of a visit then might be misleading now; yet the glorious panorama of lights and shadows on the eternal hills disclosed by the rifting clouds is changeless though ever changing. Mr. Crombie, who now wields the bâton over the gardens, is a Chrysanthemum man and a past exhibitor, when his huge blooms have given other competitors some anxiety. Other seats in the neighbourhood are those of Lord Monck and the Earl of Meath.

Starting again from Bray the rail winds round the head on a narrow rocky shelf, so narrow that one looks down a sheer descent of many feet into the clear blue water, curling its white crests round detached fragments of the rock, on by the village of Greystones, still skirting the sea till entering the Vale of Ovoca, of which Moore, the sad sweet poet of Ireland says—

"There is not in the wide world a valley so sweet
As the vale on whose bosom the wild waters meet."

From Rathnew Station via the village of Ashford, Ballycurry, the seat of Col. Tottenham is reached, this demesne of 1500 acres it is needless to say embraces much that is naturally beautiful, the chief point of interest being the Devil's Glen, a mountain gorge of several miles embosoming the tumbling and leaping river Vartry, happy in escaping the reservoir at Roundwood, the head of the glen, where the "City Fathers" have impounded it for the use of Dublin and the townships. Passes obtainable at the hotel at Ashford at a nominal charge, admit visitors to this enchanting piece of nature.

Near the mansion are the quaint old-fashioned gardens, on entering which one steps back a century at least, a labyrinth of narrow walks, low walls, crowded with numerous sweet smelling flowers, creepers and climbers, and memories of the past. Well cared for are some ancient Figs spreading their branches horizontally afar, and Peaches are a picture without framing or glazing, bearing freely and ripening too in the open, but the especial pride of the Colonel is a huge Benthamia fragifera near the mansion, so large that in describing it to my old friend "F. B." he said it was something else, but it is not, and unfortunately I had not taken the height and breadth thereof.

I must not omit to mention a charming spot I had passed in the morning near Ashford, situated in what appeared the fork of a river—Tritomas, Pampas plumes, Virginian Creeper, and all the glories of autumn seemed concentrated here. I learned afterwards it is the residence of Mr. Walpole, a gentleman noted for his love of hardy plants, and in no sweeter nook could he have gathered together his choice collection. The name of this place I do not know, but Eden or Paradise suggest themselves to a gardener's mind.

The climate of Wicklow is a favoured one, though the pleasant walk of six miles in the quiet September morning contrasted painfully with the lonely tramp back in the dark of night under weeping skies, and to wanderers in Wicklow a waterproof is indispensable. On another autumn day, which we gardeners seem to favour for a brief holiday, and enjoy the more when the hurry and rush of the season is over, the writer and another (the unbeliever in the huge Benthamia) set off at an early hour from the plains of Kildare on a special invite to see the gardens of Glenart Castle, the Irish seat of Lord Carysfort, situated on the right bank of the Ovoca, far down "that valley so sweet," and near the fishing town of Arklow. Detraining at Woodenbridge, we come to terms with a native car driver, who dashes us along some two miles of a good road to the entrance gates, where pride gets a fall from the guardian angel of the lodge, vigorously declaiming through the bars that one shall come in, the other shall not; to admit one, "them's her orders," but after some cajolings on our part, and protest on hers, we enter one of the best kept demesnes I have yet seen—a perfect road, with channelled sides, hard as a steam roller then in constant use on the estate could make it, winding round and up a hill to the garden entrance under a lofty clock tower. Terrace after terrace falls away to the south, and just beyond the handsome castle, surrounded by its velvet lawns, all in perfect keeping. The glass department is commodious, two houses of Pines were in grand form, as were also late Grapes— Gros Colman, huge in its berries, and of fine colour. A corkcovered door clothed with Ficus repens at the back of a central conservatory opening into the office was a novelty, the secret being a box on the inner side of the door through which the Ficus stem

was brought. Retracing our steps we climb the tower, where the keen sharp air brings forcibly to our mind that we had an early breakfast, and our worthy guide, Mr. Wilmett, trots us off to his creeper-clad cottage, where two hungry gardeners lighten the larder, and afterwards feast our eyes outside on the glowing mass of Ampelopsis Veitchi clothing the gardener's house and the outside of the garden walls.

On the left bank of the river, immediately opposite, is Shelton Abbey, the home of the Earl of Wicklow, laying low in the valley, distinct in its character from Glenart, but equally beautiful. The nearest bridge is miles away, and boating is not possible at any time. To-day water is scarce, at other times too plentiful, coming down with a rush from the mountains; but friend Wilmett, though not an energetic man, is equal to this emergency, and orders his heavy cart, in which, cushioned on straw, we navigate through broad shoals of gravel, and catch Mr. Tyler at home, from which I think Irish gardeners are seldom absent. Huge Bay Laurels and many shrubs, but semi-hardy in less favoured localities, flourish here. All looks well in the houses. Again more Pines, but little inferior to those of Glenart; but a limited staff of hands cannot result in the high keeping which obtains across the river. Another noted place a few miles from here is Coollattin Park, the seat of Earl Fitzwilliam, as yet to me a terra incognita.

Nearer to Dublin is the ruins of the seven churches in the

Nearer to Dublin is the ruins of the seven churches in the valley of Glendalough, and nearer still to the busy hum of the great city is the Scalp, a gigantic freak of Nature in rockwork building, huge boulders of many tons weight piled high up on each side of the high road. The Scalp being but some nine miles by road from Dublin is a popular resort of those on pleasure bent, and sundry remains in the shape of bottles bearing the name of Guiness or Jamieson give silent evidence of modern Celts patronising Irish manufacture; but among the mountains of Wicklow, the lover of Nature can, undisturbed, hold communion with her visible forms, and easier understand how strong is that feeling of amor patriæ in the breast of the poor emigrant, so many of whom go to seek their fortunes in the great land of the West, and so few of whom return to see again the loved hills and

valleys of dear Ireland.

Sparsely populated, each census telling the tale of decreasing numbers, the few one meets with are quiet and thoughtful looking, greeting the stranger in soft and pleasing accents, so different to the awful brogue some English papers are pleased to give us specimens of. Warm-hearted, generous to a fault. Some years since the rector of the parish I was then situated in was lending a sympathetic ear to my tale of difficulties—I, a newly imported gardener, experienced with a large staff of workmen; but years have rolled by, and hours of trial have come that few escape, and I have experienced that generous warm-hearted sympathy ungrudgingly given to me, an alien in race and creed, that I can now endorse the remark he then concluded with—" with all their faults I love them still." I venture to touch but lightly on a subject which may at first sight appear out of place in the Journal. on consideration, it cannot be an unimportant one to the English gardener settled in Ireland; and to those who are not, it may serve to remove one at least of many erroneous impressions that time and experience have eliminated from the mind of-E. K.

ORCHIDS FOR FLOWERING AT CHRISTMAS. (Continued from page 464.)

A SELECTION of Orchids for flowering at Christmas would be incomplete without that easily managed and useful species Cypripedium insigne, which, with its varieties, can be depended upon, with greater certainty and less trouble than any other, to produce its flowers in December, and retain them in good condition into January, or later if desired. As a matter of experiment we have grown this Cypripedium in many different soils and under varying conditions, and though it has not been always equally satisfactory, it has never absolutely failed. If potted soon after flowering in a compost of equal parts fibrous loam and peat, with the addition of a small proportion of old decomposed cow or horse manure, it has a long season of growth, a vinery being a capital place for it, supplying water and syringing freely in warm weather. At the present time a conservatory, warm greenhouse, or the cool end of an Orchid house is suitable—in fact, any position where it can be

protected from draughts of cold air, and where the temperature does not fall below 45°, diminishing the application of water as the flowers show, but giving enough to prevent their suffering or being checked. When in flower plants can be placed in a room, or the flowers if cut and arranged in vessels of water will last for weeks. The varieties are now numerous, ranging from a pale yellow or nearly white tint to a rich polish bronzy brown, with purple or violet spots, or tinting in dorsal sepal, which also varies in size and in the breadth of the white margin. One of the best still is, however, C. insigne Maulei.

For richness of colouring and gracefulness of habit Lælia anceps and its charming varieties are unsurpassed for winter, and their flowers can be as readily ensured at Christmas as the old Cypripedium just named. They can be grown in a warm conservatory or in the warm end of a cool Orchid house, but from now until the flowers are fully expanded they are better in rather dry quarters, as the presence of much moisture in the air is apt to injure the flowers. Only sufficient water is required to keep them fresh and prevent the plants suffering, and it may be taken as a general rule for Orchids in flower during winter that the smallest quantity of water with which they can be supplied consistent with the health of the plants is the most likely to ensure the long lasting of the flowers. The ordinary varieties of L. anceps, with rosy purple sepals and petals and rich crimson lip, are all beautiful and useful for general cultivation, but there are scores of other forms differing greatly in richness or delicacy of colouring, some, as Barkeriana and Dawsoni, possessing strongly marked characters.

A most useful winter Orchid is Zygopetalum Mackayi, which produces its purple-veined flowers naturally in the dull season, and the plants being managed without any great difficulty it is deservedly a favourite. It makes its growth best in an intermediate house, a warm conservatory, or the coolest part of a stove. When in flower it is preferably, however, transferred to drier quarters like most of the others mentioned. The well-known Dendrobium nobile can be added to the list, for if the plants have been duly prepared it is easy to have some in flower at the middle or end of December. D. Wardianum can also be occasionally had in flower at the same time, but both must have been thoroughly matured in a sunny warm position, and be bought on very gradually. D. nobile is especially valuable, as its flowers are useful for cutting to be employed in buttonholes or bouquets. Vanda cœrulea will help materially if it can be secured, and its pale blue flowers can easily be had if the plants are arranged in a cool house and carefully watered during the present and the next month. The small flowered but fragrant Vanda Amesiana is another charming Orchid for this season, its white rose and purple-tinted flowers being much appreciated. Like the last, it is best in a cooler position while flowering. The diverse-flowered Dendrobium Phalænopsis var. Schræderianum is in excellent condition during November and part of December, some plants frequently continuing attractive over Christmas. An intermediate temperature suits very well, but it can be arranged with any of those named in a warm conservatory. The true autumn-flowering Cattleya labiata may be grown under similar conditions, and its flowers prolonged into January. This, and its varieties under whatever names they are grown are most valuable for the Christmas list.—Orchidist.

(To be continued.)

THE PREMATURE DECAY OF APPLES.

I was much interested in reading Mr. Iggulden's letter on page 437, November 16th, and, like him, should be glad to have a satisfactory explanation of the premature deeay of our early Apples this season. Every agriculturist knows full well that when Turnips have been checked in their growth by hot dry weather, and their skin has become "hide bound," they will after a soaking rain, start to grow again, and the skin being tough will frequently crack at the shoulder, the Turnip putting out fresh tops at the neck, and subsequently keeping very badly. This would seem to support Mr. Iggulden's theory that the late rains, which came before the fruit was ripened, coming after the long dry spell, had by causing the fruit to swell rapidly occasioned the mischief complained of; but this theory is difficult to maintain in the face of the fact that the same varieties when grown in pots under glass, and had never suffered from lack of food or moisture, spotted and eracked quite as badly as their fellows in the open air. Many of the best fruits after being carefully gathered and stored swelled and cracked like a baked Apple, Ecklinville, Alexander, Lord Suffield, Lord Grosvenor, and New Hawthornden, were amongst the worst offenders, whilst Cox's Pomona, a variety which I think much under-rated, Domino and Bismarek have stood the trial better.

Of the American varieties I cannot say much, as they are unsuited for our climate in the Midlands. Newtown Pippin we discarded year

ago, as the fruit was little larger than Crabs, and most of the Americans seem too tender for us; King of Tomkins County is an exception

perhaps, but has proved so far a shy bearer.

Of the later kinds we have not much to complain, and although they ripened early they seem to be keeping well; with such varieties as Newton Wonder, New Northern Greening, Alfriston, Beauty of Kent, and Bramley's Seedling as sheet anchors, there should be no dearth of late cooking Apples; whilst King of the Pippins, Cox's Orange and Scarlet Nonpareil are keeping very well so far. Cornish Aromatic has done well this season, and Sturmer Pippin seems to be in great force; everyone has a crop.

Approve of prices I was grieved to bear of Cornish. everyone has a crop. Apropos of prices I was grieved to hear of Cox's Orange being sold in Somersetshire at 6d. a peck; when I was at the Market Growers' Show in Maidstone last month I saw a two peck basket of this variety sold for 20s., these must surely be extremes.

The conclusion that we came to here was that the cause of our fruit keeping badly was the heat of the fruit room, which, although built with hollow walls, is exposed to the full sun, and it seemed beyond our power to keep it cool. I saw on my visit to Kent a fruit room thatched with reeds on the roof and sides, which contained a collection of fruit calculated to arouse the envy of any grower; doubtless the owner will

tell us how it has kept .- A. H. PEARSON, Chilwell, Notts.

MR. IGGULDEN (page 437) has done well to draw attention to a not improbable scarcity of Apples in several places later in the season. The past summer produced splendid crops with me, and so far as I can foresee the supply here will last till June. The Apple crop of 1892, especially late kinds, was fairly good; those in use from January onwards were the following: Kirke's Incomparable, an old free bearing gott. Northern Groning Lander Pinnin Manage Political onwards were the following: Kirke's Incomparable, an old free bearing sort; Northern Greening, Leyden Pippin, Mère de Ménage, Bedfordshire Foundling, Norfolk Beefing, Striped Beefing, and Baldwin. Norfolk Beefing was the last for use in May, when the Gooseberries came in. Of dessert kinds, King of Pippins, Adams' Pearmain, and Old Nonpareil kept well till late in the spring. The Baldwin Apple in March, April, and May is good for either culinary or dessert, the reddest and best

looking being picked out for the latter purpose.

As regards the supply for next spring, which with myself I am glad to say is more plentiful than last year, the following kinds may be named, none of them may perhaps be termed large showy Apples like some of the autumn varieties, still they are worth cultivating. the largest are Mère de Ménage, Alfriston, and Striped Beefing. last named is an excellent cropper, a pruned bush of it 7 feet high and as much through produced three bushels of large Apples, many of which are more than a foot round. One of the most abundant croppers, and moreover of best cooking quality, is the old Northern Greening. There are a number of orchard trees in this neighbourhood, possibly planted by our great-grandfathers, that were crowded with fruit. From an old standard in this garden seven bushels were picked, and then a large number were left on through not being easy to reach. Although so old a sort, where one is wanted for culinary purposes in the new year this may well be planted. If the new Northern Greening is as good a cropper it will be an acquisition to our modern kinds. Neither should Norfolk Beefing and the Striped Beefing be omitted, the last named I find is the largest and most constant cropper, taking one season with another. As regards the black and brown spots so much observed this year, I have noticed it with several kinds, and particularly the Ribston Pippin. My impression is that it was caused by a severe hailstorm that occurred here about the end of June. The weather was very hot at the time; but it was a singular sight to see all the fields with an half inch covering of hail. It was a curious spectacle, a midwinter scene in mid-summer; but in half an hour it had all disappeared, and the afternoon being hot and sultry.

I see by Mr. Iggulden's article that he would like some information as regards American varieties of Apples doing well in this country. Out of nearly fifty kinds grown here, there is only one that I know of that is American, and that is the Baldwin. Of its fruiting and good keeping qualities I cannot speak too highly. keeping qualities I cannot speak too highly. As I said before, it is good either for kitchen or table purposes from March to May or June; whether it will keep this season so long is a matter I can only speak of later on, when the time comes. Seventeen years ago two dwarf bushes were planted here, and being a vigorous kind grew freely. The soil I may state is a stiffish loam about 3 feet deep resting on gravel. After three or four years they commenced bearing, and have done so ever since, some years more than others. The best of the two bushes is now 8 feet high, and as much through; in fact, they have been kept pruned to that height the last ten years. Pruning, if possible, is usually performed in August; it admits the light in to help colour the fruit, and is beneficial for the next season's buds. But it is not only as a pruned oush that it can be recommended, for it is as an unpruned tree that it has done so well. Eleven years ago I was induced to insert grafts of it in an old apparently worn out tree of Wellington, through an odd circumstance. It so happened that a bed of Parsley was growing beneath the pruned bushes of Baldwia, and in March of that year (1882) three Apples were found beneath the Parsley leaves in a perfectly sound condition, having passed through the winter's rain, frost, and snow uninjured. evidently fell and lay unnoticed or hidden since the previous October. I cut one of them, and although it was not quite ripe the flavour was very good, and the thought occurred to me that it was an Apple worth looking after. Eight grafts were placed on the sawn-off Wellington; four of them grew well, and now form the head of a tree nearly 30 feet high. The largest of the grafts at the present time measures 23 inches round. The circumference of the main stem or stock at 6 inches from

the ground is 5 feet 6 inches. The first year after grafting, the young shoots, some of them a yard in length, were shortened about one-half. Since then no pruning has been done. The crop from it this year has been three-and-a-half barrels of 10 stones each barrel. Last year about a bushel was produced, and in 1891 two barrels, or about six bushels. So much for its vigour and fruitfulness. The shelves in the fruit-room being all occupied with other kinds, and as our American friends put them in barrels for several weeks, or may be months, I thought I would do the same, and stand them on the brick floor of the fruit-room. In 1891 they were taken out of the barrels three months after picking in a perfectly sound condition, not half a peck being bad. The other day, two months since they were picked, having now more room on the shelves, about 20 stones were taken off the top of the barrels, and out of that quantity only twelve bad Apples were found.

From the two pruned bushes and the grafted tree between 50 and

60 stones of fruit of good size have been picked this year. In September last year I examined the branches when in full leaf, and could see that it was likely to have a large crop of blossom, so two barrowfuls of dry wood ashes and four of good manure were placed over the roots of the grafted tree, a covering of about 4 inches deep, and left for the autumn and winter rains to wash in. No doubt this dressing left its

mark on the excellent weight of the crop. Another point in favour of this Apple is this: It has been my lot on many occasions a few years back to buy and unpack barrels of American and Canadian Apples—Newtown Pippin, Baldwin, and Northern Spy, and as a general rule I found that the Baldwin always came out less damaged than either of the others. Although both of them are excellent sorts, yet the skin appears thin and liable to injury. Many times I have emptied a Baldwin barrel, and only a dozen Apples or so have been damaged, whereas of the other two kinds a bushel has often been unfit for use. Fruit from the north side and shaded parts of the trees are green, but those fully exposed to sunshine are a bright red. I have rather enlarged upon this much-imported Apple; but as it has done so well it is a pleasure to recommend it to others. It certainly is not so ripe here in January as those sent from America at that time. It would be of interest to know how it has fared with others who have cultivated it for any

length of time.—A. HARDING, Orton Hall, Peterborough.

In common with others I have found Apples to keep very badly this season. Ribston Pippin and Blenheim Orange have been the worst offenders with me. It is really sad to see such fine specimens going so fast. The late Apples, Lane's Prince Albert, Alfriston, and Wellington, are not so bad at present; but every inspection shows a few more decayed fruit. Beauty of Kent and the Pearmains have done very well with me

at present, and so have both the Hawthordens.

What "A. D." (page 465) says on the preservative power of dead leaves is, I believe, as true as it is interesting. They are Nature's own covering; not only her bed clothes for the winter sleep of her tender plants, but also her means for the conservation of her produce and fruits for her creatures who are meant to eat them. I have found them the

best of the many materials I have tried for the protection of the dwarf Tea Roses against severe frost.—W. R. RAILLEM.

1 HAVE heard numerous complaints of Apples keeping badly, but the state of matters indicated by Mr. Iggulden at page 437 is more serious than I had imagined. Personally, I cannot say much about the earlier Apples, as I sold all when they were ready. Late kinds are keeping quite as well as usual. A few fruits keep decaying, but these without exception have been pecked or otherwise damaged. While that is the exception have been pecked or otherwise damaged. While that is the case here, I hear of others who have lost most of their best fruit. But I know that this had been gathered much too soon.

The autumn was perfect, and many gardeners seem to have been tempted by the appearance of the fruit to pick it much earlier than usual, some crops having been gathered and stored before the end of September. Then, the practice of keeping Apple rooms shut close is, I am certain, prejudicial to the keeping qualities of the fruit. Judging by the manner fruit left out of doors keeps, it is apparent that free ventilation is not inimical to the fruit. I keep our Apple store freely ventilated, except in frosty and damp weather, and believe it to be

beneficial.

With regard to the fruit of Duchess of Oldenburg decaying it is quite a common occurrence for it to do so. It is the only fault I have against this beautiful variety. The decay begins at the core and spreads outwards.-B.

FROM the reports of your various correspondents it is evident that the price of Apples must eventually go up when there comes a scarcity of home-grown produce. I find that Emperor Alexander, Warner's King, Peasgood's Nonesuch, and Wellington are showing signs of deterioration, whereas Bramley's Seedling, Manks Codlin, and Lane's Prince Albert are in the best of condition. I have them stored in an airy room, which is not over-dry, and which I can ventilate by a window 18 inches square.

As to the cause of this rapid decay I agree with Mr. Cheal (page 466) that it is the sudden and superabundant flow of sap through the trees after the fruits have begun to ripen that has ruptured the cellular tissues which connect the fruit to the tree, and which we are told by scientists become gradually sealed up as the Apples develop, so that when the fruit is beginning to ripen there is really no connection for the flow of sap. This would greatly interfere with the ripening process, which has evidently been the case this year. Perhaps it would be of service to your readers if our large growers of fruit would state the kind of soil upon which their trees are grown, and also whether the fruits produced upon dry soil are keeping better than those grown upon that of a heavy wet nature.—S. H.

A GOOD CROP.

CAN you oblige me by giving the name of the Apple, of which I send you sample herewith? A tree from which they were gathered is growing in the garden of a neighbour of mine. It is an old standard of considerable spread of growth, and always bears well; but this year it has excelled itself in the production of over 19 cwt of fair sound fruit. Many of them are much larger than those sent, and they keep well until April and May, and cook splendidly. I trust this note may be of interest to you, and shall be glad to know if instances of single trees yielding a ton of fruit in a season are at all frequent.—JNO. BATEMAN, Highgate, N.

[The Apple closely resembles Rymer, a useful culinary variety. Nearly a ton of sound fruit, such as the samples sent, from one tree is a remarkable crop of a good orchard Apple.]

APPLES LOSING FLAVOUR.

ALTHOUGH much has been written on the best means of preserving Apples I have not recently observed anything upon the absorbing powers of materials employed in the packing of Apples. Lately I was cutting up a number of barrels in which Apples had been imported, the wood being of red and white pine. Some of these barrels had been exposed a long time to the influence of the weather. Yet the fragrance of the Apples was very pronounced, being greatest in the red pine, and the Apples in the barrels must have lost much of their flavour after they were gathered.

My reply to "A. D.'s" query (page 465), "Has anyone ever tried the stacking of Apples in leaves outdoors?" is that I have frequently come across Apples buried amongst leaves by boys or animals, quite fresh in spring, as were isolated ones beneath the natural fallen leaves, when Apples from the same trees, stored inside were not in the same sound condition. The hedgehog has sometimes collected heaps of Apples, and this autumn I found a large number of Pears in a heap beneath some Ferns, the animal perhaps instinctively knowing the decaying fronds would afford ample protection.—T.

PRIMULA FORBESI.

At the meeting of the Royal Horticultural Society on Tuesday, November 14th, much interest was centred on a basket of plants of Primula Forbesi, staged by Sir Trevor Lawrence, Bart., Burford Lodge, Dorking. The plants were covered with small lilac flowers, having yellow centres, the whole forming a pretty mass of bloom. P. Forbesi is a native of Yunnan, China, and was introduced in 1891, but apparently it is not yet included in other than choice collections. It may be termed a half-hardy species, thriving best in a greenhouse or frame, under the same conditions as P. obconica, and it usually flowers in November. The illustration (fig. 70), which indicates the character of this charming Primula, has been prepared from a sketch of the plants exhibited on the above occasion, and for which a first-class certificate was awarded. It is stated to be a biennial plant, and can be readily raised from seed.

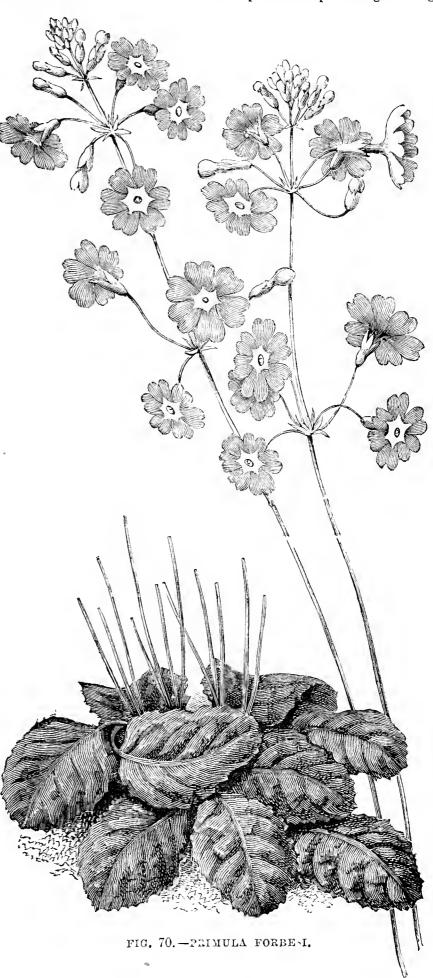

NOTES BY THE WAY.

A GREAT VEGETABLE GROWER AND HIS WORK.

In a series of retrospective reflections it is impossible to avoid depressing contrasts. Winter thoughts or summer wanderings bring back many a pleasant scene. A beautiful spot is recalled in some country garden, and at once eyes are filled with summer sunshine and ears with the song of birds, for with the one recollection comes back a host of others closely associated with it. But a nor' easter whistles around the windows, showers of sleet are driven against the panes, and bare soil instead of flowers rewards the outward glance. It is natural that the æsthetic soul should indulge in a sympathetic shiver and retire within itself, indulging in a kind of dormouse existence until the spring comes again. The contrast is too great to be realised without a sense of emptiness and depression, and so it is shrunk from and avoided.

Gardeners as a body are by no means devoid of sensibility, or dead to every artistic influence, but for all that they do not usually share to any great extent in the feeling to which reference has just been made. The explanation, of course is, that although floral aspects play a part in a gardener's work, and have no small share in his happiness, they do not fill his life. There are trees, for example, and these, as a writer has has said, are "silent friends, remaining with us always." A collection of fine Conifers, such as those referred to in my notes on page 464, is a source of perennial pleasure. They have not the charms when bending under ripping winds, and dripping with cold rain, that they possess in the spring time, but they are there, solid and visible, affording subject for admiration, conversation and discussion. Truly trees are friends, and if they are silent ones then all the more reason why we should blow their trumpet for them.

And, again, if the flower beds and borders are empty the kitchen garden is not. The most advanced eathetic must eat, and surely there is much food for interest in comments and observations on vegetables. It is sheer affectation and pedantry to look down upon a Cabbage or a Parsnip just because it ministers to our physical wants instead of to our artistic ones. Let us be sensible and study both, then when the flowers have gone we can find consolation in the more practical aspects of gardening.

Probably there are not many cultivators who will deny that there is as much interest, if not as much beauty, in a well stocked and well managed kitchen garden as there is in a series of flower beds. There is a variety of method and varying degrees of skill in the one just as there is in the other. In one garden a particular crop or variety does better than in another, and in one instance there is a good system of cropping and great productiveness, while in a second the plan of action is imperfect and the crops moderate or poor.

Great vegetable growers are as much entitled to respect from the fraternity generally as, let us say, great Chrysanthemum growers, and their methods are as well worthy of study. They do not always get it so far as the general public are concerned, for what casual visitor at a

show will pause to discuss and admire a Dell's Beet when there is a Viviand Morel not far away? But in the inner circles the leading kitchen gardens of the country do not pass unthought of, and for that reason I think it probable that a few remarks on one of the best-known cultivators and his work may have at least a vestige of interest. What gardener reading the reports of the principal vegetable competitions does not know the name of Mr. C. J. Waite? He is not a triton amongst the minnows, swooping down on small shows and bringing confusion to minor cultivators, but one who loves to meet foemen worthy of his steel. This is the sort of fighter that Britons respect most. The warrior who shirks from contests with others of his own calibre in order to have easy victories against opponents a long way below him is a poor sort of creature. Better be beaten by a good man than earn a creditless victory against one of a minor grade.

Glenhurst lies somewhat off the main road from London in a quiet, retired corner of the pleasant Surrey townlet of Esher, but it is within comfortable walking distance of the station of that name. It is not what would be called a large place as that term is usually understood amongst the craft. The kitchen garden, which is in more than one part, mounts up to about $2\frac{3}{4}$ acres in all, which means a fair but not great extent of ground. And the pleasure part is about in proportion, also the glass. This does not point to extraordinary provision for securing exceptional crops, and as a matter of fact a visit shows at once that the exceptionally good results secured are the result of the best cultural methods combined with incessant work. A man of wonderful energy is Mr. Waite. He is a worker to the finger tips, getting through as much as two ordinary men. Active and alert, brisk in every movement, he is a thoroughly good type of the English gardener. Should anyone think that the place is purely a "show" one, where everthing is sacrificed to securing fine samples for exhibition, he should go and let his own eyes teach him a lesson of the error he has made. The amount of produce which is grown in the Glenhurst gardens will, I venture to think, set all such hasty criticism at naught.

My call was paid in the height of the hot summer weather, and I found the presiding genius of the garden hard at work with the foreman—another of the go-ahead brigade—pouring sewage on to a Vine border. The dark, rich-looking liquid was being applied in scores of gallons, and the Vines seemed to appreciate it, for they were in splendid health and carrying fine crops. The wood is too strong to be tied till it comes down with the weight of the bunches. Foster's Seedling, Muscat of Alexandria, Black Hamburgh, Mrs. Pearson, Buckland Sweetwater, Black Alicante and Lady Downe's were all finely represented, being particularly noteworthy for size of berry.

That the Glenhurst gardener is an admirable fruit as well as vegctable grower, the Peaches and Nectarines also serve to prove. The collection in pots was particularly striking, quite reminding one of Mr. Rivers' wonderful trees. Pine Apple had given 158 fruits, and a bush of Princess of Wales was almost breaking down with its burden. Two other sorts, which give excellent crops are Bellegarde and Crimson Galande. To summarise, seven trees had given 700 fruits, and when it is borne in mind that bushes in pots have produced this result, it will be accepted as highly creditable. The trees are repotted every year, and plunged in leaves out of doors when at rest. Beyond shortening a few leading shoots of a straggling character little pruning is done. The trees bear most of their fruit on short natural spurs. Trained Peaches planted out under glass were equally fine in their way.

Yet another excellent fruit crop was Melons. Few such crops are met with in gardens as that which Mr. Waite had to show. The plants had been planted in a span-roofed pit, which had been used for propagating in the spring. It has six lights, and eighteen plants were put in 14 inches apart. On these 100 fruits were set and swelling, presenting a tempting picture. The plants were in the best of health, and evenly trained, not a tangled mass of interlacing growths. Mr. Waite is no believer in keeping a dry atmosphere at ripening time, and does not practise the system. The special favourite is one he raised himself, called Perfection, and which Messrs. Sutton are, I believe, sending out. It is a Melon uniting delicious flavour with other good qualities.

One of the secrets of the Esher exhibitor's wonderful series of successes with vegetables is deep cultivation. When he started operations he found a thin, half-worked soil, and he set to work to trench, doing a good deal of the work with his own hands. In the original garden there is now a depth of about 3 feet of pulverised, aërated, crumbly soil, well sweetened by the air and enriched with more solid substances. This deep root medium results in magnificent crops, particularly of roots. Take Parsnips for instance. At a time when most people's crops were half a failure from the drought Mr. Waite could draw and show me a clean, straight, whip-like root nearly 18 inches long, and which would have developed into a grand example in due course. This grower sets himself up ideals in vegetables as others do in flowers, and one of his great feats is to produce Parsnips which, root and top growth included, are as tall as himself. This is not bad work. Native guano helps him. He uses six or seven tons of this useful fertiliser every season.

But it is not Parsnips alone. Carrots were a picture for such a season, not looking parched and miserable, but healthy laxuriant and flourishing. Onions are another speciality. Early sowing supplemented by deep

rich soil give the 2½ lb. bulbs which add so materially to the strength of the Glenhurst collections. Some Mammoth Silverskins were 18 inches in circumference. These were striking individually, and as a crop it would be difficult to imagine anything finer than a large piece of autumn sown in the new kitchen garden. Celery, too, is splendidly grown. The early crop is taken off the outside Vine border, and Mr. Waite argues that the Vines benefit rather than suffer by the system, inasmuch as they get the advantage of the manurial applications given to the Celery. The sticks are blanched with brown paper. The later crops are grown in the new gardens, and such crops are rarely met with.

Lettuces and Leeks are also blanched with paper. An early crop of the former is taken, and then the ground is planted with Cauliflowers. To refer to the merits of every crop would be merely a repetition of adjectives, for there was no exception to the rule of fine produce and full land. Even Peas, so bad in most gardens, were good, Magnum Bonum in particular being full of excellent pods. Potatoes come out large, shapely and clean, because the land is worked until it is as friable as so much potting soil, crumbling soft as silk beneath the fingers.

Few cultivators work their land as hard as Mr. Waite. He has much to provide, besides what is wanted for the exhibition table, and he packs the ground with grand produce. But consider how his soil has been studied! He enlarged the plant larder until its capacity was increased threefold, and then stored it with good things. Alike in its mechanical condition and in its fertility has been improved year by year until it is like a mass of potting compost, rich, porous and friable. He has made corresponding provision for his vegetables to that which a Chrysanthemum champion makes for his plants when potting. The work is a monument to his industry and an example to all who aspire to be what all must admit him to be—a credit to British gardening.—W. P. W.

EVENTS OF THE WEEK.—But few events of horticultural interest will take place in the metropolis during the ensuing week. An Exhibition will be held, under the auspices of the National Chrysanthemum Society, at the Royal Aquarium on December 5th, 6th, and 7th. The annual meeting of the National Rose Society will be held at the Hotel Windsor, Victoria Street, S.W., on the 7th prox., when the Rev. W. Wilks will occupy the chair. The members of the Society will hold their annual dinner during the evening of the day mentioned, and at the same place. A few auction sales will be held, as usual, at the various rooms, the particulars of which will be found in the advertisement pages.

- THE WEATHER IN LONDON.—The past week has been characterised by some changeable weather. On Sunday it rained more or less for the greater part of the day in the metropolis, but cleared at night, and a severe frost occurred early on Monday morning. Towards evening on the latter day it became mild, similar weather continuing on Tuesday. Wednesday opened dull but fine, and at the time of going to press it is very mild for the time of year.
- WEATHER IN THE NORTH.—There were slight frosts for a morning or two at the beginning of the past week, but the weather has generally been open and unsettled, with an occasional wet evening. On the morning of the 27th 4° frost were recorded, and this morning (28th) the thermometer registered 52°.—B. D., S. Perthshire.
- ROYAL GARDENERS' ORPHAN FUND. An entertainment, under the patronage of Lord Egerton of Tatton, Coningsby Disraeli, Esq., M.P., J. W. Sidebottom, Esq., M.P., and other distinguished persons, will be held in the Literary Institute, Altrincham, on Wednesday evening, December 6th. Mr. William Plant, the active Secretary of the Local Committee, hopes that the present effort to strengthen the Fund will be even more successful than a previous one, when £20 were realised.
- A MEETING of the Committee of the ROYAL GARDENERS' ORPHAN FUND was held on Friday last at the Hotel Windsor, Westminster, W. Marshall, Esq., presiding. The receipts for the month were considered satisfactory, one amount of £21, the proceeds from a concert organised by W. Furze, Esq., Mr. A. Dean, and others, for which a special vote of thanks was accorded. Various other amounts had been received from the sale of flowers at Chrysanthemum Shows, collecting cards and boxes, and from Ketton Hall Gardens, Stamford,

and The Grange Gardens, Wallington, where Chrysanthemums had been on public view. It was decided to elect five more orphans at the annual meeting. Forms of application can be obtained of Mr. A. F. Barron, Hon. Sec., Royal Horticultural Gardens, Chiswick, and must be returned on or before December 27th, 1893.

- DEATH OF ALEXANDER STEPHEN WILSON.—With regret we announce the death of Mr. A. S. Wilson of North Kinmundy, Aberdeenshire, which took place in Aberdeen on the 16th inst. Mr. Wilson, who was in the sixty-seventh year of his age, took a great interest in botany and agriculture, and was the author of several scientific and philosophical works.
- DEATH OF MR. BAILEY DENTON.—We regret to hear of the death of Mr. J. Bailey Denton, which took place on Sunday, 19th inst. Mr. Denton was in his eightieth year, and for a long time had made agriculture his hobby. Of late years Mr. Denton took much interest in the cultivation of Orchids at his country residence at Stevenage in Hertfordshire.
- NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL ASSOCIATION.—The members of this Association held their monthly meeting at Aberdeen on Wednesday, 15th inst. There was a good attendance, and Mr. John Munro, Polmuir Nurseries, occupied the chair. An Exhibition of flowers, fruit, and vegetables was held. Cultural certificates were awarded to Mr. J. Crighton and Mr. Ross, Cranford, for Chrysanthemums and Orchids.
- THE AGRICULTURAL EXHIBIT of Sir John Lawes and Sir Henry Gilbert at Chicago appears to have been much appreciated by the Americans. According to "Nature," the Association of American Agricultural Colleges and Experiment Stations have passed a special resolution expressing the value they attach to the exhibit, and the Director-General of the Exposition has forwarded the same to England, with the added thanks of the Exposition, for "the great benefit done to American agriculture by this excellent and instructive exhibit."
- A WILD FLOWER CARNIVAL.—An Australian paper gives an account of a "wild flower carnival" which the residents of York made an absolute success. From its inception the idea of a wild flower show in "the garden of the colony" "caught on," and a keen amount of friendly rivalry was shown, which resulted in a display which, for uniqueness of arrangement and variety of design, made the task of judging the various exhibits a difficult one. On entering the hall, it is stated, one was first impressed with the artistic taste displayed in the various decorations, and the care and attention which was shown in the arrangement of the exhibits, so that everything should be seen to the best advantage, and for this the ladies, who are always willing workers on such occasions, deserve the warmest thanks.
- BRUSSELS SPROUTS.—It is exceedingly instructive to find that whilst a good deal of complaint has been made as to the unsatisfactory products of Brussels Sprouts in many private gardens, they are so good in fields where grown on harder soil, and are more exposed to the weather. It would be well if some gardeners who complain so much of the coarse and inferior sprouts their plants produce from their rich loose soils, would dibble out plants on to hard soil early in June, such as had carried during the winter a crop of Spinach, or some other winter produce, other, of course, than Brassica. To give full effect to the virtues of firmness the soil should not be dug, only deeply hoed over, then the Brussels plants put out and left to take their chance. That is the way to induce the production of very hard woody stems and firm well-formed sprouts. Especially are such plants valuable for late winter cropping.—D.
- White Earwigs.—Our old friend "Lanarkshire Bee-keeper" (page 458) asks what are they? and as no one has replied, perhaps I can throw a little light on the subject. I have frequently met with specimens in various stages of growth, and my impression is that they have very recently cast the brown skin or moulted, and that in a few days at most they regain their usual brown colour. I have no doubt that "L. B. K." has frequently found the sloughs under quilts on bee hives. Respecting earwigs being "more the friends of the gardener than his enemy," I expect it will take a vast amount of ocular demonstration to persuade some of us to entertain the idea after our experience in Dahlia, Rose, and fruit growing, not to mention smaller matters, whatever may be their counteracting uses to bee-keepers, which I have yet to learn from observation. I once killed about 2750 earwigs at one round of my garden and orchard, and I certainly have no wish to renew the stock.—J. HIAM.

- —— CANKER IN FRUIT TREES—I see (page 467) that Mr. J. Hiam is satisfied he "can cure canker by dressings of insecticides and lime." Will he explain his methods? also how he induces his men to apply the lime?—B. D. K.
- PROFESSOR MARSHALL WARD.—We learn that a Royal medal has been awarded by the President and Council of the Royal Society to Professor Marshall Ward in recognition of the merit of his researches into the life history of fungi.
- —— DEATH OF MR. ROBERT FRASER.—We regret to learn of the death, which took place recently, at the age of seventy-one years, of Mr. Robert Fraser, senior partner in the firm of Messrs. Cunningham, Fraser, & Co., nurserymen, Comely Bank, Edinburgh.
- ALLOTMENT GARDENS IN BUSHY PARK.—A letter was read at a recent meeting of the Hampton Wick Local Board stating that the Chief Commissioner of Works was willing, subject to the sanction of the Treasury, to grant the Board 14 acres of land in Bushy Park for allotment gardens at a rental of 70s. per acre per annum.
- MR. SWAILES in your issue of the 23rd inst. (page 467), speaks of STEPHANOTIS FRUITING. I had two fine fruits on a plant two years ago, one I cut off, and the other I saved; in due course the fruit ripened, and the seed sown from which I have fine young plants.—ARTHUR SHAMBROOK, Gardener, Sutton Hall, Derby.
- DEATH OF MR. DUNCAN WALSH.—On November 19th, Mr. Duncan Walsh, for thirty-four years head gardener to the Earl of Pembroke, Mount Merrion, near Dublin, passed away at the age of sixty-four. Retiring from active life but last June, he returned to his native county, Ayrshire. His many friends will learn with regret that he has not been longer spared to enjoy his well-earned rest. Though not an exhibitor, he for many years assisted in judging at the shows of the Royal Horticultural Society of Ireland. As a plant grower his name is associated with the finest specimen of Darlingtonia californica ever grown, and as a man he was esteemed by all who were privileged to know him.
- EDINBURGH BOTANICAL SOCIETY.—At a recent meeting of this Society, Dr. Christison in the chair, it was arranged that Mr-R. Lindsay of the Botanic Gardens should submit an obituary notice of the late Mr. Jenner at the next meeting. Professor Bayley Balfour intimated that Mr. George William Trail had presented his valuable collection of British Algæ, and a series of microscopic sections of the same, to the Society; also that Dr. Watt had given the Society a herbarium of Indian plants, both donors stipulating that the collections be kept intact during their lifetime. The Rev. Mr. Paul gave a report of the Scottish Alpine Botanical Club's excursion to Clova, and Mr. Lindsay reported on the weather for October. Professor Bower was elected President of the Society for the current year.
- —At the monthly meeting of this Society a few days ago, Mr. Mark Longhurst, the Secretary, gave some figures bearing on the success of the recent Chrysanthemum Show in that town. On the first day, he said, 3019 people paid for admission, and 5560 on the second day. The takings at the doors amounted to £76 8s. the first afternoon, £78 17s. the first evening, £77 17s. 6d. the second afternoon, and £102 4s. 6d. the second evening. Up to the present time, apart from the ticket money, their receipts throughout the year come to £1047, and probably, when everything was settled up, their total takings for the year will be found to be about £1060, and their expenses under £1000. The expenses of the Spring Show were £233, and of the late Autumn Show £418 5s., so that they had already paid out £656.
- Onions and the Maggot.—Having regard to the absolute freedom from the maggot of Onion plants raised from autumn sowings, it seems a pity that it was not the rule, more than it now is, to sow in the autumn some of the best keeping varieties rather than White Lisbon, Rocca, and Tripolis. The ordinary spring-sown varieties are just as hardy, and certainly would keep very much longer. Such varieties as Cocoa-nut, Sutton's Globe, Southport Red, and Crimson Globe, all the best of keepers, would prove of great value if grown from autumn sowings. The Tripoli types are mature to-day, useless to-morrow whilst the sorts I have named will keep till Christmas. A sowing made early in April under glass would give strong plants to go out at the end of May, and these would escape the maggot also. How easy then is it to circumvent this pest which has done so much harm in our Onion breadths. Surely these little experiments are well worth trying.—D.

CEDRELA AUSTRALIS.—The most valuable tree produced in New South Wales is the so-called Red Cedar, Cedrela australis, which owes its common name to the sweet smell of its wood. It is much lighter in weight than mahogany, although it bears considerable resemblance to that wood and is used for the same purposes, that is, for cabinet work and furniture in general, and for the fittings of buildings, where the cost is not too great. Where it is kept dry it is, says a colonial contemporary, very durable. Naturally of a pleasing red, it turns to a deeper and richer colour with age, and some trees have a beautiful grain. It is stated that extensive plantations of young Cedar are being made every year and are flourishing finely.

DEATH OF MR. ISAAC DIXON. — We regret to learn of the death and burial of this well-known manager at Feltham, Middlesex, to Messrs. C. Lee & Sons, the old nursery firm. The deceased had been in the firm's service as manager some twenty-five years, and also undertook business journeys, so that he was very widely known. He was endowed with great energy, and no doubt proved a valuable servant. We learn that his very unexpected death is attributed to his having slept in a damp bed at Ashford in Kent recently, as he returned home very weak, and afflicted with great pain. The cause of death seems to have been intermittent fever and ague. His death occurred on November 18th, and his funeral on the 25th. This took place amidst great demonstrations of respect, a large number of Freemasons, of which body he was an active member, also attending.

- THE ROYAL HORTICULTURAL SOCIETY AND SOUTH KENSINGTON.-In consequence of a leakage from the Council of the Royal Horticultural Society a rumour was circulated about a fortnight ago of a proposal that the Society should emigrate to the old region of South Kensington, but under the circumstances we did not think it appropriate to make public reference to the subject. As the proposal was, however, freely spoken about in the Westminster Drill Hall last Tuesday there are no grounds for refraining from stating that it is understood that the question for making the Imperial Institute the headquarters of the Society is under consideration. It would perhaps be considered premature to discuss the matter in the absence of authoritative information; but it may be remarked that in the opinion of many persons the Society has of late become more consolidated, and what may be termed a settling down policy has been adopted with a gratifying measure of success. In consequence of this there are not wanting among its supporters those who look with a good deal of concern to anything of a disturbing nature occurring through a project of a speculative character. Is not the Imperial Institute itself essentially speculative? Is it sufficiently consolidated to justify a move in the direction indicated? and will it be safe to place the Society under the wing of a body of South Kensingtonian speculators? These questions are mooted as needing, what we may expect they will receive, the gravest consideration before any change that may be of a momentous character is finally decided upon. It is tolerably well known that the often dingy Drill Hall has no special charms for us, but we are bound to say that horticulturists have adapted themselves to it almost better than we could have anticipated, and there are several we suspect who at the present moment think it safer in this reference to "endure the ills we have than fly to others that we know not of." Possibly the Council of the Royal Horticultural Society in view of the disquieting rumours may think it desirable to make an official statement on the important subject, and show that if a change is intended there are reasons in its favour so strong as to be practically irresistible. N.B.-Since the foregoing was in type we are informed on the best authority that proposals emanating from the authorities of the Imperial Institute have been made to the Council with a view to the removal of the headquarters of the Society to South Kensington; a proposal which we have the satisfaction of announcing was not considered desirable in the interests of the Society.

NOTHING PAYS—A WAIL.

WE often read glowing accounts of the profits and benefits to be derived from fruit growing and market gardening. Personally I believe there are some, but not to so large an extent as some persons may imagine. A market grower from the west of England called here at the early part of this week. He gave an exceedingly doleful account of the work. His Apples and Pears were not worth gathering, price being so low, and bushels were spoiling; the same with Plums and bush fruits. He is of opinion that London is one of the worst markets

we have. I note a few wholesale prices in a western town. Peaches, large ones, 10d. per dozen; Grapes, 8d. per pound on the 18th November (Gros Colman); Tomatoes, 3d. per pound; Cabbages, 3d. per dozen; Celery, 6d. per dozen.

What conclusion can anyone come to after reading the prices realised with those given in horticultural papers, and those charged by the retailer? Is it the middleman or excessive railway rates that prevent the better distribution of vegetables and fruits about the country? The grower above referred to called at some London retail shops, offering to send to them direct, but they preferred going to the market. There is no doubt that the prices published from time to time are misleading. We need some re-arrangement, so that we can get something more authentic. I cannot but think that if the working classes and others would spendamore on vegetables and fruits, and less in other questionable ways, they and the country would be better for it. I may add that this west of England grower does not find Mushrooms a paying crop. I send his wail to the Journal of Horticulture.—A. J. BROWN, School of Handicraft, Chertsey.

The west of England grower is either in an unsuitable locality, has unfavourable soil, or in some way is lacking in the requisites which enable so many growers of vegetables and fruit to pay £5 an acre for the land and live, through their good judgment and effective work, in comfortable if not affluent circumstances. Some men are so satisfied with growing first-class garden produce for sale that they are, as far as is practicable, extending their operations. We are intimately acquainted with one market gardener who has been working 100 acres of land at a rent of £5 an acre, who has just taken twice the extent of land; also, we are in touch with a working man who commenced with less than an acre, who is now seizing all the vacant plots in his district at 1s. a rod, or £8 an acre. He does not trouble himself about published prices, but grows the best "stuff" he possibly can, has it ready as early as others (a little earlier if possible), and sells only first-class samples, taking his chance about prices. There are thousands of tons of garden produce for which there are no prices, and it cannot therefore pay for growing and sending to market.]

CROTON RUSSELLI.

As will be seen by referring to the accompanying illustration (fig. 71), this is a distinct Croton, and one that will probably be included in most collections. The plant from which the engraving has been prepared was exhibited by Messrs. Hugh Low & Co., Clapton, at a meeting of the Royal Horticultural Society on November 14th, a first-class certificate being awarded for it. When well developed the leaves are large and the upper surface is bronzy green, richly spotted and veined with yellow and red. The under surface is bronzy red. The plant appears to be of a dwarf habit, and will be useful for decorative purposes.

PRIZES AT THE FORESTRY EXHIBITION.

ALLOW me as one of the "unfortunate" prizewinners at the late Earl's Court Exhibition, to add a few remarks to "Exhibitor's" note, page 444. I wrote some two months ago to Mr. H. Milner, asking that the prize money due to me should be paid, and a few days later received a reply that my letter should be attended to in due course, and although in the schedule it stated that all prizes would be paid within a month of the Exhibition I have up to this date received neither money nor other reply. Like "Exhibitor" I thought such names as Mr. H. Turner and Mr. Milner were sufficient guarantee of proper civility and respect being shown to everyone. I know of one exhibitor whose expenses were considerably over £10, and who has all along looked forward to about as much prize money to repay him for expenses incurred. No reply whatever has been received by him to his application for the amount which he won.

As "Exhibitor" states, if anyone has received prize money it would be as well to at once say so, if not I think all should fall in with his suggestion and take the matter to court. I will willingly give my mite towards the cost, for I feel confident that exhibitors are fully entitled to the prize money due to them.

I was painfully surprised to learn from "Exhibitor's" letter that the donations promised to the gardeners' charities have not yet been paid, and I am sure it will come as a like surprise to a great many more, as I, with many friends, had often spoken of it as a most benevolent action and one deserving of the warmest praise.

Surely Mr. H. Turner, as the head of a most respected firm, and whose name has often adorned the pages of the Journal, will give us some explanation. If the Exhibition has been a failure, what have the officials to lose by at once saying so? If, on the other hand, they really intend paying, why not at once state the cause of the delay, and so settle

the matter? No one wishes to be unfair, and a few lines from either Mr. H. Turner or Mr. Milner would suffice.—Another Exhibitor.

[We had pleasure in giving publicity to whatever might be calculated to contribute to the success of the Earl's Court Exhibition, and have now, therefore, the less hesitation, in common fairness to exhibitors, to allow them to draw public attention to the position they are in. The letter of our correspondent, it will be conceded, is a temperate one, and we agree with him that an explanation is due, and we trust may be forthcoming under the very unusual circumstances now existing.]

A CALL AT CHILWELL.

In the last issue of the Journal at page 470 brief reference was made to Messrs. J. R. Pearson & Sons' Chrysanthemums, which are, however,

attention is being directed to the fruit, it must not be thought that the remainder is being neglected, for such is by no means the case. Each department is under the personal supervision of one or other member of the firm, cleanliness and good order prevailing throughout.

GENERAL PLANTS.

As the Chrysanthemums were mentioned last week attention will now be turned to general plants, which are grown in finely built structures erected by the well-remembered father of the present firm Mr. J. R. Pearson. Good as are the houses they are in no way superior to their contents, the plants throughout being in perfect health and free from any signs of insect pests. For Zonal Pelargoniums the firm has been renowned for many years, and is likely to be maintained if those now in bloom may be taken as a criterion. The plants have been flowering for months, and appear likely to continue doing so, for they are furnished with an abundance of buds. The plants are mostly of

FIG 71.—CROTON RUSSELLI.

only one of the many excellent features of this old established firm. It is my intention in these notes to refer to the plant houses and the extensive fruit tree nursery, each of which departments is in admirable order and replete with good things. A visit to Chilwell must always be full of interest, for at all times there is much to see. During the spring months the Narcissi, in which Mr. Duncan Pearson is taking such an interest, present a magnificent sight, as also do the fruit trees when they are bearing their delicately tinted flowers. Later the greenhouses will afford sufficient pleasure to repay a journey. Again, when fruit is hanging on the trees one could not do better than pay a call, and at planting time, when fruit trees are being sent away to all parts of the country, a spectacle of life and activity is presented such as will not perhaps be seen at any other season of the year. It was at this time when my visit was paid. So successful have Messrs. Pearson been with fruit trees that they are devoting every yard of available land to this department of their business; but though such a vast amount of

dwarf habit, and the blooms of much substance, with pips of perfect form and heavy trusses, which stand boldly out from the foliage.

On the back wall of the Pelargonium house, which is a lean-to structure, is growing Asparagus plumosus. That the position is admirably suited to this plant is evident by the luxuriant growths it is making, and which afford numberless fronds for decorative purposes at all times, but more especially during the early months of the year, when Maidenhair Fern is somewhat on the wane. Notwithstanding the freedom with which the Asparagus grows, Messrs. Pearson find it difficult to meet the demands, their cut-flower trade having developed to an extraordinary extent during the past few years. Eucharises, too, are largely grown, and are now affording an abundance of their chastely beautiful blossoms, which perhaps have no equal, and certainly no superior in many phases of decorative work. As a berried plant for the embellishment of rooms Adisia crenulata is splendid. The berries are brightly coloured, and the foliage of a dccp glossy green. With reasonable care and attention

these plants will last in a room in perfect condition for a long time, and it is surprising that they are not more popular. The stock at Chilwell is an extensive one, all the plants bearing the impress of careful attention and good health. On the roof of one of the intermediate houses Stephanotis floribunda is growing wonderfully, and must present when in full flower a perfect picture. I trust that on my next visit to Chilwell it will be in this condition, for I would much like to see it. Maréchal Niel Roses are evidently a speciality, and are largely grown. The plants are most noteworthy for the extraordinary growth and the admirable manner in which the shoots are ripened. Most assuredly they will produce an abundance of fine blooms. The plants are, however, grown for sale, and one would think that there were enough to supply all the growers in England, so great is the number. An unusual sight is seen in the two enormous banks of Adiantum, formed of huge, healthy looking plants, some of the fronds of which are of great size and substance.

The collection of Orchids cannot be called an extensive one, but if lacking somewhat in quantity it makes up in quality. Cattleyas, Odontoglossums, and Cypripediums are represented by beautiful plants, all of which are remarkable for their healthy appearance; but amongst the Orchids the Cœlogyne cristata must be accorded the premier position. The plump pseudo-bulbs and stout green leaves denote the way the plants are grown, and the condition they are in at present. They will give a number of beautiful flowers. This does not by any means exhaust the list of plants grown, and that well, at Chilwell; but mention must now be made of the fruit trees. Mr. C. E. Pearson, who takes charge of the plant and flower department, must be accorded a word of praise for the excellent condition of his charge, in which it need scarcely be said he takes the most intense interest.

FRUIT TREES.

The fruit tree department is under the active supervision of Mr. Alfred Pearson, and the state of the trees and the ground throughout is a striking evidence of his ability and intelligence. As in the other divisions of the firm, cleanliness and good quality appear to be the objects striven after, and but a glance suffices to prove how admirably these are achieved. At this season of the year the fruit department encroaches on that of the plants, inasmuch as one of the largest houses is devoted entirely to a show of Apples and Pears, arranged in dishes on a huge centre table. And a sight they present! All the popular varieties are represented, but the place of honour, both in the house and in the hearts of the members of the firm, is accorded to Newton Wonder. It is certainly a handsome Apple, and combines with its good appearance other high qualities rarely found in one variety. The tree is a splendid cropper, and the fruits colouring well are in great demand in markets. The flavour leaves nothing to be desired, and as it possesses exceptional keeping qualities, it is an Apple which cannot fail to be more largely grown than it is at present. Thinking so highly of it, the Chilwell firm has a grand stock. Young and old, trained and untrained trees are there in abundance, ready to be sent to their customers, and practically certain to give them satisfaction. Amongst the other Apples to be seen in the house were Wellington (Dumelow's Seedling), Potts' Seedling, the Apple par excellence for town gardens; King of the Pippins, Blenheim Orange, in superb condition; and Bramley's Seedling, in splendid form. Pears did not perhaps show to such exceptional advantage, but this may be accounted for by the visitor still having those beautiful Apples in his eye. However, some grand examples of the leading varieties are noticeable, and the Potatoes with which the end of the house is occupied would be a credit to any exhibition. Clean shapely tubers—some large, others small, but all firm and good—are there in abundance.

From the show of fruit a walk of ten or fifteen minutes brings us to the fruit tree nursery, and here on every side are seen the signs of a busy time. Thousands of trees have been taken up, and yet thousands remain. The stock of trees is a very extensive one. Upwards of thirty acres are entirely devoted to them, and the trees throughout are in splendid condition. Horizontally trained trees are a great feature at Chilwell, and as all are trained to a uniform measure, it will readily be imagined that their appearance is first-rate. Trained trees are there in all sizes, from the smallest up to the giant which is ready to fill a blank in the garden and commence cropping at once. No fear need be felt as to the advisability of buying such large specimens, for they have been regularly transplanted, and will lift with an abundance of those healthy fibrous roots which are so essential. The

trees are beautifully trained, and present an excellent appearance. Plums are represented by the thousand, and are carrying splendid wood, rich in promise of future crops. This is in fact applicable to all the trees in the nursery, for the shoots throughout are stout and perfectly ripened. The standards are magnificent trees and cover some acres of ground. The stems are straight, clean and sturdy, every one having had a stake attached to it. This will readily be recognised as a stupendous task, but it is only following what appears to be a rule of the firm—do everything well. Damsons, Apples, Pears and Plums, all are worth going to Chilwell to see. It would, of course, be impossible to particularise the varieties of fruits grown at Chilwell, their name is legion. No variety possessing good qualities is omitted from the collection, all receiving alike the same excellent and thorough culture. Grown on thoroughly prepared soil, better specimens could not be wished for. I spent a delightful time at Chilwell, for there is much to see and much to learn, and the hearty welcome accorded makes one feel at home at once. Let all readers of the Journal who can possibly do so visit Chilwell, they will be courteously received and see much which cannot fail to be of benefit to them in the future.—Nomad.

THE ROSE IN 1893. (Concluded from page 465.)

As I said last week, 1893 was not an amateur's year, and, therefore, we have no such record of success as that of the Rev. J. H. Pemberton some years ago, when from the beginning to the end of the season he carried all before him. But it was different with the professional growers. Messrs. Harkness & Sons, besides the challenge trophies already alluded to, carried off every first prize for seventy-twos in the kingdom, a record unique in itself and of which they may be justly proud. prowess of the northern growers was kept up to the very last, and at the Show at the Agricultural Hall at the end of August Messrs. Cocker & Sons of Aberdeen staged a remarkably fine collection of blooms, remarkable for their substance and brightness of colour. The Tea Roses were, as might have been expected, exhibited well, but the glory of the victory had passed from west to east, and while Somerset and Hereford were out of it East Anglia carried all before it and the flowers of the Revs. Foster Melliar and H. A. Berners will not be soon forgotten. Some of the Teas were exceptionally fine; never have Marie Van Houtte and Madame Cusin been exhibited as they were this year. The bloom of the latter shown by Rev. Foster Melliar at the National was certainly never equalled in any exhibition on this side of the Channel.

Madame Hoste has fully justified the expectations of those who thought that it only required time to win its way. A doubt still hangs over Ernest Metz as to whether it has got that constancy which exhibitors look for; of its beauty there can be no question. Whilst writing about Teas one cannot forbear alluding to the excellent manner in which Mr. Geo. Mount of Canterbury has exhibited this year. In a season when so early and so warm a place as Canterbury must have severely tried him, he has brought forward his Teas from the very earliest to the latest shows; his blooms have been always fresh and of good substance, and his stands have always contained the best leading varieties. Two other nurserymen who have occupied a more prominent place than beretofore are Messrs. Merryweather of Southwell and Messrs. Prior & Son of Colchester.

Passing away now from this rapid review of the season's Roses as far as exhibition varieties are concerned, let us ask in what way it has influenced what are ordinarily termed garden Roses. These comprising Hybrid Chinas, Hybrid Bourbons, Gallicas, and most single Roses, were over long before the exhibition season commenced, and consequently the display of them at our shows was in most cases deficient. Some very beautiful stands it is true were shown, but not in the quantity that one would have desired. And in truth the Rose season in our gardens was a very short one, but what we lost in July has been largely made up for us by the profusion and excellent quality of the flowers in September and October. I have seen Hybrid Perpetuals which have equalled the July flowers, while of Teas the display has been marvellous. The excellence of the flowers could not have been surpassed even in their normal blooming season, and the same account reached me from all quarters. And even as late as October 25th I could gather fresh coloured and good sized blooms from my own small collection.

Perhaps the most noticeable fact with regard to the excellence and number of Roses in October was furnished by the Oyster Feast at Colchester, when the tables were decorated by upwards of 4000 blooms, and although I was not there to see, being obliged to refuse the invitation, yet I am told that the flowers were exceptionally good, and the effect very striking. Colchester, too, possesses in Mrs. Orpen one whose taste in decoration has been proved so frequently, and I believe she helped not a little to carry out the arrangements; at least I am told it was her hand which made the buttonhole bouquets with which each guest was furnished.

In one respect the dry season has been propitious. Most of the shows have been held under favourable circumstances as regards weather with the somewhat unfortunate exception of the day on which the provincial Show of the N.R.S. was held at Worksop, and yet with all that I hear ominous sounds with regard to the probable endurance of many of them. It will be a matter I am sure of the sincerest regret if the contemplated breaking up of the Reigate Association takes place. I have been told by several who have attended many of the exhibitions that Reigate stood easily this year in front of all. Sad that it should be the last note of the dying swan. How many pleasant days have we spent there, and what a home of thoroughly good rosarians it was. Can one ever forget the pleasant meetings at the late Mr. Baker's, and after his death the gatherings round Mr. Hayward's hospitable board? But times are altered. Mr. Baker passed away some years ago, Mr. Waterlow's beautiful place at Great Doods is in the market, Mr. John Pawle has left Reigate, Mr. Sargent and Mr. West have pretty well given up exhibiting, Mr. Wollaston has long since retired, and when such defections as these take place we all know how difficult it is to revive an interest. On the other hand, new societies spring up. The enthusiasm for the Rose does not seem to diminish; as some of the veterans fall out of the ranks young and active recruits take their place, and yet one asks with some degree of misgiving, Where are the successors of the giants to come from? Ever and

anon we hear of some new amateur going largely in for Roses, as in the case of Mr. Tate of Leatherhead and Mr. Machin at Worksop, and we can only hope that many more of the same character may come forward, and that the Rose amateurs of the future may be worthy successors of the Jowetts and Bakers, the Halls and Whitwells of former days.— D., Deal.

PEARS IN 1893,

THE late summer and autumn fruits are nearly over, but it is no wonder after such a summer of agreeable sunshine. Take Pears for instance. With us Doyenné d'Eté, Beurré Giffard, and Jargonelle, three of the earliest, were all ripe in July. Williams' Bon Chrêtien, usually a late August and September Pear, was on a south wall fit to gather the end of July, and fit to eat the first week in August; but trees of it in the open, and on a wall with a north aspect, kept the supply on till the middle of September. This deservedly popular variety should be planted in this latter position, if there is space to spare. Louis Bonne of Jersey, Beurré Bosc, and Marie Louise were good, and suitable for use a month before the usual time, so also was Duchesse d'Angoulêmc.

I saw some fine French Duchesses in a fruiterer's shop in August' General Todleben, Forelle, Beurré Diel, Doyenné du Comice, and Brown Beurré were all good, but they are over now; and Glou Morceau is in use, when it has usually come in at Christmas time. The same may be said of Joséphine de Malines, a splendid Pear when grown against south walls. Beurré Rance is not ripe yet, and will prove serviceable. The free-bearing Nec Plus Meuris is not a very large Pear, but the quality is likely to be good this year. Many of them will be ripe in December, and possibly will last through January. There was no crop on Crasanne this year, when there is I have found it good for January.

A large bush of Nec Plus Meuris this year produced 3 bushels of clean it. Bergamotte Esperen, the latest of all kinds with me, planted as an orchard standard produced nearly 4 bushels, half of which, if they finish in the fruit room, will be fit for dessert, the rest will be rather small. These two last kinds should be in every collection of Pears for a late supply, although it is not every year that we have so favourable for Pears.

A free-bearing, medium-sized Pear for kitchen purposes I find in Bellissime d'Hiver, and will remain in use for a long time. comes very even and clean as an orchard tree, none very large, and no very small ones.—A. HARDING.

THOUGH I have no complaint to register with regard to Apples, and I hope to have a sufficient supply as long as usual, in the case of Pears I am not so sanguine. Not that the fruit is keeping worse than usual, for unless in the case of those that have been pecked by birds it is keeping very well; but the fruit is ripening so abnormally early that there is no likelihood of there being a supply to the usual time. For instance, our Marie Louise is now over, and in former years there was no difficulty in keeping it till Christmas. Winter Nelis, a variety which was wont to be in use during January and part of February, is now ripening, and I sent in the first dish on November 21st. Van Mons Léon Leclerc is quite ripe; Easter Beurré and Beurré Rance are softening. There is one redeeming feature however, and that is the splendid flavour most varieties developed. I do not remember Pears ever to have been so richly flavoured before, sorts that were only fit for stewing in most seasons being this year really well-flavoured.—B.

PEARS versus PEACHES.

THE article on Pears versus Peaches by "C.," in the Journal of Horticulture, September 21st (page 259), has brought out some different opinions. It may interest readers to learn that I had occasion to buy Peaches the first week in September. There were a great number that could not be sold at any price owing to the glut. I paid from 1s. to 3s. per dozen. They were of splendid colour and of good flavour. This was at Doncaster during the races; a week previous they could be bought at any price.

I had a good crop of Pitmaston Duchess Pear, which I gathered a week or two after, and sold them all in the trade to sell again at 10s. per dozen. There was not a fruit under a pound weight; the heaviest weighed over 1½ lb. My employer was rather interested in them when growing, as he thought such large Pears would be useless to eat, but after tasting one he said it was one of the best flavoured Pears

he had ever tasted.

I was surprised when I read "E. M.'s" (page 373) remarks anent Beurré Diel being of no flavour. In Yorkshire it is perfect in flavour. We have some grand fruit of it this year. Clapp's Favourite, which is condemned by some as having no flavour, is very good with us. It must be the soil, as we never water our trees. The past season has just suited the land, which is on the magnesian limestone. Durondeau, Winter Nelis, and Doyenné du Comice are now in perfect condition, but Thompson's and Duchesse d'Angoulême are no better than a Turnip.-Northerner.

THE HESSLE PEAR.

REFERRING to the interesting note respecting this popular Pear from Mr. Lord (page 469), I draw attention to the fact that all round London in numerous old orchards it was evidently the one Pear for market growth and sale. Nearly all the old trees we still see standing about in the suburbs are of the Hessle, and young trees are still largely planted. The market men persist in calling the variety "Hazel," but as the calling things by other than correct appellations is a very common as the calling things by other than correct appellations is a very common

feature in the market trade, it rather than otherwise supports Mr. Lord's The tree is a very handsome grower, presenting in standard form the most perfect of pyramidal heads, the young growth wearing a drooping aspect. It is one of the hardiest of Pears, and should make an excellent secondary stock for double working. It is also an almost constant fruiter, and although the fruits are smallish and of very poor quality, yet because they can be gathered early, and are abundantly produced, seems to be profitable, and that is all the market grower troubles about.—A. D.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 28TH.

THE meeting on this occasion was a comparatively small one, and but few exhibits were forthcoming. Some Orchids were staged, whilst Zonal Pelargoniums and Chrysanthemums made a fair display. Fruit was only moderately represented.

FRUIT COMMITTEE .- Present: Philip Crowley, Esq. (in the chair), Rev. W. Wilks, Dr. Hogg, T. F. Rivers, H. J. Pearson, Harrison Weir, J. Cheal, G. Goldsmith, G. Bunyard, W. Warren, A. Dean, A. H. Pearson, F. Q. Lane, H. Balderson, J. Hudson, G. Wythes, A. J. Laing, G. T. Miles, and J. Wright.

The duties of the Committee were the reverse of heavy, but interesting and well-grown specimens were submitted for examination. The English Fruit Growing Company, Hereford, sent a dish of very fine Apples, named Byford Beauty. The fruit was quite as large as Warner's King, yet distinct from it, being firmer and heavier. were said to have been borne by an orchard tree, described as an excellent grower and free bearer. Mr. J. Watkins, Pomona Nurseries, Hereford, also despatched fruits, but they had not arrived. This is not a new Apple, but is grown in the neighbourhood of Hcreford, and there

esteemed. An award of merit was voted unanimously. At a meeting in September an award of merit was granted to Messrs. W. Brown & Sons, The Nurseries, Wells, for Bartlett's Glory Apple, the fruits of good size and attractively coloured. They were taken to Chiswick for testing their keeping, but on being examined now were found to be partially decayed, and consequently no advance was made on the September award. Mr. Bunyard sent fruits of Christmas Pearmain, a good sized conical fruit with a tender flesh and pleasant flavour, but over-ripe; also highly coloured medium sized fruits of Foster's Scarlet Prolific of the Cellini type; and Messrs. J. Peed & Sons sent a dish of Ouseley's King of the Valley Apple, being in appearance intermediate between Queen Caroline and Golden Noble. No awards were made for the varieties mentioned. Mr. T. Arnall, Brookside, Headington Hill, Oxford, sent remarkably large specimens of Uvedale's St. Germain Pears. Twelve of the fruits grown by Mr. Arnall weighed 27 lbs. 6 ozs., the heaviest Pear being 3 lbs. 8 ozs. in weight. Eleven out of the twelve fruits were placed on the table, and a bronze Banksian medal was unanimously recommended.

The Liverpool Horticultural Company sent bunches of the Hamburgh Colman Grape. The variety originated with Mr. E. H. Woodhall, St. Michael's, Scarborough, and was said to ripen a month earlier than Gros Colman and flourish in cool vineries. The best bunches exhibited were produced from a Vine inarched on another variety (not named) at Allerton, Liverpool; but the Grapes were described as the most tasteless ever tasted by the Committee. Some berries from the original stock were better, but their appearance, through injury in transit, the

reverse of tempting, and no award could be made.

A large and well-grown cluster of Bananas (Musa Cavendishi) was sent by Mr. J. Quarterman, gardener to C. E. Smith, Esq., Silvermere, Cobham, and a cultural commendation promptly awarded. Chantrier Frères, Mortefontaine, France, sent fruits of the Persimmon, Diospyros Kaki, but they were not in good condition, and it is very rare indeed, if ever, that Persimmons are placed before the Committee in satisfactory condition.

Mr. G. Goldsmith, gardener to Sir E. G. Loder, Bart., Leonardslee, Horsham, exhibited a very fine collection of thirty dishes of Apples and twelve of Pears, all of first-class exhibition quality. The Pears were fine and the Apples beautifully coloured, Barnack Beauty was perhaps never seen in richer crimson garb. It would have gladdened the eyes of Mr. Richard Gilbert, who, we think, "discovered" this variety in the neighbourhood of Stamford. A silver Knightian medal was unanimously recommended for this most creditable collection of fruit.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); Messrs. R. Owen, Chas. F. Druery, H. Herbst, R. Dean, G. Stevens, C. F. Bause, C. J. Salter, Geo. Gordon, J. D. Pawle, C. Jeffries, Jas. Walker, C. E. Shea, T. Baines, C. Noble, H. Cannell, and Peter Barr.

Messrs. Hugh Low & Co., Bush Hill Park Nurseries, Enfield, staged a collection of Cyclamens, the plants in which were sturdy and finely flowered. Greenhouse plants were also staged by the same firm (silver Banksian medal). Messrs. Henry Cannell & Sons, Swanley, arranged a collection of Zonal Pelargoniums, conspicuous alike for the perfect contour of pips and large size of the trusses. Amongst the most prominent were Etoile de Lyon, Launcclot, Lucrece, Madame de Bondeville, King of the Purples, W. P. Wright, and Albion. Chrysanthemums were also staged by Messrs. Cannell. The blooms were of fine shape and substance. Robt. Flowerday, C. Westland, Judge Hoit (award of merit, see below), Golden Wedding, Mrs. C. Harman Payne, Golden Ga'e (award of merit, see below), Mdlle. Thérèse Rey, Robert Owen, and Madame Ad. Girard were the most noticeable (silver Banksian medal).

Mr. Robert Owen, Maidenhead, showed some handsome Chrysanthemums, including Mrs. John Gardiner (award of merit), Mrs. J. Mitchell (award of merit), Sir Titus, Walter Surman, E. L. Jamieson, H. M. Pollett (award of merit), John Noble, H. L. Sunderbruck, Elsie Walker (award of merit), Little Pet and Le Prince du Bois (award of merit). Mr. C. Blick, The Warren, Hayes, showed blooms of Chrysanthemum Helen Crawford. Mr. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, showed magnificent flowers of Lord Brooke, Elmer d'Smith (award of merit). Chrysanthemum Eric was shown by Mr. Duncan, gardener to C. J. Lucas, Esq., Wareham Court, Horsham. Mr. J. Rcynolds, Netley Castle, exhibited Chrysanthemum Lady Emma. A cultural commendation was accorded to Mr. Blandford, gardener to Mrs. Haselfoot, Moorhill, Southampton, for pots of yellow Chrysanthemums. Begonia Madame Lebourg was shown by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, and it appears to be a variety of much promise. A first-class certificate was accorded to Mr. May for Acalypha Macafeena, which is described elsewhere. A handsome piece of Aglaomorpha (Polypodium) Meyeniana was also shown by Mr. May, and awarded a first-class certificate (see below). Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, showed a small collection of plants, and received a vote of thanks. Lachenalia pendula, Leontice Leontopetalum, and Narcissus monophyllus were represented. Blooms of Lilium nepalense were shown by Messrs. H. Low & Co.

The group of foliage and flowering plants arranged by Mr. G. Wythes improved what was otherwise a sparse meeting. Calanthe Veitchi superba, Cypripedium insigne, Poinsettia pulcherrima, Palms, Crotons, Dracænas, and Ferns were all of exceptional merit, and well deserved the silver Flora medal which was awarded. Sterculia nobilis in fruit was shown by Mr. Wythes, and received a vote of thanks. A cultural commendation was accorded to Mr. Latham, Botanic Gardens, Birming-

ham, for splendid piece of Callicarpa purpurea.

Prizes were offered for groups of Chrysanthemums, the first being awarded to Mr. E. Vince, gardener, Highgate Cemetery. The plants were well grown and flowered, and included amongst others, Mons. Bernard, Florence Percy, Viviand Morel, and Val d'Andorre; Mr. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, being accorded the second position.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); Dr. Masters, Messrs. Jas. O'Brien, H. M. Pollett, Thos. Statter, W. H. White, E. Hill, Jas. Douglas, T. B. Haywood, and F. Sander.

Messrs. F. Sander & Co., St. Albans, sent some choice Cypripediums, including C. Lynchianum (C. Spicerianum × C. selligerum majus),

C. Pyrorianum, Calanthe Sandhurstiana, a bright rosy red flower, and a basket of Calanthe Victoria Regina, tastefully arranged with Asparagus plumosus nanus. An award of merit was adjudged for this Orchid, which is described elsewhere. Mrs. Haselfoot, Moorhill, Southampton (gardener, Mr. N. Blandford), sent a dozen grand spikes of Cattleya labiata, and a vote of thanks was accorded. W. R. Lee, Esq., Beech Lawn, Audenshaw, Manchester (gardener, Mr. J. Billington), sent Cypripedium Leeanum superbum and C. Mary Lee (award of merit). Messrs. B. S. Williams & Son, Upper Holloway, procured an award of merit for Calanthe Mylesi, which is described below. Walter Cobb, Esq., Dulcote, Tunbridge Wells (gardener, Mr. J. Howes) sent Cypripedium & Cobbianum. Tunbridge Wells (gardener, Mr. J. Howes) sent Cypripedium × Cobbianum. T. Statter, Esq., Stand Hall, Manchester, had Cypripedium Fairiano-Lawrencianum (award of merit), and Lælia anceps Amesiana. A firstclass certificate was awarded for the last-named plant, and a description of it is given elsewhere.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, sent a small collection of choice Orchids. These included Catasetum Darwinianum and Cypripedium Minos, for which awards of merit were adjudged. The same firm had a plant of Habenaria ciliaris, and a botanical certificate was awarded for this. R. J. Measures, Esq., Cambridge Lodge, Camberwell, secured an award of merit for Cypripedium insigne var. Illustre, a distinct form. Messrs. Hugh Low & Co., Clapton, had a few Cypripediums and a plant of Vanda Sanderiana.

CERTIFICATES AND AWARDS OF MERIT.

Acalypha Macafeeana (J. Veitch & Sons).—This is a splendid foliage plant. The largest leaves on the plant exhibited were nearly a foot in length and 8 inches wide. The upper surface is bright red blotched brown, the under part being also red (first-class certificate).

Aglaomorpha (Polypodium) Meyeniana (H. B. May).—This is a splendid Fern from the Philippine Islands. The fronds are more than 2 feet in length and a graceful habit. It is conservable a good Fern for

2 feet in length, and a graceful habit. It is apparently a good Fern for

growing in a basket (first-class certificate).

Calanthe Mylesi (B. S. Williams & Son). — A charming white Calanthe, the result of a cross between C. nivalis and C. Veitchi (award of merit).

Calanthe Vietoria Regina (F. Sander & Co.).—This is an exceedingly pretty form, and was raised by Sir Trevor Lawrence, Bart. A card on the plant exhibited stated "it was probably from C. Veitchi and Limatodes rosea." The flowers are large, blush pink, with a faint

tinge of yellow in the throat (award of merit).

Catasetum Darwinianum (J. Veitch & Sons)—A very fine species from British Guiana. The flowers are a curious mixture of brown,

green, and creamy white (award of merit).

Chrysanthemum Le Prince du Bois (R. Owen).— A splendid Japanese variety of a bright yellow shade (award of merit).

Chrysanthemum Little Pet (R. Owen).—A pretty English-raised Pompon, brownish red in colour (award of merit).

Chrysanthemum Elise Walker (R. Owen).—A brick red Pompon

edged with yellow (award of merit).

Chrysanthemum H. M. Pollett (R. Owen).—An English-raised seedling of Viviand Morel type, fine flower, rich rosy pink (award of merit).

Chrysanthemum Mrs. J. Mitchell (R. Owen).—An incurved sport from Empress Eugénie. Flower medium sized, and of a golden amber creamy shade faintly suffused with rose (award of merit).

Chrysanthemum Mrs. John Gardiner (R. Owen).—An incurved

variety, clear yellow, good shape.

Chrysanthemum Elmer d' Smith (T. B. Haywood, Esq.).—A large Japanese, dull crimson, silvery reverse (award of merit).

Chrysanthemum Golden Gate (H. Cannell & Sons).—A fine reflexed

Japanese, broad florets, clear yellow (award of merit).

Chrysanthemum Judge Hoit (H. Cannell & Sons). — A large
Japanese Anemone, soft rose colour (award of merit).

Cypripedium Mary Lee (W. R. Lee, Esq.). — This is the result
of a cross between C. Leeanum and C. Arthurianum. The dorsal sepal is large with a deep white margin, spotted violet purple. The base is green, spotted brown. The petals and lip are green, shaded brown (award of merit).

Cypripedium Fairiano-Lawreneianum (T. Statter, Esq.).—A distinct hybrid, being the result of a cross between C. Fairieanum and C. Lawrencianum. The dorsal sepal is white and green, heavily veined with purple. The lip is bronzy green, while the petals, which droop, are green spotted and margined purple (award of merit).

Cypripedium Minus (J. Veitch & Sons).—This is a beautiful hybrid.

It is the result of a cross between C. Anthurianum and C. Spiceranum.

The dorsal sepal is large, the greater portion white, densely spotted crimson. The lip is dark shining brown, and the petals are yellowish green, veined brown (award of merit).

Cypripedium insigne var. Illustre (R. J. Measures, Esq.).—A very fine form of the well known type. The dorsal sepal is yellowish green, covered with large brown spots, and a distinct white tip. The lip is a bright brown, tinged with yellow, as are the petals (award of merit)

Lælia anceps Amesiana (T. Statter, Esq.).—This is a beautiful form of L. anceps. The sepals and petals are white, tinted rosy purple. The front portion of the lip is very richly coloured, purplish magenta, the throat being veined crimson and yellow (first class certificate).

VIOLAS.

I HAVE read with much interest "W. D.'s" contribution (page 438) on new Violas. As I cultivated, very successfully for the most part, during last summer the great majority of the beautiful varieties which he so expressively characterises, I am perhaps in a position to endorse his remarks. I may state that the following are my favourite Violas, which I can strongly recommend to cultivators of this interesting flower—Countess of Wharncliffe, Duchess of Fife, Bridesmaid, Lemon Queen, Edina, Countess of Kintore, H. M. Stanley, White Duchess, White Flag, Violetta, Sylvia, and Countess of Hopetoun. Of these the most charming are Countess of Wharncliffe, delicate satiny white; Violetta, the most graceful and highly perfumed of Dr. Stuart's miniature Violas, and Duchess of Fife. I think the last mentioned is superior to White Duchess, which, unless in complexion, it resembles very much. It is perhaps heroic as well as conservative to make this assertion, after being assured by Mr. Wm. Cuthbertson of Rothesay, for whose opinion, nevertheless, I have the greatest respect, that White Duchess, which is the latest production of Mr. Baxter of Daldowie in Perthshire, is "the sweetest Viola in cultivation."

Edina, justly eulogised by Mr. Wm. Dean of Birmingham (who has practically written the Viola into its present popularity), is, I understand, a sport or variation from Countess of Kintore. During last September, after keeping stationary in aspect for several months, it began to be eccentric, and produced, to my gratification, several flowers entirely distinct from the original "Edina," of much darker colour and velvety hue.—DAVID R. WILLIAMSON.

FLORAL NOMENCLATURE - CURIOUS SPELLING OF NAMES.

I HAVE read with interest the paragraphs which have appeared in the Journal of Horticulture from time to time on the above subject. We all agree, I think, that gardeners are not expected to be versed in Latin, Greek, German, and French; but I think the exhibits at our shows ought to be correctly labelled for the benefit of the visitors. If the exhibitor cannot do it, surely the Secretary or some official connected with the arranging of exhibits could.

In visiting some of the recent Chrysanthemum shows I have noticed the following, amongst others, inaccurately spelt, in addition to the writing being illegible: For Miss Haggas, "Miss Hageas;" for Etoile de Lyon, "Etole de Loyn;" for Nil Desperandum, "Nil Desperande;" for Audiguier, "Audeger;" for Bahuant, "Bahant," and similar errors which could easily have been avoided by copying the names from a catalogue. I hope gardeners will avail themselves of the apportunities catalogue. I hope gardeners will avail themselves of the opportunities now offered by the County Councils, whereby we can improve our knowledge in subjects pertaining to gardening.—S. H.

I MUST disclaim any desire to make "West Anglia" (page 466) appear responsible for the advocacy of a classical training for gardeners.

My point was, that if one is to be satisfied with nothing short of perfection in the spelling and pronunciation of foreign languages, such training is indispensable. I had no intention of charging "West Anglia" with inability to correctly decipher the mis-spell labels to which he referred. Whilst allowing that the exhibitor was in fault, I suggested that some of the mistakes read as if the words were copied from labels on which but a few legible letters remained. Of course a gardener should see that his labels are always readable; but somehow, especially where single-handed gardeners are employed, labels have a way of becoming periodically obliterated, and the gardener, whose time is entirely occupied in the culture of his charges, finds on the eve of the exhibition that a few isolated letters represent the name. Then comes an attempt to copy the words as near as may be. This I know from experience is what not infrequently occurs, and I have, happily, been sometimes able to help exhibitors to rectify their errors before the advent of the judge. However, as "West Anglia" says, this is negligence, and while not defending the delinquents, I ask for a lenient judgment.-S. W. F.

HULL CHRYSANTHEMUM SHOW, 1894.

WE learn that the annual Exhibition of the Hull and East Riding Chrysanthemum Society will next year be held on November 14th and Messrs. G. Gordon, E. Molyneux, and J. Wright have been invited to act as judges.

MR. MOLYNEUX IN IRELAND.

I SPENT two hours with Mr. Molyneux yesterday (21st inst.) and they were two valuable hours to me, but I am sadly disappointed that his first impressions of Ireland cannot be favourable to us. are humiliating; brought over as he has been to an amateur society at a small place where two rival shows are held. I feel rather strongly on this matter, for I was anxious that poor Ireland should be seen at its best, not at its worst, and I do not consider that the remains of the Chrysanthemum feast that have been set before the "Chrysanthemum king" have been a dish worthy of him or of us.—PADDY.

INCURVED JAPANESE CHRYSANTHEMUMS.

MAY I ask some of your correspondents if Léon Frache and Mdlle. Marie Hoste belong to the incurved Japanese section? At the Reading Chrysanthemum Show the Society asked for twelve Japanese incurved, distinct, and the stand that was placed first had the above mentioned varieties in the twelve. I did not know they belonged to that section, nor can I find them in the N.C.S. catalogue as such, and the Reading Chrysanthemum Society is affiliated with the National.—BEGINNER.

[If "Beginner" refers to our instructions to correspondents on page 500 he will find these words: "All articles intended for insertion should be written on one side of the paper only."]

AN AMATEUR'S CHRYSANTHEMUMS.

It is a well-known fact that Chrysanthemums are now grown nearly as well by amateur cultivators as by most professional gardeners, and, in the majority of cases, the former are well represented at exhibitions. Around the metropolis thousands of amateurs take a keen interest in Chrysanthemums, and amongst others that have come under our notice, the collection brought together by Mr. A. Barrett, Alexandra Road, Hornsey, is deserving of mention. Although not an exhibitor, this gentleman is an enthusiastic grower, and considering his comparatively brief experience in the matter, he has managed to produce some remarkably fine blooms of the leading varieties. The plants are principally grown for decorative purposes and for some weeks past Mr. Barrett has had a charming display in the conservatory at his suburban residence.

CHRYSANTHEMUM CHAS. DAVIS.

I THANK "P." (page 470) for his reply, but I do not consider his answer a very satisfactory one. The introducer of Chas. Davis describes the colour as "clear rosy bronze," and as such I have seen many blooms this season. The certificate was awarded to blooms of a pale yellow slightly tinged with bronze on the outer florets. From "P.'s" remarks I gather that small undeveloped blooms of the orthodox hue would be passed over for large blooms of much less colour. If he will refer to my query he will notice that I stated the blooms which were passed over were "perfect in shape, fresh and equal in size" to the faded blooms to which the certificate was awarded. I have always understood that fair-sized, fresh, highly coloured blooms of Etoile de Lyon, Mons. Bernard, Viviand Morel, and many others counted many points more than larger paler blooms of the same varieties. I know they are much more difficult to grow. Surely size is not the standard of the N.C.S. Floral Committee.—QUERIST.

THE N.C.S. AND ITS CERTIFICATES.

"P." (page 470), in answer to my complaint of the bad light, points to the Drill Hall, and comforts himself with the idea that the

R.H.S. arc no better off in this respect than the N.C.S. As I think I have already seen quoted in the Journal, "two wrongs do not make one right." But I cannot allow that the Floral Committee of the Royal Horticultural Society sit in anything like such darkness as the Floral Committee of the National Chrysanthemum Society did on the 8th inst. What is more, the R.H.S. meet at midday and the N.C.S. at a later hour. When the last-named Committee rose on the 8th it was near four o'clock, and hardly possible for those sitting at the head of the table to distinguish those at the bottom. I find the R.H.S. are more lavish than the N.C.S. with their certificates; will the latter follow the Royal in this? I hope not; but according to "P.'s" argument they should. It may be a comfort to the N.C.S. that the R.H.S. are no better off for light, but it will not console those who send blooms for certificates .-A MUMMER.

CHICAGO CHRYSANTHEMUM SHOW.

A PRIVATE correspondent in Chicago has sent me a note concerning the great Show recently held at the World's Fair, Chicago, which he says is the largest they have ever held there. The admission fee was fifty cents., and the takings at the doors amounted to about £1800 (9000 dollars). In the "American Florist" is a long report of the proceedings, by which it appears that there were exhibits from twentyone different States including Canada, and that, exclusive of seedlings and undistributed kinds, about 110 varieties were staged. As may be imagined most of these were of American origin, but it is gratifying to find that our Yankee friends do not wholly rely upon native-raised varieties, and that there was a fair number of novelties from the Old World growers. The best of these were Mons. R. Bahuant, Chas. Davis, H. Cannell, Jeanne Delaux, Domination, Bertha Flight, L'Enfant des Deux Mondes, Kate Mursell, Robert Owen, Mdlle. Thérèse Rey, William Seward, Source d'Or, and Viviand Morel.

Most of the cut blooms appear to have been set up in vases, sometimes fifty in each, and illustrations are given of the collections staged

by the leading prizewinners.—P.

CERTIFICATED CHRYSANTHEMUMS.

On Wednesday, the 22nd inst., the Floral Committee of the National Chrysanthemum Society held a meeting at the Royal Aquarium, when Mr. Geo. Gordon occupied the chair. There were some remarkably fine exhibits submitted for adjudication, and the principal awards were as follows:—A silver medal to Mr. Robert Owen of Maidenhead for an excellent collection of novelties, principally English seedlings. A silver medal to M. Ernest Calvat for an interesting collection of his seedlings raised this year, and which, in spite of the long journey from Grenoble, had arrived in very much better condition than some of the previous ones sent. A bronze medal to Messrs. H. Cannell & Sons for a collection of cut Chrysanthemums, in which were some attractive novelties.

First-class certificates were granted to the following:-

William Tunnington (R. Owen).—A very large incurved flower, colour deep golden bronze and crimson.

Mrs. T. Denne (R. Owen).—An American raised incurved Japanese variety of good size and substance. Colour a deep rosy purple.

Prince du Bois (R. Owen).—This is a large globular Japanese flower,

with narrow, curly florets of pure yellow.

Golden Gate (R. Owen).—A Japanese with spreading florets, a large bloom, colour deep bronzy yellow, and the petals of considerable length. Cevil Ray (E. Beckett).—An English raised variety. A fine Japanese flower with long, flat florets, colour pure yellow.

Mdlle. Carnot (E. Calvat).—This variety is one of the largest French seedlings we have seen. The florets are pure white, rather grooved and

curly, and the bloom very full.

Professor Lackman (E. Calvat.)—An incurved Japanese. Colour

purple amaranth, with a rosy reverse.

There were many other large and attractive flowers, but unfortunately they were inclined to be somewhat rough and coarse. Le Colosse Grenoblois was simply gigantic, but its condition precluded the Committee from dealing with it beyond expressing a wish to see it again. Deuil des Jules Ferry, a rosy amaranth Japanese, and President Leon Say, a golden and chestnut bronze flower, were commended, both being in M. Calvat's collection with the one previously mentioned. Celtic, an attractive Anemone, colour rosy chocolate. President W. R. Smith, a pale blush incurved Japanese; Niveus, a white American Japanese; E. L. Jamieson, a bright crimson Japanese; Elsie Walker, a pretty orange bronze Pompon, all in Mr. Owen's collection, were also commended. Wm. Kendall, a reflexed Pompon, rosy mauve and white, was another.

Some fine looking incurved blooms were staged, the best being Mrs. J. Gardiner, which the Committee thought too closely resembled Mrs. Coleman. Lord Rosebery, a large purple bloom of good size, was considered to approach too pearly to Violet Tomlin.

CHRYSANTHEMUM SHOWS.

CHESTER PAXTON SOCIETY .- November 21st and 22nd

THIS Exhibition, held in the Town Hall on the 21st and 22nd inst., was one of the best the Society has brought together. The exhibits from point of numbers and quality exceeded anything that had been seen in the old city before. This is all the more creditable from the fact that the Society started in a comparatively small way four years ago at the Grosvenor Museum, and also when it is remembered that such fine

shows of fruit and Chrysanthemums are held so near as Liverpool. The groups of Chrysanthemums arranged for effect were very good, there being a lightness and graceful blending of colours about them, the want of which often mars more pretentious groups.

The competition in the cut bloom classes was very keen, there being some fine blooms of Princess of Wales, Violet Tomlin, Lord Wolseley, Mrs. Heale, and Golden Empress among the incurved, and Viviand Morel, E. Molyncux, Lord Brooke, Sunflower, Etoile de Lyon, and Colonel

W. B. Smith among the Japanese.

Apples, which are usually well grown in Cheshire, were exhibited in grand form. The County Council through its lecturers (four of which by the way are leading members of the Paxton Society) are doing all they can to encourage this branch of fruit culture. In the classes for Pears the effects of the past summer, and the now general complaint of fruit not keeping well, were very manifest by the absence of some of the best dessert varieties.

The Society's silver medal for the best fifty dishes of Apples brought two fine exhibits, one from Mr. J. Watkins, Pomona Farm, Hereford, and the other from Mr. Bunyard, Kent, which for size, quality, and finish would be difficult to beat, and it is very doubtful if a finer table of Apples has been exhibited anywhere this season than these made. The former, however, won the medal by a few points in colour.

In the evening a Fruit Conference was held, the ex-Mayor presiding, when papers was read by Mr. E. S. Baillie, F.L.S., on "Fruit and Fruit Growing." Mr. Watkins followed with one on "Gathering, Storing, and Marketing Apples and Pears," after which Mr. Newstead gave the results of "Recent Investigation on the Currant Bud Mite."-M. F. B., Eaton.

SUTTON COLDFIELD.—November 22nd.

THE Sutton Coldfield Gardeners' Association is an offshoot from the Birmingham Gardeners' Association, and was formed because of the inconvenience to many in going to Birmingham to the meetings. It is an admirably worked affair, and many young men engaged in gardening have joined. As the Chrysanthemum has "caught on" at Sutton and in the district, an annual Exhibition takes place, and there has been such a marked improvement in the cultivation of them, that a small but excellent show was produced on the 22nd inst. in the Town Hall of Sutton Coldfield.

Four excellent groups were arranged, the first prize going to Mr. J. G. Pears, gardener to J. D. Rippingille, Esq.; second, Mr. R. Popnell, gardener to W. H. Tonks, Esq.; third, Mr. James Padbury, gardener to R. H. Bunn, Esq.; fourth, Mr. Albert Jeffs, gardener to H. E. Yates, Esq. In the class for smaller groups where only one gardener is kept, Mr. H. Warren, gardener to J. H. Lloyd, Esq., was first.

A few well grown plants in pots were staged, cut back, bushy, and well cultivated, averaging from 2 to 3 feet through, a marked improvement on the old tying down system, and the Japanese varieties grown in this natural style were very effective. Mr. Peace was first in the classes for these.

The cut blooms were not numerous, but some fine ones were staged, and here again Mr. Pease was first for twelve Japanese blooms; second, Mr. A. Jenkins, gardener to A. W. Wills, Esq., J.P.; third, Mr. A. T. Bath, gardener to C. H. Pugh, Esq. In the class for twenty-four blooms, twelve incurved and twelve Japanese, Mr. Hughes, gardener to W. L. Hodgkinson, Esq., was first; second, A. W. Wills, Esq.

Some good Primulas, specimen stove or greenhouse plants and table plants were staged for prizes, in another class of members, where only one gardener is employed. Mr. Popnell was first; Mr. George, gardener

to E. T. Shannon, Esq., second; and Mr. Clark, third.

Mr. A. W. Wills, who has been an Orchid cultivator for years, sent a group, not for competition, including some Cypripediums and Dendrobiums, and Phalænopsis; and Mr. Groves, the Hon. Secretary, sent from his nurseries a large group of Chrysanthemums and cut blooms.

The vegetables were a striking feature of the Exhibition, many of them being of exceptional quality. Collections in the open class for members were both numerous and of excellent quality. Mr. T. Garland, gardener to C. Rhodes, Esq., was first; Mr. Popnell second; Mr. T.

Huxley third.

Still another class for six varieties of vegetables, for members who Still another class for six varieties of vegetables, for members who have no greenhouse, and some excellent exhibits were staged. Mr. J. Deville, Mancy, Sutton Coldfield, was first; second, Mr. Joseph Horton; third, Mr. George Gibbs. Mr. Deville was first for six Parsnips of great size and finish; also first with the finest Leeks in the Exhibition, and of great weight. Mr. W. Halford, the Royal Hotel, Sutton Coldfield, was first for six dishes of Potatoes, good clean tubers of Interior, and the six dishes of Potatoes, good clean tubers of Interior. national, Vicar of Laleham, Sutton's Abundance, Paragon, Mr. Breesee, and Prizetaker.

Each year prizes are offered for collections of fungi, and this season two somewhat extensive collections were staged. First, Mr. George Gibbs; second, Mr. A. Horton, both working men employed on the railway. Botany is encouraged by the Committee of the Association, and Mr. Groves is a thoroughly good leader as well as Secretary, and the adjacent park and woods of about 1800 acres, rather rich in choice British plants, afford a good hunting ground for the members. The Association possesses a small but very useful library of gardening books, and only members are allowed to exhibit for prizes at the November Show.

BARFORD.—NOVEMBER 23RD AND 24TH.

THE second annual Chrysanthemum Show, which was held at Barford Hill, was a decided improvement on that of last year and

there is every reason to believe that the Show which will rapidly increase in importance has been successfully inaugurated. Financial difficulties which so many young societies encounter are entirely absent in this instance, thanks to the liberality of Mr. and Mrs. Smith-Ryland, who also evince great personal interest in the arrangements, which are admirably carried out by Mr. J. Gourlay, the energetic Secretary.

Chief interest was centred in the cut bloom classes in which Mr. H. Dunkin, gardener to the Earl of Warwick, Castle Gardens, Warwick, secured the premier position for both twelve incurved, and also for the same number of Japanese in distinct varieties. The competition in the latter class was particularly close, each exhibitor having excellent stands of blooms. Mr. Finch, gardener to W. R. Mann, Esq., Leamington, was second, and Mr. H. Liney, gardener to W. M. Low, Esq., Willesbourne House, third. For six incurved distinct, Mr. Finch was first, Mr. Dunkin, second, and Mr. Liney, third. For a similar number of Japanese, Mr. Dunkin was again to the front, followed by Mr. Liney and Mr. Skelcher, gardener to E. K. Little, Esq., Newbold Pacey, Warwick, each exhibitor having excellent blooms. Mr. F. Williams was first for a group of Chrysanthemums. Mr. Finch occupied a similar position for bouquet of Chrysanthemums, and Mr. Skelcher for a cross.

Table plants were well shown, the first prize going to Mr. J. Simpson, gardener to W. M. Smythe, Esq., The Lawn, Warwick, the same exhibitor securing first honours for three dishes of dessert Apples, and second for black Grapes, an equal second being also awarded to Mr. Liney. Mr. Finch was placed first for both black and white Grapes and culinary Apples (three dishes), while for the same number of Pears Mr.

L. Skelcher occupied the post of honour.

Non-competing exhibits made a fine display. Foremost among them must be noticed the numerous stands of splendid Japanese flowers staged by Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., Barford Hill, which made an imposing display. Two grand bunches of perfectly coloured Gros Colman Grapes and two of Alicante were staged by Mr. J. Ketly, Castle Nursery, Warwick, who also exhibited a fine dish of Tomatoes, culture of the highest excellence being apparent in each exhibit. Mr. F. Perkins of Leamington arranged an attractive group in good style.

ECCLES, PATRICROFT, PENDLETON, AND DISTRICT. NOVEMBER 24TH AND 25TH.

THE seventh annual Exhibition of the above Society was held in the Drill Hall, Patricroft, on the above dates, and the exhibits were remarkably good. The groups of Chrysanthemums were much superior to anything seen in the neighbourhood this season.

Taking the open section first, the plants and groups were really excellent, more particularly the first prize group, arranged for effect, by Mr. J. Horrocks, gardener to J. C. Chorlton, Esq., and which secured, in addition to the money prize, the silver medal of N.C.S. It was a credit to Mr. Horrocks. The second and third prize taken by Messrs. R. Lovell and W. Russell, both of Swinton. For six plants of Japanese and six incurved varieties Mr. E. Pollitt, gardener to J. Wynne, Esq., Eccles, was the prizewinner. For three Pompons Mr. Wm. Powell, Eccles, was placed first. The groups of miscellaneous plants did not call for particular comment, a pretty arrangement securing Mr. W. Elkin, gardener to Mrs. T. Agnew, Eccles, the first award. The second went to Mr. A. Towe, gardener to Mrs. Winterbotham, Pendleton. Mr. R. Lovell was third. Tables plants and Primulas were very moderate, but Roman Hyacinths were good, the prizes going to Messrs. J. Wilson, D. Livsey, J. Horrocks, D. Firkins, and A. Towe in the order named. Bouquets and sprays were exceptionally good, Mr. J. Mosley, Halliwell, taking honours with three bouquets and one epergne and three buttonhole flowers, the remaining one of six sprays of Chrysanthemums going to Mr. J. Wilson.

In the cut bloom classes the competition was very close indeed. For twenty-four distinct Japanese and incurved the silver cup was given by W. T. Lewis, Esq., in addition to a handsome money prize. contest resulted in the judges awarding the cup to Mr. T. Carling, gardener to Mrs. Cope, Dove Park, Woolton, for an excellent stand, the best Japanese being Etoile de Lyon (fine), Boule d'Or, Beauty of Castle-wood (superb), Lord Brooke, Mrs. Walter Cutting, and Viviand Morel. Incurved: Violet Tomlin, Empress Eugénie, John Salter, and Lady Dorothy. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was second, staging amongst others a grand Lord Alcester, which was the premier bloom in the Show. Mr. Cragg, gardener to A. Heine, Esq., Fallowfield, was third. For twenty-four miscellaneous blooms Mr. Carling was again successful, staging Colonel W. B. Smith, Beauty of Castlewood, John Salter, Empress, and Anemones, La Dieul and Annie Lowe in splendid condition. An excellent second stand was contributed by Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby; Mr. J. Roberts, gardener to H. Lightbown, Esq., Weaste Hall, being third.

For twelve incurved Mr. Cragg first, Mr. Pinnington second, and Mr. G. F. Brothcrston, gardener to Mrs. Titus Salt, Bingley, third. For twelve Japanese Mr. R. Pinnington was an easy first, staging bright coloured and fresh flowers. Mr. Brotherston was second with fine coloured flowers not fully developed, and Mr. Craggs third. For six incurved and six Japanese Mr. Cragg, Mr. Wainwright, and Mr. Pinnington took the prizes.

The amateurs classes were well filled, but space prevents a detailed report. Mr. Huber was first for six Anemones (two classes), twelve miscellaneous (three classes), whilst for twelve Japanese, twelve

incurved, and six Japanese and six incurved Messrs. J. Gibson and P. Eckersley were the successful exhibitors. For three Japanese and three incurved plants Mr. H. Huber was first. Mr. A. B. Wimpory, second; the latter winning with three plants and four Primulas. Mr. Huber also won prizes in other classes, and secured the silver medal of the N.C.S. as well as a certificate for the best incurved bloom in this section. Mr. Wm. Crawshaw scored with six Japanese and six bunches of Pompones. For six incurved, Mr. Wm. Eckersley, Little Hulton, took first honours. Mr. Jas. Smethurst, Winton, was first with eighteen blooms arranged for effect with Asparagus and Maidenhair Fern. Mr. Huber was second. The silver cup in the amateurs' section was given for twelve blooms, incurved and Japanese. This was won by Mr. Thos. Morton for a very fine stand. Mr. J. Benjamin Wroe, Patricroft, was second.

Messrs. Clibran & Sons, Altrincham, staged eight dozen cut blooms which showed to advantage. Other trade exhibitors were Messrs. Dickson and Robinson, and Dickson, Brown & Tait. Miscellaneous plants very good and choice.

GRASSENDALE AND AIGBURTH.

THE third annual Exhibition was held in the Parish Room, Grassendale, and was again a success. Owing to the great storm which was raging at the time many gardeners did not bring exhibits, but nevertheless there were sufficient to make a good display. The exhibits numbered 176, and as regards quality were far in advance of those

staged last year.

The leading feature in the Show was the class for twenty-four cut blooms, and in which four competed. As remarked in last week's issue (page 470), the prize was won for the second year in succession by Mr. Donald Forbes, gardener to A. Holt, Esq., Crofton, Aigburth, and is now his property. He also won in three other classes for cut blooms. Mr. J. Bounds, gardener to A. L. Jones, Esq., Oaklands, Aigburth, won in this group, staging, amongst others, very fine plants of Viviand Morel. A feature of the Show was the magnificent specimen plant of Etoile de Lyon, carrying over fifty choice blooms, and which was exhibited by Mr. Wm. McKevitt, gardener to H. Hornby, Esq., J.P. Orchids were splendid in quality, Mr. P. Green, gardener to L. H. Macintyre, Esq., Aigburth, being first.

The principal prizewinners in other classes were Mr. J. Bounds, for Black Alicante Grapes; Mr. J. Kelly, gardener to R. Singlehurst, Esq., fruit; Mr. J. Grant, gardener to W. S. Gladstone, Esq., cut blooms; Mr. Keightley, gardener to Major Larnor, Garston Hall Road, cut blooms, plants, and fruit; Mr. T. Ankers, cut blooms, fruit, and plants; Mr. J. Agnew, gardener to Mrs. Watts, Grassendale Park, same kind of arbibits: Mr. G. Leadbester, gardener to W. J. Davey, Esq. Holm. exhibits; Mr. G. Leadbeater, gardener to W. J. Davey, Esq., Holmleigh, plants, fruit, and cut blooms; Mr. J. Harrison, gardener to Mrs. W. G. Bateson, Elmhurst, Aigburth, cut blooms and other exhibits.

—R. P. R.

HARDY FRUIT GARDEN.

Pruning and Nailing Wall Trees .- During mild, open weather forward this work at every opportunity, commencing with Pears, Plums, and Cherries, leaving Apricots, Peaches, and Nectarines, until the spring, the latter if nailed too early being liable to be brought into flower sooner than is requisite for the welfare of the crop. All the summer pruned shoots on the branches of upright and diagonal cordons, horizontally and fan-trained trees, must now be shortened back to the plump basal buds, which will be sooner or later the fruit buds. and crowded spurs may be thinned out, also dead portions of wood, which can easily be detected as each branch is examined.

The thin disposal of the main branches must not be overlooked. This is important with most wall trees, but especially in the case of Plums and Cherries, which admit of young wood being trained in between the main branches, these growths when two years old producing fruit. A fair selection of such growths may now be nailed in, the foreright shoots stopped in summer on the main branches being shortened to form spurs, which also bear fruit. There are great advantages in this combination. The branches can be periodically renewed if any decline in vigour or die. Closely stopped Plum and Cherry treees are liable to attacks of gumming. A freer system of training mitigates this evil to some extent. In nailing make the branches and shoots secure with as few shreds as possible, not fastening too tightly, so that their natural swelling is arrested.

Morello Cherries.—The finest crops of fruit are obtained from trees that have all the best placed young wood retained and trained in to the wall or trellis. They produce fruit on the spur system of training, but not nearly so freely as by the annual replenishment of wood, cutting away the fruit bearing shoots after the crop has been gathered. The shoots then have sufficient time to ripen before the winter, when they should be neatly trained, removing the weakest and most crowded. If insects have attacked the trees during the summer, or any are present now, a washing with an effective insecticide will act beneficially.

Surface Dressing Wall Tree Borders.-One of the requirements necessary to insure the continued production of good crops of fruit from the various kinds of trees cultivated thereon is to encourage the presence and multiplication of abundance of fibrous roots near the surface. This can be done by placing good substantial food within their reach, whereby they will be attracted to it, and absorb it readily. The result is short-jointed fruitful growths which mature properly. On the result is short-jointed fruitful growths which mature properly. On the contrary, when the surface soil is never enriched, either with compost or moisture in the shape of stimulants at proper times, roots descend into the subsoil, and then their character is entirely the opposite of those prevailing in the upper layers being long, strong, and sappy, the wood growth above also partaking of the same characteristics, the inevitable result being unfruitfulness. This may not have been caused entirely by inattention to the roots, errors in the management of the branches often being the first cause of roots going wrong. It will be seen, therefore, that it is little or no use improving the surface when the roots are out of reach. In that case they must be lifted. But when not too far descended much may be done to attract some of the fibrous ones into better feeding ground.

Applying the Dressing.—This operation is often deferred until the

pruning, regulating, and cleansing of the trees have been completed, and in cases where these details require extra attention it will be well to postpone the application, thus avoiding the continual treading on the ground until those necessary matters have been completed. The first essential then following is to ascertain the whereabouts of the roots. Fork over the surface for a distance from the wall of $2\frac{1}{2}$ or 3 feet, and if roots are not found throw the loose soil conveniently out of the way. Treat the next layer of soil similarly, where roots will almost certainly be found. If ascertained to be fairly numerous do not disturb either them or the soil much, but remove that which is loose, so that the fresh material can be placed in contact with them to the depth of 2 or

3 inches.

Material for Surface Dressing. -Surface dressing being generally practised in order to recoup the energies of trees and encourage roots to the surface, the constituents of the compost must as a rule be fairly rich and substantial. As a main ingredient nothing is better than turfy loam for all kinds of fruit trees, but whether this should be further enriched by adding partially decomposed manure depends on the vigour apparent in the trees. If growing fairly strong omit it. In place of organic manure the material from a garden smother used fresh and dry mixed with the soil is beneficial. Bone meal and kainit at the rate of 4 ozs. to the square yard are good for sustaining vigour and rendering assistance in the following season when growth recommences. An application may be given now, sprinkling the mixture on the surface under the trees. Both these manures decomposing slowly, their qualities will not be appropriated by the trees until next season.

Enriching the Roots of Trees on Grass.—Old fruit trees growing on turf, if they are subject to much close stopping, will need assistance to enable them to continue healthy and in a bearing condition. Liquid manure is the best enricher for trees thus situated. In order that it may reach the lower roots it is a good plan to make holes with a crowbar at intervals of 18 inches under the spread of the branches, and to fill them repeatedly with strong liquid manure consisting of drainings from cowsheds and stables, soap suds and urine mixed. A good soaking may also be applied to the surface, preferably when the ground is moist. The holes should afterwards be filled with good loam and manure, making the mixture firm.

FRUIT FORCING.

Figs.—Earliest Trees in Pots.—To have ripe fruit at the end of April or early in May the trees, if not started, must be again dressed with an insecticide, but do not rub off the young fruit. The varieties with an insecticide, but do not rub off the young fruit. The varieties most suitable for early forcing are Early Violet, a small dark fruit; St. John's, a greenish yellow, and good Fig; White Marseilles, and Brown Turkey. Place the trees in a mild bottom heat, the pots being stood on pillars of loose brickwork, so that they will not settle with the fermenting material. The heat about the pots must not exceed 65° until the trees are fairly in growth, while the top heat may be 50° to 55° at night, and 65° by day, the trees and house being damped in the morning of fine days, and again early in the afternoon, but it must be done sufficiently early to allow of the trees getting fairly dry before night. Supply water at the roots to keep the soil moist, and always at the same temperature as the bed.

Earliest Forced Planted-out Trees.—If trees are not grown in pots for an early supply, and fruit is required ripe in May, the house should now be closed. Apply tepid water to the roots at frequent intervals to moisten the soil. Commence with a temperature of 50° at night, 55° by day, and 65° from sun heat, syringing the trees and every available surface in the morning and early afternoon, unless the weather be dull and cold, when the morning syringing only should be practised. air moderately when the weather is mild, closing the house with sun Where there is a house of early-forced trees in pots the heat at 65°.

planted out trees need not be started until the new year.

Succession Houses .- When the foliage has fallen the trees should be pruned. Shoots that have attained to the limits of the trellis may be cut back to where successional ones start, in order that they may occupy their places in the ensuing reason. Cut away entirely all elongated spurs, reserving, however, as may be desirable a few of those which are chort-jointed and fruitful. The trees after pruning should be loosened from the trellis, and after thoroughly cleansing the woodwork and glass, and limewashing the walls, wash the trees with soapy water with a brush, and afterwards with some insecticide, avoiding pigments that leave a thick deposit upon the shoots. When this is completed tie the shoots to the trellis, not too tightly. If the trees have not been lifted lightly point over the border, removing the loose soil, and apply a top-dressing about a couple of inches thick of good fibrous loam and manure. The houses can hardly be too freely ventilated, and only when frost prevails they should be closed.

Cherry House.—The pruning must now have attention. grown trees regularly stopped during growth will however require very little pruning. Any shoots that have grown considerably should be cut back to about an inch from the base of the current year's growth, and the worn out or decayed spurs ought to be removed. The terminal shoots in the case of trees not full sized must not be shortened unless the extremity of the trellis is reached, and the central shoots of young trees will require to be cut back as may be necessary to originate those for filling the space regularly. The fan mode of training is the most suitable, and is more particularly applicable to the Cherry, as it admits of replacing any branch that may fall a prey to gumming. The house should have a thorough cleansing, the trees being washed with soapy water, about 3 ounces to a gallon, and then dressed with some approved insecticide, applying it with a brush, but do not injure the buds. The house must be thoroughly ventilated until the time arrives for starting the trees, but it is better if the roof lights are off.

Vines.—Houses to Afford Grapes in May.—The Vines intended to afford ripe Grapes at the time stated must be started without delay. -The Vines intended to The outside border should have the needful protection from cold rains If fermenting materials are employed two thirds of leaves to one of stable litter afford a less violent heat but more lasting than all manure; but unless the materials can be replenished from time to time it is better to dispense with the heat. In that case the outside borders must be covered with bracken, straw or litter so as to throw off the wet. We find about 6 inches thickness of dry leaves and a little litter over them answers remarkably well. If the roots are entirely outside then it is necessary to use fermenting material. The inside border should be brought into a moist condition by applying water, and in the case of weak Vines give tepid liquid manure. Start with a night temperature of 50° in severe weather, 55° in mild weather, and 65° by day, except the weather be severe, when 50° will suffice, not exceeding these figures until the growth commences. Maintain a moist atmosphere by spring until the growth commences. Maintain a moist atmosphere by syringing occasionally, but excessive moisture excites the emission of aërial roots from the rods. Depress the rods of young Vines to the horizontal line or below to ensure the regular breaking of the buds.

Houses Started Early in November. — Whether the Vines are in pots or are planted in borders the temperature will need to be increased to 60° at night in mild weather, 58° in severe weather after the buds break and gradually increasing so as to have it 60° had a reducible increasing so a so to have it 60° had a reducible increasing so a reducible increasing so

the buds break, and gradually increasing so as to have it 60° by day in severe weather, and 70° to 75° in mild weather with moderate ventila-Tie the Vines in position as soon as growth has well commenced, and before the shoots are so long as to be damaged in the process. Sprinkle the paths in the house two or three times a day in clear weather, but avoiding a very moist or dry atmosphere. Disbudding should not be practised until the fruit shows in the points of the shoots.

Midseason Houses.—When the Grapes have been cut the Vines should be pruned. It is decidedly advantageous to do this work directly the leaves have fallen, the Grapes having been cut with the requisite amount of wood and placed in bottles of clear rain water. Early pruning is the best safeguard against bleeding, and the Vines enjoy a longer season of rest. The Vines will in all probability give sufficiently large bunches if pruned to one or at most two eyes. If larger bunches are wanted, or the Vines from weakness do not afford bunches so large as desired, leave more growth, only select sound, round fully developed buds on firm well ripened wood. If the roots are in firm soil and favourable for rooting then the wood will be stout and short-jointed, and the buds at their base will be round, plump, and well matured. Let the Vines be dressed, the house thoroughly cleaned, and everything put into order, so that there need be no hurry to put things straight.

Keep the temperature as cool as possible so as to insure complete rest.

Late Houses.—Every precaution should be taken against damp.

The most prolific cause of Grapes not hanging well is bad construction of the houses, water hanging in the laps of the glass and blown over the Grapes. Remove all leaves as they become decayed, and afford only sufficient fire heat to expel damp and to exclude frost, keeping at 40° to 45°. Close the house in wet most here. Close the house in wet weather, and seek to insure a dry, cool,

and equable temperature.

APIARIAN NOTES.

PRACTICAL HINTS.

ALL our queens are youthful and the bees quite strong enough for the stocks to stand any protracted winter we are likely to experi-Although the stocks were left ample food for the winter much late breeding reduces it and necessitates feeding with 3 or 4 lbs. of syrup to each hive. All sugars are not alike in quality, nor in the proportion of water required. I place some sugar in the vessel in which it is to be dissolved, then pour cold water on it sufficient to cover the sugar 2 inches for every 7 lbs. of sugar.

For various and obvious reasons I have discarded all top-feeding, unless in a few cases of nuclei. The bees will, at times, carry up syrup when they will not touch it if above. When feeding from below all uncovering and covering hives and the cooling of them are avoided. When the hives are warm and cosy keep them so, and do not cool them by uncovering. The simplest and best feeder I use is a fountain having a neck or thimble into which a cork is fitted having a hole through the centre. Into this I put a saw handle screw, broad end up, which acts as a valve to shut or open when the lower end touches or leaves the trough. When filling draw the cork, and when full replace inverted; insert the neck into the hole and let it rest on stage or platform, which should be of such a height as to allow the thimble or neck to be oneeighth of an inch lower than the upper edge of the trough, which is three-eighths deep and covered with wide mesh wire cloth to keep the bees clean and out of the feeder. Wire cloth is much to be preferred to perforated metals or floats, the latter preventing the bees getting beneath it, and when refilling being killed.

Hives having ventilating floors require no attention, but already hives will have absorbed a considerable amount of dampness fatal to bees during the winter. These damp boards should be removed and dried, or a dry one substituted. The absence of damp in any hives during the winter is the reason disease is never present, and at no time are many dead bees to be seen. My hives arranged, prepared, and the bees fed as directed, having not more than 1 inch entrances unless on a chance fine day, when the bees are airing, they will be widened in the morning and contracted at dusk. They will require no more attention till the May flowers are profuse and hives increased in strength.—A LANARKSHIRE BEE-

KEEPER.

BEES IN YORKSHIRE.

AT the meeting of the Wakefield Paxton Society held on the 18th inst. Mr. J. Eastwood read a paper on "Bee-keeping." The essayist remarked that bee-keeping was a hobby that yielded profit, pleasure, and instruction. It would be well if every labourer were the fortunate possessor of a hive. Watching these industrious insects accumulating a store for a rainy day would, he thought, suggest thrift to the owner. After speaking of the important work of bees in hybridisation, Mr. Eastwood said he believed bees had increased the yield of his Strawberry crop one quarter. A neighbour of his had gathered 40 stones of honey this season, which, at 1s. per 1b., was worth £28. In Scotland he had heard that 7 cwt. had been yielded by six hives. A man in Westmoreland had eighty hives, and realised 50s. from each, or £200. It was important to catch the honey flow, by shifting hives into the vicinity of Clover and Bean fields, by which astonishing results were secured. The method of managing skep hives and bar-frame hives was clearly explained, and also the securing of swarms and the driving of bees in order to take the produce without destroying them. Many interesting and amusing narratives of his experiences in bee-keeping were related by Mr. Eastwood, who, in conclusion, said that with successful management and fairly good seasons everyone might follow this hobby of beekeeping with great satisfaction and profit.

•All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (R. P.).—We have had another inquiry of the same purport as yours, and to which a reply has been sent by post.

Book on Grafting (A. Shandbrook).—Baltet's work, published at 37, Southampton Street, will afford you the desired information.

Carnations (J. Hughes).—The flowers to hand are apparently as good as Mrs. Leopold de Rothschild Carnation in general appearance, so far as we can remember of the latter variety. Comparison, however, is necessary to decide definitely on that point. The variety is well worth preserving.

White Viviand Morel Chrysanthemum (Walter Barnes).— We have seen similar examples to yours of two white blooms and one deep pink one on the same plant, each bloom having developed from a terminal bud.

Parsnips (T. W. 1.).—We have no doubt about 1 and 2 being identical in variety, and we should not like to say they have not both been grown in the same bed. No. 3 may have been so grown also from the same packet of seed, seminal variations of the nature displayed in the samples not being in the least uncommon. It is impossible to judge positively on all the roots being grown together because the soil particles have been washed from two of them, but there is nothing to indicate their being grown in different soils.

Pear Bergamotte Hertrich (Amateur). — You wish to know whether this Pear "is worth growing, and would like to see an illustration of it." It is a delicious Pear, usually ripe at Christmas, and will keep till May. The following description of the Bergamotte Hertrich Pear is taken from the "Fruit Manual"—"Fruit rather below medium size, 2 inches high, and $2\frac{1}{2}$ inches wide; Bergamot-shaped, inclining to roundish turbinate, even in its outline, except at the stalk, where it is furrowed. Skin very much covered with ashy grey russet, through which the grass green ground is visible; on the side next the sun there is a brownish tinge, and there is a patch of pale brown russet surrounding the stalk and the eye. Eye with narrow incurved segments set in a shallow and furrowed basin. Stalk three-quarters of an inch long,

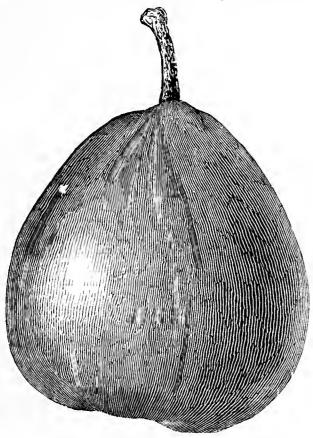

FIG. 72.—PEAR BERGAMOTTE HERTRICH.

inserted in a narrow cavity. Flesh yellowish, with a greenish tinge under the skin, melting and juicy, with a rich flavour and fine aroma, somewhat resembling the Swan's Egg." When grown under favourable circumstances this Pear usually produces a good crop of fruit.

Cucumber and Tomato Roots Infested with Eelworms (F. A. B.).—The small fragments of roots are infested with eelworms, for the most part dead, through the drying of the roots in transit. The mite which is associated with eelworm attack in Cucumbers was also dead. Nevertheless, we found some live eelworms both on the Tomato and Cucumber roots, and these having left the cysts were feeding on the roots destitute of nodules, and would have spread upwards until they killed the plants. Soot water did not destroy the eelworms, the active creatures seem to enjoy it, though it is far more beneficial to the plants than many manures that are employed. The only accepted remedy is to destroy the plants, clear out the old soil, and start again with fresh plants and soil. The discase has been established on the plants several weeks or months.

Manure for Tomatoes (Enquirer).—You ask, "What is the best artificial manure for Tomatoes in the open ground?" No one can answer the question without knowing what any particular soil contains and what it lacks in the way of essential elements for the growth of Tomatoes. A simple mixture of two parts bonemeal and one part kainit is generally good, applied early in the spring at the rate of 2 ozs. to 3 ozs. per square yard, according to the state of the soil. A supplementary dressing of nitrate of soda of less than an ounce to the square yard when the plants are growing will have a stimulating effect, but this is most needed after the fruits set, as the over-excitement of the plants in their early stages favours soft tissues and their vulnerability to disease.

Names of Fruits.—Notice.—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is

wholly irregular, and we trust that nonc of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (G. J. M., Nottingham.).—Winter Greening. (R. G. L. B.).—5, Beurré Bosc. 6, Knight's Monarch. 9, Minchall Crab. 10, Beauty of Kent. (W. Seal).—1, Rymer; 3. Scarlet Pearmain; 4, Beauty of Hants; 5, Aromatic Russet; 6, Uvedale's St. Germain. (T. S. N. P.).—5, Easter Beurré; 6, Hacon's Incomparable; 7, Calabasse; 8, Marie Louise; 9, Golden Noble. (T. N. R.).—We are sorry we cannot name any of your fruit. The Apples are —We are sorry we cannot name any of your fruit. The Apples are evidently local, and the Pears are imperfect. (C. E. M.).—1, Greenup's Pippin; 3, Peasgood's Nonesuch; 4, American Mother; 5, Golden Pearmain; 6, Lord Derby.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (W. E. T.).—The flowers you sent are distinctly florists' varieties, and which, as you will see by our conditions, we do not undertake to name. A grower of a large number of plants might possibly name the varieties on comparing them with others in his collection. (H. B.).—Dracæna indivisa. (L. M. H.).—1, Ficus repens; 2, Adiantum cuneatum. (Amateur).—1, Aralia Veitchi; 2, Bertolonia guttata; 3, Asparagus deflexus.

PROFITABLE LIVE STOCK.

HOPEFULLY do we write about the possible improvement of stock, because it is so obviously in the interest of farmers that we are working. It is for them to consider ways and means, to proceed with caution—yet by all means to proceed to bring about a reform; to shake off the heedless, aimless, buying and breeding of inferior animals; to give full recognition to the value of stock upon which some profit is always possible, by having only such stock upon their hands.

Given then of such high class animals, dairy cows whose annual milk average is well up to the 700 gallons which we know to be so entirely possible, there must also be sound practice in feeding and housing them. The difficulty here is in the conception of what sound practice really is. We may define it as a combination of gentle kindly treatment, with wholesome nutritious food, thorough shelter, and cleanliness. Brutality, and the hurried driving of cows, has spoiled many a batch of cheese and butter, as well as checked the flow of milk. It is a well-known fact that when cows, frantic from attacks of gadflies, rush about pasture for hours, the milk yield falls off very much; it is also known that when cows are driven to the milking hurriedly, or are knocked about in the cow house, the quick souring of the milk shows how much it has been injured. Avoid extremes in feeding; nothing can be worse than the state of semi-starvation in which cows are so frequently kept during the dry or non-milking period, which on cheese farms often extends for three or four months. The fact that cows require more rather than less nourishment during gestation is apparently ignored; they are kept out on pasture to clear off the fog which really affords very little nourishment, in addition to which a scanty bite of hay is thrown out to them on the pasture. They must always be hungry; they fall off woefully in condition; can we wonder that the calves are weakly, and enfeebled from the emaciated dams? It is ridiculous to talk to the brutal, foolish owners of such cows about selection, breeding, or any detail of management. They positively court failure, and then cry to Jupiter, in the guise of their landlord, for aid in the form of rent reduction!

It is the landlord who is to be pitied, and not the tenant in such a case. To those who have so mismanaged their cows in pure ignorance and thoughtlessness, and who would do better if they knew how, we say, Keep up condition in your cows, and economise food in winter by the provision of thorough shelter. The poor animals ask you for it plainly enough, by seeking such shelter as can be had from tree clumps or hedgerows when they are left out at night. Even that is better than some hovels known to us. So many of them are too narrow, more are so badly constructed as to be almost useless. For all open hovels— $i\ e.$, having the side-facing a yard open, the correct width is 18 feet, for close hovels 15 feet is sufficient. We know, a long hovel at a certain midland dairy farm, which has a brick side and ends, the other side having faggots set on ends. They do not reach to the eaves, and as there is an open space between the top of the wall and the eaves on the other side, the hovel is draughty and cold. This is bad enough, but as the whole of the land is in pasture there is no straw, the cows lie upon the bare floor, which would not matter if it were dry and clean, but it is worn into holes, filth is suffered to accumulate upon it, so that at turning out time in the spring the cows are in a disgustingly filthy condition. It is impossible that the milk can come from such a building, or animals so dirty, untainted. There is often

trouble of another kind with winter milk, which goes straight from the cowhouse to the separator, and that is the clogging of the separator by foreign matter in the milk. It is patent to everyone that when the milker comes to milk cows with their coats full of dry filth, into which he butts his head during the milking the friction causes much "foreign matter" to fall into the pail, to which dirty hands often contribute. The fact is not pleasant to write about, but there can be no doubt that cleanliness of the cow itself, of its food, and of its surroundings, has not a tithe of the attention it ought to have. We would have the curry comb and brush in daily use among cows during winter just as much as for horses, the cowhouse should rival the stable in keeping, the cowman be as clean as his milk pails—all matters of detail worthy of our best attention.

WORK ON THE HOME FARM.

Are the roots all in clamp or heaps yet? If not, all large roots may now be spoiled by a cold snap of very brief duration. Since writing our last notes we have seen a field of fine Swedes on the borders of Yorkshire being pulled and trimmed while it was freezing sharply, with This was not good management, nor was the occasional snowstorms. apparent waste of the Swede tops this season in the eyes of a southern farmer. For a month or more the fresh green growth upon them which come so freely in the moist warm autumn has been in use for the cows, and though to eke out the tops as long as possible the clearance of roots

was prolonged, it was got through in time to be safe from severe frost.

As active work on the land is brought to a close till spring go carefully over all implements, have necessary repairs done at once, and let the whole of them be well cleaned and painted before being put away. Any that are worn out or useless should be got rid of; there is no more objectionable sight about a homestead than old implements mouldering and rusty, unless it be useful implements left about in the open just as if they were worthless. It is a good rule to have them brought in and housed at once, and we like them to be painted afresh every year. Everything about the homestead should now be especially neat, trim, Suffer no accumulation of and in good order. Look well to drains. water in yards. See that there is scrupulous cleanliness in stable, cowhouse, and poultry houses, also that all are free from draughts. There is nothing better for such buildings than roof louvres with three or four openings, as then ventilation is assured. Poultry houses especially must be snug and warm now if we would have winter eggs. have often found harm caused in them by cold cutting winds entering along the eaves right upon the fowls on the perches. Now is the time to guage the egg supply and to ascertain if any alteration or improvement is possible or is required in view of doing better another winter. The matter is simply one of timely pullet selection in sufficient numbers to afford a full supply, no light matter for a large household, but just one of those things which denote good management.

EXTRAORDINARY WEIGHT OF SWEDES. - Messrs. Webb & Sons inform us that their stands at the Birmingham and London Cattle Shows include some extraordinary specimens of Webbs' Imperial Swede grown by Mr. W. Maxwell, Sparnel Bank, Galston; 124 of these roots, which have been photographed, scaled the enormous weight of 1 ton 2 lbs., or an average of over 18 lbs. each. Messrs. Webb believe that this return beats all record, and the weight has been attested by reliable witnesses.

REMARKS.

19th.—Snowing till about 5 A.M., occasional flakes in morning, and also with spots of rain in afternoon, and a heavy shower between 6 and 7 P.M. Violent squalls of

rain in afternoon, and a heavy shower between 6 and 7 P.M. Violent squalls of wind throughout.

20th.—Bright sun at times in morning; overcast after, with spots of rain.

21st.—Bright sunshine almost all morning; generally overcast in afternoon.

22nd.—Bright sunshine generally, but overcast at times, and a squall of rain and wind at 3 P.M.; brilliant night.

23rd.—Almost cloudless till 1 P.M.; generally overcast from 2.30 P.M. to 4 P.M., but clear again after, and brilliant night.

24th.—Generally overcast, but occasional sunshine in afternoon; very slight showers about 9.30 A.M. and 3.30 P M.

25th.—Fine, with frequent sun in morning; overcast afternoon with occasional drizzle; steady rain from 7 P.M.

Temperature rather below the average, but by no means exceptionally so.—G. J. SYMONS.

TE always expect to hear of a number of complaints about errors in judging during and at the close of the Chrysanthemum season. Far more complaints have been sent to us this year than could possibly be published, even if they had possessed more than local interest, which the majority did not. Moreover, some of them were evidently of a personal character, as emanations from exhibitors who were surprised and annoyed by the verdicts recorded, or from their friends who were doubtless honestly convinced that the judges were wrong in their decisions. Most of the complaints were of a general character, no definite or tangible evidence being forthcoming in support of the opinions expressed, and in more than one instance the remarks contravening the justice of the awards were founded on an inspection of the exhibits on the second day, or twenty-four hours or more after the judging was completed. Also we have had the verdicts that were recorded it may be presumed, by experienced men, overturned with the greatest ease by self-appointed censors, who, however competent have not yet been chosen by societies to officiate at important shows. It could not be supposed that the public would be greatly interested in narratives of what may be termed second-hand judging under the circumstances indicated, and possibly the narrators of the alleged delinquencies, in some cases at least, were glad rather than otherwise that their criticisms were not published.

We do not imply that in all the instances which have been brought to our notice of alleged errors that the official adjudicators were of necessity right in every case, and that their censors had nothing whatever to complain about. That is not the question. The point is this. In nine out of ten complaints of the verdicts at shows the matter as it is presented simply amounts to a divergence of opinion between officially appointed adjudicators and self-constituted revisers, the latter frequently condemning the former for not judging by points; while the complainants fail to send figures of their own as affording evidence that they have themselves tested the accuracy of the awards carefully and systematically. In some cases we know they have not. Conclusions have often been arrived at in five minutes quite opposite to those of the adjudicators, who after infinite pains have estimated the value of every bloom, and recorded the results in their pocketbooks. It is desirable when allegations are made of the negligence or incapacity of judges that evidence should be submitted to show that protests are well founded, or at least presented in a manner in which their value can be tested. They should then receive the attention of officials, and if transmitted in temperate language, as all protests should be, are not likely to be ignored by the Press, as accuracy in the awards at exhibitions is a matter of great public importance.

A case to hand, and a very remarkable one it seems to be, enables us to show that the Journal of Horticulture will not deny publicity to a clearly presented instance of alleged errors in apportioning prizes at shows. If the writer of the following letter has made no mistake, we have a case of judging the judges, such as is altogether uncommon, and a verdict of guilty of incapacity entered against them by the secretary of the society as authorised by its committee of management. After approving generally of the remarks of "Secretary," on page 469 last week, our correspondent proceeds as follows:—

Perhaps you will permit me to give an instance of misjudgment, which you will agree must be hard for certain exhibitors to bear. In a

northern show a silver cup, valued at £20, given by the city, was offered as a first prize for forty-eight blooms of Japanese Chrysanthemums in at least thirty-six varieties. After the awards were allotted to the different stands, two of the competitors handed in a written protest to the Secretary of the Show against what they considered misjudgment. The Committee so far entertained the protest as to appoint a competent expert to "point" the different stands, and he gave his verdict as below:—

First prize collection 150 points. Second , , 126 ,, Third ,, ,, 159 ,, Fourth ,, 157 ,,

The Secretary afterwards told the "protesters" that the Committee acknowledged the misjudgment, but owing to a clause in the rules—namely, "The decision of the Judges is final," nothing could be done in the matter. When such cases as these happen is it not a duty to bring them before the public? And if societies will have such a decisive rule in their schedules, ought not they to make sure that the judges appointed are competent men in whom competitors can repose confidence? I consider one of the most important matters, as affecting the success of any society, rests in the ability and integrity of its judges. I would also suggest that the Judges wherever the contest is close be asked to hand to the Secretary the number of "points" recorded for the different entries, and not to be satisfied with verdicts arrived at from a bird's-eye view of the exhibits.

It will be conceded that the case, as it stands, is a remarkable one. Our correspondent sends us his name and address, and is evidently convinced of the accuracy of his statements. the officials of the Show have a different version of the case to place before the public remains to be seen. Our pages are open to any counter statement or explanation, and if neither is forthcoming the public will naturally conclude that the above record is substantially correct. What does it mean? It means undoubtedly that the Judges are found guilty of incompetence; but that is not all, for the Committee in condemning the Judges condemn themselves, as they are responsible for the appointment of adjudicators and the justice of their awards. The existence of the rule, behind which it is said they (the Committee) have sought shelter, is, in effect, a declaration that the Judges are so competent that they are empowered to act for the Committee on a determinate point. They are, in fact, delegates of the Committee, entrusted with carrying out its object of doing justice to "The decision of the Judges shall be final," means that it is the decision of the Committee recorded by men they have appointed for that definite purpose. If committees are not satisfied with the work of their judges, they can there and then supersede them and appoint others, the verdicts of the former being declared null and void if this is done, and the prize cards withdrawn before the public are admitted to a show. If the awards are "published," as they are when disclosed to the public at the appointed time for admittance, then we think those to whom the prizes have been awarded can claim them, even if the judgments are wrong; but there is no claim on the judges, but only on the committee, and the members of a committee are personally and severally responsible to exhibitors for errors committed by their delegates. This, we believe, represents both the law and equity of the whole matter.

In the extraordinary case in question the Committee is said to have appointed a "competent expert" to point the blooms, and it is implied that his figures were accepted as correct. He, therefore, was the final judge. But what about the judges first appointed? Were they not competent experts? It seems to be admitted by the Secretary they were not. Why, then, were they appointed? If the figures above published are those which the Committee accepted as correct when admitting the misjudgment, then indeed is injustice done to two exhibitors, for we have this strange anomaly:—

A, Third prize with 159 points. B, Fourth ,, ,, 157 ,, C, First ,, ,, 150 ,, D, Second ,, ,, 126 ,,

This anomaly is only explainable by remembering that the positions of the competitors were determined by the appointed

judges, while the pointing is the work of the revising "expert!" Was not he the final judge appointed by the Committee? It would seem as if the proceedings had ended in an imbroglio as peculiar as it is rare.

It is undoubtedly a matter of paramount importance that judges of proved competence should be secured, and so much are committees of societies whose shows have achieved almost worldwide fame alive to the fact that they choose and secure the judges nearly a year in advance, and already men are booked for several shows to be held next November.

No experienced judges would have the least objection to handing to the secretary the number of points recorded. Why should they? This is in fact often done, but a secretary would not be likely to disclose the points to exhibitors as soon as the work was completed—at least not more than once, as a dozen or score of persons, competent and otherwise, would soon be testing them and disputing over them in a manner that would not add to the comfort, or increase the freedom of movement of visitors to the exhibition. We suspect there are not many judges of repute who would hasten to accept invitations from committees who would repudiate their verdict on the authority of an "expert." Should not this supervisor be the sole judge next year? The Committee referred to by our correspondent have only themselves to blame for the not very enviable position they are in through pronouncing their own appointed judges guilty of incompetence, yet feeling bound to accept their verdicts, though founded on "acknowledged misjudgment." The case should be historical.

ST. BRIGID'S ANEMONES.

(ANEMONE CORONARIA SEMI-PLENA.)

I HAVE been frequently asked by many people as to the origin and history of these now highly popular garden flowers, and so I have briefly set down all I know about them for the information of your readers, and all interested in Anemones and their culture. They came into notice about twenty years ago; one of the first to appreciate and cultivate them outside the garden of the lady who founded the strain, and initiated the best system or method of culture, being the late Dr. David Moore of the Royal Botanical Gardens at Glasnevin, near Dublin. It was at Glasnevin that I first saw a bed of these splendid seedling flowers blooming profusely in October or November some twelve or thirteen years ago. I had never seen such a sight in my life, and Mr. Thos. Smith of Newry, who is no novice in the world of flowers, who also saw them with me, said at once that the germ of a new idea lay in the fact that these splendid blossoms could be so easily and readily grown as annuals from carefully selected seeds sown every spring.

On November the 4th, 1881, I think it was, I had the honour of a visit from the lady whose nom de plume of St. Brigid is now so intimately associated with these flowers. It was a dull, foggy, November day, with roads aslush, and things generally seemed inimical to "the flowers that bloom in the spring;" but on entering inimical to "the flowers that bloom in the spring;" but on entering my room the owner unfolded from a parcel in her hand some of the brightest and most charming Anemone blooms I ever saw even in April or May. Chrysanthemum flowers looked absolutely pale and dull and lifeless beside them, and life seemed brighter and more enjoyable for their sunny presence in the smoky town. Of course I made all kinds of inquiries, and found out their history as far as it could be known; but I subsequently discovered that the Editor of the Journal of Horticulture had been long before me in admiring these flowers, and in stamping them with his imprimatur. On turning over a file of this paper I find a short article on "Anemones and their Culture," by "L. L.," in the number for April 15th, 1875, and as this is the very first published allusion to these flowers, and really contains the germ of all that has since been written or said of them, I may be excused for quoting it bere.

"When I look at the lovely beds of semi-double Anemones now in blossom in my garden, the intensest brilliance side by side with the softest harmony of colour, I think how much those lovers of spring flowers miss who do not treat these beautiful blossoms with somewhat more care than is usual. Besides their beauty of form and exceeding richness and variety of tint, which I scarcely dare to dwell on lest it should seem exaggerated, the Anemones possess the great charm of producing blossoms all through the dark days of winter, to which their brightness forms such a cheering contrast. The bed I now speak of has supplied me with continuous bouquets from last October up to the present day,

the size of the flowers of course increasing with the advance of spring, which is the meridian season of their beauty; but if there is a midwinter open-air bouquet more charming than a flat vase filled with scarlet Anemones along with blossoms of the large Christmas Rose white

as a snowdrift, I can only say I have never seen it.

"Observing so many spring flowers praised in your Journal I have often wished to say a word for the Anemones, but the old saying "No Irish need apply," has hitherto deterred me. However, last week having shown my flowers to several florists, their hearty exclamation that they had never before seen such beautiful Anemones, tempts me now to give my mode of treating them, in the hope that others may have equal

enjoyment in their blossoming.

"Having saved the seed the preceding May, in March or in April I select a piece of good ground in a warm situation. I have it well dug and made fine, and then over the surface I have spread a layer of fresh cow droppings collected from the pasture; this is dug in from 5 to 6 inches deep, and then some well-decayed leaf mould is mixed with the upper 2 inches of the bed; it is raked fine, and all is ready for sowing. I then take the seed and mix it with my fingers in some sand that has a little moisture—just enough to make it adhere to the seeds, and thus separate them. I next sprinkle the seed thus prepared over the bed, not too thickly; and having ready some fine mould, I with the hand shake enough over the bed to cover the seeds, but not bury them.

"Whenever weeds appear they should be pulled up while they are yet so small that their removal will not disturb the Anemone seedlings, which are tardy in appearing and slow in their first growth; but by August they should be sending up flower-stems, a few only at first, but increasing every week, until by the end of October the bed is well filled with blossoms, to continue so all winter until spring adds fresh vigour to its splendour. I enclose some blossoms pulled to-day, so that they may speak for themselves.—L. L."

We never saw more beautiful specimens of the semi-double Anemone.—EDS.]

The paragraph on their culture from seed is especially valuable and practical, and it but very rarely happens that so few words have ever proved so rich in beautiful results to all who have followed them out to the letter in their gardens. Of course I do not mean to imply that "St. Brigid" actually inaugurated or originated the rearing of Anemones from seed. That had been done by all the early English florists from the days of Gerard and Parkinson to the days of Hogg and Tyso, but what "St. Brigid" really did was to revive this good old practice, and to start a renaissance as it were in seedling Anemone culture, in place of planting the dried and comparatively worthless roots at too late a season in the year.

Now, some people have asked what are "St. Brigid's Anenes?" Well, they are simply carefully selected seedlings from the common A. coronaria as so largely grown in Brittany and in Normandy, near Caen and elsewhere. But then the seed was carefully selected for years from the finest and brightest blooms only, all weedy forms and bad colours being ruthlessly torn up and cast out on the first opening of their flowers, to prevent their pollen infecting the finer kinds. By a systematic course of culture from seed aided by selection of this kind "St. Brigid" actually developed from the so-called French or Crown Anemone a new and vigorous

race, hence the name so appropriately bestowed upon them.

But why does "L. L." call herself "St. Brigid?" someone is sure to ask, indeed the question has been asked hundreds of times already. To make a long story a short one, I may say that the lady owns an estate in County Kildare (cill = church, dare = Oak tree), where in bygone days St. Brigid, the Patroness Saint of Ireland in the days of St. Patrick, founded a nunnery and oratory under a spreading Oak tree, just as the old monks at Fountain's Abbey sheltered under the spreading Yew trees there existing while they reared the first walls of their celebrated abbey. It was in a quaint old garden near the site of St. Brigid's Church or Oratory that Mrs. L. Lawrenson first grew the Anemones in the way described, and from thence she sent the flowers which drew forth your editorial commendation at the end of her article, reprinted above. But something else had happened soon after sending you the letter and the flowers. Your comments had excited the interest of a wide circle of readers twenty years ago, just as they do to-day, and so letters by the dozen reached "L. L." through your office and in other ways, asking for roots or for seeds, or for advice of one sort or another as to the rearing and after management of these flowers. To avoid as far as possible any further personal publicity, the oseudonym of "St. Brigid" taken merely as an additional safeguard, and it has proved to be a tolerably efficient one, though no one can really "hide a light under a bushel," and so Mrs. Lawrenson has found that in spite of her desire for privacy her flowers have forced a sort of floral fame upon her whether she would or no.

But it is not merely Anemones that have occupied all "St. Brigid's "cultural care, for she has many very fine seedling Narcissi and a splendid new series of seedling varieties of Christmas Roses or Helleborus niger, mostly seedlings from the large pure white

variety which bears her name, crossed with pollen of H. maximus, and others of the best kinds. But after all the rich variety, the vigour of growth, the brilliancy of colouring, and the perpetual flowering habit of "St. Brigid's" race of Anemones will long serve to perpetuate her contribution of loving labour to our gardens, and so to the greater happiness and contentment of our lives, for has not her fair hand enriched the earth, and made its fruits more fair than they were before?—F. W. Burbidge.

[Well do we remember those brilliant and beautiful flowers sent nearly twenty years ago — flowers that will not fade from the memory, and glad are we to know that the sender of them still engages in the work she loves, in "the quaint old garden" in Co. Kildare.]

LÆLIA ANCEPS AMESIANA.

At the meeting of the Royal Horticultural Society, on November 30th, T. Statter, Esq., Stand Hall, Manchester, exhibited a plant of Lælia anceps Amesiana, and for which a first-class certificate was awarded. It is obviously a very fine form. The sepals and petals are white, tinted rosy purple at the tips and base. The lip is medium sized, but of deep purplish crimson, and the throat is richly veined. Fig. 73 represents this beautiful Orchid.

CATTLEYA CITRINA.

I have understood that in order to grow Cattleya citrina successfully the plant should be so placed that the apices of the pseudo-bulbs point downwards, and I do not remember to have seen a plant in any other position until to-day (November 30th), when I received three plants from a noted firm for Orchids placed upright in pans with peat fibre and sphagnum, but evidently potted very recently. This circumstance reminds me of having read in the Journal a year or more since that (according to the correspondent's view) the downward position is unnecessary. I shall feel much obliged if Orchid growers will kindly give their opinions on this point.—C.

ORCHIDS FOR FLOWERING AT CHRISTMAS. (Concluded from page 487.)

THOUGH less durable, yet for beauty and softness of tints in the lightly poised flowers, the Calanthes of the vestita group are admirable for flowering in December and January, their long scapes adapting them for arranging with other plants, such as Ferns and small Palms. Calanthes require very liberal treatment to insure their success, and though it is too late now to correct any errors of the past season, we may give a hint or two for present guidance, and to provide for better results another year. If well grown the pseudo-bulbs should be now plump and mature, the foliage turning yellow as its work is performed. The supply of water should be gradually decreased, and the only care needed is to watch the scapes closely as they expand to avoid any injury to them, and to give just sufficient water to keep them steadily advancing; but it will not be necessary to saturate the soil frequently unless the leaves are still fresh and active. This must be followed up while the plants are in flower, then allow them to become quite dry for a few weeks, repotting in succession early in January or February, according to convenience. Remove old roots and place the plants in a compost of equal parts good fibrous loam and peat, with a little old manure and sand. Then allot them a light position in a stove, Cucumber house, or any similar house where a fairly high temperature is maintained with abundance of moisture, the roots supplies to be increased as the growth advances, and frequent syringings. The varieties of Calanthe vestita are numerous, differing in the size and colouring of the flowers, rubrooculata having a deep red centre, being an effective form. C. vestita Turneri and Regnieri are useful as flowering some weeks later than the ordinary varieties of C. vestita, thus extending into January and February in natural succession.

That most useful winter-flowering Orchid, Calanthe Veitchi, merits a special paragraph, for though it naturally flowers, under the same treatment as C. vestita, in November, yet with a succession of plants potted and started at intervals of a week it is possible to have some in flower over Christmas, or until the later forms of the C. vestita group are attractive. Those in flower now may be kept in good condition for some time if they are placed in as cool a house as is safe, and water is not allowed to settle on their flowers;

while those showing spikes may be retarded if care is exercised to avoid sudden check, a warm conservatory being a suitable position. With liberal culture this Orchid makes wonderfully strong pseudobulbs, and if these are properly matured fine spikes are to be expected, and when these can be secured 4 feet in length there is every reason for satisfaction. Few hybrid Orchids have obtained a popularity approaching Calanthe Veitchi, which has also without a doubt been more extensively increased by propagation in the thirty-seven years of its existence than any Orchid introduced within that period. It was one of the late Mr. Dominy's early successes; but it is not generally known that this hybridiser also raised the white variety, which has been since obtained by several amateurs in recent times, and if memory serves correctly, Mr. Dominy once told us that it was from the same sowing of seed, but was sold before it flowered, being supposed to be the same as the ordinary type. The cross was effected between Calanthe vestita and Limatodes (now known as Calanthe) rosea, the flowers

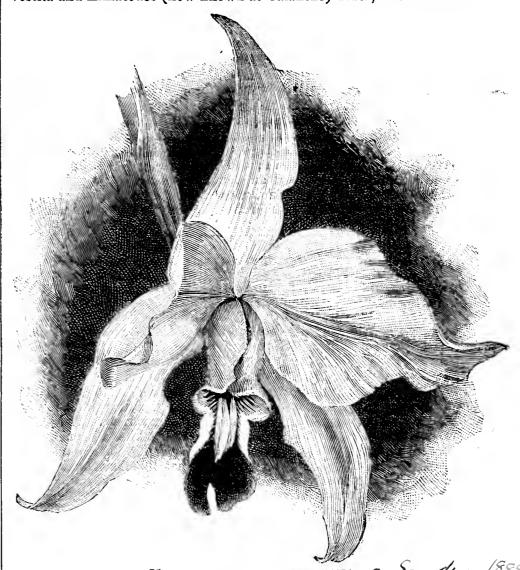

FIG. 73.—LÆLIA ANCEPS AMESIANA.

showing an interesting combination of characters, with the rich rosy crimson colour of the Limatodes rather improved, and the vigorous floriferous habit which characterises so many hybrids.

One of the most delightful little Orchids for December flowering is that known popularly as "Indian Crocus," botanically as Cælogyne præcox, and more familiarly in gardens as Pleione præcox. We have a trio of beautiful miniature plants in Pleione lagenaria which can be had in November, P. præcox for December, and P. humilis for January flowering. That first mentioned in this paragraph will shortly be showing its rosy purple flowers, and is better in a cool position where moisture is not too abundant, either in a conservatory, warm greenhouse, cool house, or any other convenient place if the temperature can be prevented falling below 45°, giving only sufficient water to keep the flowers fresh, and sphagnum also with which the surface of the soil should be covered. As these little plants flower without leaves, a few small Ferns dotted amongst them look well and also afford a means of testing if the supply of water is right. Shortly after flowering they can be repotted, placing them in shallow pans, using a compost of one-half peat, one-fourth loam, and one-fourth sphagnum, sand, and old manure. A place on a shelf in a warm house can then be found for them, watering them freely when growth is advancing vigorously.

Angræcum eburneum is rather too large a plant for small collections, but it has a very telling appearance when bearing its tall

racemes of flowers, the green sepals and petals being contrasted with the broad, heart-shaped white lip. It needs a warm house, and abundance of water during growth.

Amongst Orchids that usually flower in October or November, but which can frequently be prolonged to a later period, the following may be named—Dendrobiums bigibbum and superbiens; Odontoglossums bictoniense, gloriosum, and Insleayi; Cattleyas Bowringiana and luteola; Lælias autumnalis, Perrini, and peduncularis; Angræcum Scottianum, Barkeri, Skinneri, and Pholidota imbricata. Of those flowering in January and February, but which may be occasionally had earlier, we can note Dendrobium aureum, crassinode, Devonianum, and primulinum; Lælias elegans and superbiens; Phalænopsis Schilleriana, amabilis, and grandiflora; Pilumna fragrans; Maxillaria aromatica; Odontoglossums constrictum, maculatum, pulchellum, and Edwardi; Oncidium varicosum, and ornithorhyncum.

In the third list—those which flower continuously or at different seasons—we have Cypripedium Edeni; Odontoglossums grande, crispum, and Rossi majus; Oncidiums Forbesi and flexuosum, usually autumn flowers; several of the Masdevallias, Vanda suavis, and numbers of others which cannot be enumerated here. It will be seen, however, from the foregoing that there need be no lack of Orchid flowers at Christmas as far as regards the plants that can be selected to produce them at that period. If through mismanagement or the unavoidable fogs the plants fail to satisfy us, we have to take heart, try again, and hope for a better future. In some seasons we have had an Orchid display that would be considered satisfactory at a much more favourable time of the year, and then we have had the reward for all disappointments.-ORCHIDIST.

SELF-FERTILISING PEARS.

"ACCORDING to Prof. Waite of the American Agricultural Department, the varieties of Pears which are self-fertilising are Doyenné, Le Conte, Kieffer, Buffum, Flemish Beauty, Seckel, and Tyson; the following are not, and must be near some staminate variety to be fruitful: Bartlett, Anjou, Clapp's Favourite, Clairgeau, Sheldon, Mt. Vernon, Lawrence, Howell, Louise Bonne, Souvenir du Congrès, Winter Nelis, Bosc, Easter, and Superfin.

"Not more than three rows of, say, one variety should be planted together, and they should be separated from the next three rows of

the same variety by at least one row of another variety. Probably it would be still better to plant two rows of one kind and one row of

another kind alternately.

"In a majority of cases it was found that the fruit produced by self-fertilisation was quite different from that produced by cross-fertilisation. Occasional specimens of self-fertilised Bartletts were invariably smoother and slimmer, the cross-fertilised ones rougher and broader. This difference was so constant as to be striking.

"A still greater difference was shown in the seeds. Self-fertilised fruits had but few seeds, and these seldom perfect. The crossfertilised specimens showed the regular number of perfect seeds. Buffum, self-fertilised, almost without exception had imperfect seeds. The self-fertilised fruits are not the normal ones, and would not pass

as typical specimens.

"Fruit growing in ordinary mixed orchards, under ordinary conditions, show by their shape, &c., that they are the result of crossfertilisation. With Apples the results were less decided. Pollen taken from other trees of the same variety usually acts in the same way as that taken from the same tree. The different trees all came from the same seed, and are really one and the same so far as the character of flowers and pollen is concerned.

"Many plants procure fertilisation by the aid of the wind. Not so the Pear. This depends altogether on insects for the transfer of the pollen. A great many varieties of insects visit Apple and Pear blossoms—flies, beetles, bees, &c. The honey bee is the most regular and persistent visitor, and on account of its great activity, the most important. During rains, strong winds, or in cold weather these insects do not come out, and flowers may fail to get properly fertilised."

The foregoing has been sent to Mr. Abbey from a colonial paper, and has suggested the following comments from our able correspondent:-

The broaching of this subject at the present time is not inopportune, for a large number of fruit trees yet remain to be planted, and on their selection and arrangement success or failure in a great measure

Every adviser (and they are about as plentiful as Blackberries in September) on fruit-growing for profit is emphatic in restricting the varieties of the several fruits to as few as possible, consistent with a

full supply of produce from the earliest to the latest period of their respective seasons. To this no objection can be taken, but when varieties are enumerated which are incapable of self-fertilisation to the extent of producing full crops of the finest fruit, a few words of caution against their exclusive planting are imperative, for some varieties are not inherently fruitful, but owe their fertility to crossfertilisation by the pollen of another or several varieties.

The incapability of self-fertilisation in some varieties of cultivated plants was first pointed out by the illustrious Darwin in his "Origin of Species," and the soundness of his views and deductions have been verified in the American orchards, where the trees on the dwarf or low standard system are planted in blocks—a number of acres of one variety exclusively. This method is fast becoming the established practice on this side of the Atlantic, therefore it is necessary to point

out its evils as well as its advantages.

By our system of mixed orchards—a great number of varieties and pernicious planting, or a row of one variety and another of a -those incompetent of self-fertilisation would be fertilised by the pollen of other trees in the row adjoining through the agency of the wind, bees, or other insects. A variety absolutely sterile as regards the pollen on its own blossom may be and generally is rendered fertile by the pollen from another variety, and the result is heavier and more constant crops of finer fruit. Instead, therefore, of planting an acre or more of a self-fertilising variety by itself the non-self-fertilising kinds should be planted with it in alternating rows, still keeping the early, medium, and late flowering varieties as much together as possible, for to be of service the blossoming of varieties for cross-fertilisation must be simultaneous. No record of the time of blossoming of Pears has, so far as I am aware, been made, but such would be of great value, not only as showing the difference in the hardiness of the blossoms of different varieties, but as an aid in planting, so that those which expand about the same time might be placed favourably for cross-fertilisation.

The excellent record kept by Mr. W. Paul, and given a few years ago in the Journal of Horticulture, of the blossoming dates of several varieties of Apples, might advantageously be imitated in respect of other-indeed all hardy fruits, for such records are not only interesting but suggestive of the importance of careful observation, and of the great benefit calculated to be conferred on succeeding genera-

tions, who will see in them guidance in their culture.

In the Journal of Horticulture, June 1st, 1893, page 437, I had the pleasure of making some remarks on Prof. Waite's observations on the self-fertilising properties or otherwise of certain-fruits and their varieties, and I now proceed to make further comments on the above excerpt from an American paper with special reference to Pears as coming under my personal observation.

Self-fertilising Varieties.—Summer Doyenné (Doyenné d'Eté) invariably sets its fruits well, the blossom being bold and perfect anthers laden with pollen. (Beurré Giffard has grand flowers, but sets its fruits sometimes indifferently, fertilised with Summer Doyenné it sets splendidly). Le Comte and Kieffer I had from the late Mr. T. Laxton, Bedford, and they proved very floriferous, remarkably hardy in blossom, and set fruit enormously; but their fruit was as "hard as nails," and about as flavourless as Hawthorn twigs, very inferior to our second-rate Pears. Buffum is an October fruit, an American variety, originated in Rhode Island, and however good it may be there it is seldom passable in this country. Flemish Beauty has a grand blossom. Seckle and Tyson are both American Pears. The first has a very pretty and hardy blossom, sets its fruit well, and its fruit is one of the sweetest. It succeeds as a standard in the North of England, and bears fruit when many others have the blossom destroyed by frost. The last is seldom good in this country. This completes Prof. Waite's list of self-fertilising Pears.

Crawford and Lammas are pictures of beauty when in blossom, usually "swarming" with bees, and generally bear heavy crops. Both are better in quality than many newer varieties. Beacon certainly must be classed as a self-fertilising variety, its bold stamens and pollen-laden anthers attest this. Madame Treyve cannot be beaten for a free-bearing kind, the fruit being large and good. Fertility fertilises itself and every non-fertilising variety. Some trees of Passe Colmar that fruited erratically borne constantly when Fertility was introduced near them. Hessle is good for itself, and for fertilising Williams' Bon Chrêtien, Clapp's Favourite, and Jargonelle, as opposite varieties to Hessle as can well be. Bees appear to delight in the free-bearing varieties, and have great partiality for Comte de Lamy, so have I for its fruit—the best of all Pears. Its blossoms are very hardy, and it carried heavy crops in seasons when no other varieties in the open had any fruit worth naming. Jules d'Airolles is another self-fertiliser, and it is far better in cold districts than Louise Bonne of Jersey. Beurré Bachelier is highly commended for free-bearing and good quality in cold districts. Beurré Capiaumont sets its fruit when many sorts fail to crop, but the quality satisfies few. Bishop's Thumb must be included in the

self-fertilising list, and its fruit is not bad eating. General Todleben is very free, also Beurré Diel and Beurré Langelier. The latter is a good Pear, but I cannot recommend the General owing to its grittiness, and Beurré Diel cracks seriously in the open in wet seasons, but is excellent from a wall. Marie Louise d'Uccle is also a self-fertiliser, and bears heavy crops of not very juicy fruit. Van Mons Leon le Clerc has a fine blossom, but tender, yet sets well in warm situations. It bears large, handsome fruits when trained to a south wall. Jean de Witte can hardly forbear setting good crops on itself and others near it, besides it runs Winter Nelis hard for quality. Bergamotte Esperen seldom fails to set full crops, and the fruit attains better size, acquires more colour, and is freer from grit when grown against a south wall. For a specimen of self-fertilisation none excel Passe Crasanne, it will blossom and set even on the current year's wood.

Non self-fertilising varieties.—Let us first take Prof. Waite's list. Bartlett (Williams' Bon Chrêtien) a sad but true indictment. (Dr. Jules Guyot is better as a cropper and in appearance. Its blossom is hardy and self-fertilising, and being good for market might be planted along with Williams' Bon Chrêtien to mutual advantage, for the Dr. has not the quality of Williams' nor anything like it). Beurré d'Anjou, one of the finest Pears, has a tender blossom, and Clapp's Favourite is subject to shrunken pollenless anthers. As to Beurré Clairgeau it is usually well provided with the essential fertilisation organs. Sheldon, a medium sized, high flavoured variety, of Mt. Vernon I cannot find a reference, and Lawrence, medium size, lemon yellow, rich flesh, and grown for shipment, are American varieties of which I know nothing only from report. Howell also is an American variety, said to be rather large, juicy, brisk and vinous. Louise Bonne of Jersey certainly has a tender blossom, but I cannot exactly admit its incapability of self-fertilisation. Souvenir du Congrès blossom is tender, and, like Clapp's Favourite and Williams' Bon Chrêtien, the fruit is liable to scab fungus. Winter Nelis has a poor blossom anything but hardy, also Beurré Bosc, but it bears grandly near Jean de Witte, and is a very fine Pear, while of Easter Beurré I cannot say that its blossom is not self-fertilising, but of its fruit I have nothing good to say except long keeping. Beurré Superfin, my second favourite Pear, the impeachment is only too true as regards its requiring aid in setting the fruit.

Jargonelle and Windsor are apt to produce a number of antherless blossoms, and these usually drop, for the bees are not particularly fond of the flowers of either variety, yet the perfect blossoms set the fruit well. Beurré d'Amanlis, usually fertile, I have quite sterile, its handsome blossoms being devoid of pollen in the anthers. Seedlings from it, as Backhouse's Beurré, are remarkably fertile, and in some cases the variety bears constantly. These changes are mere vagaries. Princess certainly is more self-fertilising than Louise Bonne of Jersey, for it is hardier as a tree, as well as in blossom. Thompson's—my third favourite Pear—and Marie Louise have tender blossoms, and in many cases the pistillate as well as the staminate organs are defective, and they set the fruit better placed near varieties that afford pollen abundantly. Beurré Hardy is the worst setter I am acquainted with—plenty of blossom and only a fruit here and there—qualities making everyone long for more. Jersey Gratioli seems incapable of self-fertilisation, and Hacon's Incomparable bears erratically—sometimes enormously, and then forgets to produce a decent blossom, much less fruit. Knight's Monarch, unsurpassed for musky flavour, holds its fruit better if cross-fertilised and well thinned and supported at the roots.

Glou Morçeau has less deformed fruits if the blossoms are crossfertilised. Beurré Sterckmans appears to have a tender blossom, but it and Ne Plus Meuris do well in company against a wall. Brown Beurré sometimes sets its fruit well, and at others has very defective blossoms and only a sprinkling of fruit. Duchesse d'Angoulême is not nearly so free bearing as Pitmaston Duchess—a very much overpraised Pear, for it is coarse in looks and in quality—not as good as Duchesse d'Angoulême for the shops. These are a few varieties that occur to my mind as requiring aid in fertilising, either by planting varieties near them for bees to transfer the pollen, or by using a camel's hair brush—an interesting and useful occupation.

Some of the best for affording pollen are Belle Julie, Colmar d'Ete, Doyenné du Comice, Durondeau, Eyewood, Emile d'Heyst, Fondante d'Automne, Josephine de Malines, Triomphe de Vienne, besides the others specially referred to.—G. Abbey.

THOUGHTS ON SHRUBS.

THE management of shrubs as a part of a gardener's duty does not receive so much attention as it ought to do. Generally the first serious thought a young gardener devotes to shrubs or shrubberies is when he is brought face to face with some problem on their treatment, and he discovers that he has to rely on an uninstructed judgment for a solution. But young gardeners are

not solely to blame for being largely ignorant of this department of ornamental gardening, as on too many estates shrubs are not properly cultivated. Apart from this, however, one does not find young men very keen of taking advantage of any opportunities that occur for benefiting themselves by a little insight. On the surface, the cultivation of fruit and of flowers forms a more alluring occupation. One sees results in these instances, within a short space of time, but with shrubs and trees there always intervenes a period of waiting. While such is the case it must not be too hastily conceived that no pleasure is to be extracted from shrub culture. There is indeed a great amount of gratification, and personally I am quite as pleased to see these plants do well as others in departments more closely connected with the garden.

In open situations and with soil of fairly good quality shrub cultivation presents no difficulties, but when one is called upon to form living screens, with sand and gravel as a rooting medium, or, even worse, to plant underneath overshadowing trees in soil interlaced with roots, we experience some difficulty. In neither case, so far as my experience goes, is it possible to achieve success without incurring expense, or without more than usual labour. Few plants take kindly to gravel, and even fewer thrive on the fragments left by century-old trees; nor do they appreciate the continued shade. I have seen much money wasted in trying to get shrubs to grow under such circumstances without first preparing the ground and by indiscriminately planting anything that came to hand without taking into consideration adaptability as to position. The best shrub for growing under trees is the Holly, the common sort being excellent; but both Ilex Hodginsi and I. maderiensis nigra are good, and much bolder in effect than common seedlings. Yews and Portugal Laurels do fairly well, and where the shade is only slight Rhododendrons succeed, as also do common Laurels. Small plants of any of these are of no use, but strong, vigorous, well rooted specimens, which in those estates where shrubs are looked after are always to be had, ought alone to be employed.

The plants there ought to be protected against dryness, and the roots of the trees among which they are planted. I go to work in this way in order to circumvent the intruders. First of all a hole large enough to hold the ball of the plant with an extra allowance of 6 inches all round for new soil is made. The plant is then put in, the new soil, in our case generally decaying compost, is added, and made firm, and then at a distance of 9 inches or so from the outer limit of the hole a circle is cut with the spade. This keeps the roots of the trees in check until the newly planted shrub becomes established. Another important matter is to apply water even at this season, that is to say if there appears any dryness about the site. During the following spring and summer, water will in all probability be required by the plants at short intervals. The care taken in this respect during the first year is amply compensated for, as apart from the plants being kept in good health there will be no further need to go over the work another year, as I have seen happen more than once in similar circumstances. An occasional dressing of manure, or of soil put on about this time of year, will keep them in vigorous health.

The method I have adopted with success where the soil is very gravelly consists in selecting strong plants with fibrous roots, in making the hole for the same double the size necessary to hold the ball, and in filling in with good soil or compost. Dryness during the spring and summer must not be allowed, and repeated mulchings of short grass, or of manure if it can be spared, are most helpful. The importance of the latter is very great, and shrubs or trees ought not to be neglected in that respect. If a shrub or a tree is growing in impoverished soil neither will be ornamental, and the ordinary grass would be more pleasing to the eye. Along with other Conifers, I had an Abies Nordmanni to plant, the latter securing perhaps the most gravelly site. As a matter, of course, it did not grow very well; but a barrowful of cow manure applied one autumn made a difference for the better. More the next year, worked a still further improvement, and at present this specimen looks very flourishing indeed. I have during the past week used about three tons of animal excreta all applied to shrubs. Upon the roots of Rhododenrons growing in poor soil these surfacings of good manure act like magic. Old worn out these surfacings of good manure act like magic. stumps become quite energetic, produce strong growths, and in due course flower as well as those which have much better chances. Variegated plants such as Hollies, Yews, Retinosporas and others, when surface dressed with manure or soil of rich quality have better colouring than when left to grow without any manurial

A common error in planting is in placing the roots too deep. Two years ago I recommended to a gentleman some hedging plants the same as I had myself. In the spring he complained they were looking badly, and "Would I see what I thought was wrong?"

Every one had been planted with its stem 6 inches below the surface, and the plants died. Only last autumn I had to overhaul a recently planted shrubbery in which the plants were making no progress, and in this case also deep planting was the fault. A plant with the main roots showing on the surface, if staked and watered, will hardly die, and it is certain to make progress when once it is established. A plant with a buried stem, on the other hand, will never do well.—B.

DEEPLY PLANTED CELERY.

There are no doubt advantages as well as disadvantages attending the use of deep trenches for the growth of Celery, but it is doubtful if the value of deep planting was ever more fully exemplified than in the present season, when shortness of water was a more common complaint than ever before experienced. Shallow trenches this year, with a restricted supply of water, must have seriously affected this valuable winter crop, and especially in soils of a light sandy or gravelly nature. I have never before practised such deep planting as this year, one reason in particular being that the depth of soil available did not allow of it being adopted, but had I resorted to the usual depth of trench our Celery crop must have been a very indifferent one. As it is I think it will bear very favourable comparison with that obtained in seasons of greater rainfall.

Beyond a light watering given at planting time no water could be spared for the Celery. Under ordinary circumstances the plants would have been flagging continuously for want of water, but deep trenches with a high bank of soil on each side afforded a good means of protection from direct sunshine on the surface soil and roots. As much moist and decayed manure was worked into the trenches in the early spring, and these being of a sufficient width for planting two rows of Celery were better able to sustain moisture than a narrower one could do. After the plants had advanced well into growth the foliage completely filled the width of each trench, and this acted as good as a non-conductor to the drying

winds and sunshine in a marked manner.

In a wet summer possibly the chances of obtaining good Celery from such deep planting would not be so favourable; but if the ground is well drained even then I do not see any objection to the system of deep planting, because with ample foliage much of the rain is transmitted to the sides from off the surface of the overhanging leaves, and the roots are thus not in receipt of the whole of the rainfall. In double rows and deep trenches there is a natural gain of length of stem, and this more easily blanched than is the case when the opposite course is followed. Earthing or moulding-up is a simple matter in the one case, when in the other, as less wide spaces are allowed between the trenches, it is difficult to keep the soil up; especially is this so with sandy textured garden soil. There would seem to be a very general prejudice against the planting of double rows of plants in one trench, for it is observable that in the majority of gardens the single row is the one most commonly adopted. The idea is that it is more difficult to earth-up the plants in the autumn, or if not more difficult there is great risk of doing injury through the soil getting into the hearts in the course of "banking" up. I held this view of the matter, and abstained from adopting the double row system for several years; but I find there is no more difficulty in the one case than in the other, and certainly it economises space very considerably, and quite as good material might be grown in double as in single One advantage is gained in wide trenches by the greater height of the sides brought about by the breadth of soil removed. This makes the trenches appear deeper than is actually the case. Ours are two spades in depth, and the loose "crumbs" serve to cover the manure for planting in.—W. S., Rood Ashton.

THE FRUIT KEEPING QUESTION.

Not only as to "the premature decay of Apples," but also as to the keeping of Pears, is the question raised by Mr. Iggulden (page 437), a most interesting one, but it has been all through this autumn season a very anxious one. When a gardener's supply is reduced, he is called upon for a reason for the reduction, and the reason I have given is precisely the one suggested by Mr. Iggulden and supported by Mr. Cheal, and partly supported, but widened, by my neighbour, Mr. A. H. Pearson of Chilwell (page 487), "that the rains which came after the long spell of dry weather filled to overflowing the sap vessels of the fruit; these being dried up and narrowed by the dry weather were not able to bear the strain, and that the after season was not long enough to elaborate and assimilate that rush of sap; hence, immatureness and premature decay."

In some such form as that I have endeavoured to explain when asked, "How do you account for this excessive decaying of fruit?" I cannot say that our late Apples are keeping very badly. We gave them as long a time as we could before gathering, seeing that they had so much to do after the rains came, and now that they are stored away in our airy fruit chamber, they are keeping, what I may say, fairly well. Caldwells or Rymers, with Normanton Wonders, are two of our most reliable long keeping Apples, and we lay by a good store of these. The early Apples, as Early Julyan, Duchess of Oldenburg, and even Keswicks and Potts' Seedling, we only retain sufficient for present consumption, putting the others into the market; and the "Summerings," with their strong, penetrative smell, we never keep by us at all.

Pears, the early ones, have been the greatest trial. Gathered one day they seemed to be decayed the next, and it was most difficult to keep up a daily supply. Doyenné d'Eté, Jargonelle, Clapp's Favourite (a very useful Pear this), and Williams' Bon Chrêtien we were obliged to gather in sections, a basketful or so at a time. By so doing we prolonged our season very materially. Beurré d'Amanlis kept better, though, having trees in different positions, and gathering them at various times, a few at a time, may account for our longer time of consumption. Pitmaston Duchess fruited well, but I cannot join "Northerner," who writes so glowingly of it on page 495 in his estimate; for though we get plenty of fruit, and on the walls of good size, too, we do not get that high table quality which makes people ask for it. Indeed, when I say that we stewed the bulk of ours it will be understood how it stands in our estimation, those at least which did not decay, for this was one this

season which you could almost stand and see decay.

Some of the Pears which are invariably good with me have this season been conspicuously uncertain. One favourite, Fondante de Charneu, was little better than a good young Turnip; usually it is asked for more than any other in its season. To set against that Vicar of Winkfield is this year singularly good. We are using it now with much acceptance. Louise Bonne of Jersey were very good in quality, but smaller than usual, and kept the best of all save one, and that is a December Pear, not in much cultivation, Epine du Mas. It is a prolific bearer, of good quality, the fruit keeps well, and comes in at a most acceptable time. We have just finished them, and are now using Winter Nelis, always a welcome fruit in the dining-room. Josephine de Malines and Easter Beurré are keeping fairly well, and will be in very soon. Nec Plus Meuris and Glou Morçeau did not fruit very well this year, but are keeping well, though in each of these varieties their season is about a month earlier than usual, and the Pear consumption will therefore be limited by that amount of time. Beurré Sterckmans did so badly in ripening out that I headed them down, and worked other varieties upon them.

I must go back a little and say that I have only words of unstinted praise for such Pears as Doyenné Boussoch, Doyenné du Comice, Marie Louise d'Uccle, Maréchal de Cour, and Emile d'Heyst, as well as Fondante d'Automne, but as for Beurré de Capiaumont, Beurré Clairgeau, Beurré Bosc, Beurré Van Mons, and Fertility, the less said about them the better. The last-mentioned Pear is unquestionably a heavy and constant bearer, much more so than the old Hessle, but its table quality is very low. That is as I have proved it; it may do differently elsewhere. That fact, by the way, is a truth which a long experience has given me, that a fruit, or vegetable indifferent in one place may be quite the opposite in another, and therefore I find it wise not to dogmatically condemn anything in the fruit and vegetable line, but just chronicle my own personal experience. Fertility has had, however, one feature this year, and that is to die off, as to its leaves, in ruddy glory, as red almost as that of a Virginian Creeper. These fruit experiences are very interesting reading to me, and so I venture to send this small contribution.—N. H. P., Notts.

THE CRYSTAL PALACE COMPANY'S SEPTEMBER FRUIT SHOW.

THE present appears to me to be an opportune time to express a hope that the Crystal Palace Company may next year resume the holding of an exhibition of choice and other fruit in conjunction with the National Dahlia Show the first week in September. This unfortunately has been discontinued the last two years, owing, I suppose, to the fact that a fruit Show embodying all the fruit classed included in the "Palace schedule" was to be held at Earl's Court, London, in 1892, and a series of little fruit shows held in the same place during the past summer, and which latter shows appear, judging from recent correspondence in the Journal, not to have given the same satisfaction to prizewinners that resulted from the management of the International Fruit Show held in the same place last year.

held in the same place last year.

I think it would be a great pity—not to say a pomological calamity—that there should exist any cause or causes to prevent the Crystal Palace

Company holding its great Fruit Show the first week in September, as in former years (excepting 1892 and 1893). As an exhibitor for several years past in all the principal classes at the Show in question, as well as at many leading shows in the provinces, I am in a position to say that the Crystal Palace September Fruit Show has been looked upon, and justly so, as the great show of the season—in fact, the National Fruit Show of the country.

The Palace, as far as my experience goes, is quite unique as a place for holding horticultural exhibitions, and the details of the exhibitions held there have always been admirably arranged; and last, though by no means least, the prize money has always been forthcoming soon after it had been won. I am sure that in thus writing I am only expressing the sentiments of the numerous fruit growers who used to annually compete in the fruit classes at the Crystal Palace Show, and who looked forward with much pleasure to meeting one another in friendly contest early in September every year. Permit me to express a hope that the Crystal Palace Company may give us—its old and regular exhibitors—an opportunity of doing so again in 1894, as the Shows in question gave a great impetus to the movement of high-class and profitable fruit culture.—H. W. W.

THE ROYAL HORTICULTURAL SOCIETY AND SOUTH KENSINGTON.

You state in an article on page 492 in your last issue that "in consequence of a leakage from the Council of the R.H.S.," proposals as to the removal of the meetings of the Society to the Imperial Institute are known to be under consideration. I made careful inquiries at a late meeting of the Council whether any member had communicated with the horticultural Press, directly or indirectly, on this subject, and was assured that no member had done so. I think this contradiction should be published, because at the time you name the proposal had not even been submitted to the Council, and it is therefore a somewhat severe, and I believe unjust, imputation on a member or members of that body.—HENRY J. PEARSON.

We publish the above correction with very great pleasure, but at the same time we think Mr. Pearson will have no difficulty in admitting that his inquiries at a late meeting of the Council were not made in consequence of anything that appeared in the Journal of Horticulture. We did not say the proposals were "known" to be under consideration, but that there was a "rumour" of the nature indicated. This was quite true. It also appears to be equally true that the rumour was not groundless, as proposals were admittedly made by the authorities of the Imperial Institute for the removal of the headquarters of the Royal Horticultural Society to South Kensington. "Rumour" is quite liable to be at fault relative to the origin of a leakage, but that there was an "escape" in this case from somewhere appears self-evident, or there could have been no occasion for any gentleman to make "careful inquiries" on the subject at a Council meeting held prior to the publication of our remarks last week. We unhesitatingly accept Mr. Pearson's assurance that no disclosures whatever were made by any members of the Council, and we include in this assurance all attendant officials.]

A RETROSPECT.

TIME has been given me to look back over the last fourteen years or so, during which my heart has been wrapped up in matters horticultural. Although the love I have borne and bear still for everything connected with a garden has never been a means of supplying my daily wants, but has, on the other hand, impoverished me, I cannot even now say that I regret it.

During this period I have seen horticulture advance by giant strides, and gardeners become in their best representatives a body of scientific well read men. The pages of the *Journal of Horticulture* bear testimony to this.

I have also seen of late years the culture of fruit brought to the front, and the old rough and ready ways of planting any variety the nurseryman sent abolished. Dr. Hogg's "Fruit Manual" and Mr. Wright's "Prize Essay" have been of inestimable worth to our young planters.

Many changes have happened of late years; we seem to have lost an unusual number of first-class gardeners, and when Mr. Laxton (whose helpful letters to me were a source of great comfort at a trying time) went over to the majority I felt a blow I shall never forget.

How much knowledge and pleasure I have gained by the perusal of "our Journal" I know not. This I know, that there was always something fresh to learn, always something to add to the pleasure of reading. I owe very many thanks to the contributors to "our Journal," many of whom have been most courteous and kind to me. I heartily return my thanks to one and all. If I might single one out I should say that any contribution with "D., Deal," underscribed has been a lasting pleasure to me.

And now, starting as I am on a long journey from which I shall not return, I desire to thank our kind Editor and each contributor for the

knowledge, pleasure, and profit I have ever received from them.— H. S. EASTY, Ashdene, Hill Lane, Southampton.

[It is with profound regret, in which our readers will share, that the painful malady from which Mr. Easty has long suffered has at last been pronounced mortal. Mr. Easty is a gentleman by birth, and has devoted his means to acquiring information by travels abroad and experiments at home, until those means are, we believe, exhausted, and we fear he has difficulty in obtaining simple home comforts. Under these circumstances the calm trustfulness of his pathetic letter cannot but evoke admiration, and impart a suggestive lesson on a subject of a momentous character.]

ABERDEEN ROSES.

WITH a view to keep things right, may we ask you to kindly insert the following remarks, by way of correcting a mistake in "D., Deal's," very interesting article on "The Rose in 1893," which appeared in your issue of the 30th ult. (page 494)? We observe he credits Messrs. Harkness & Sons with carrying off every first prize for "seventy-two's" in the kingdom.

We only staged in two "seventy-two's" during last season in England, and had the satisfaction of winning them both. The first was at Tibshelf (Derbyshire), on July 25th, and we understand that this was the best and keenest contested "seventy-two" of the season, there being six exhibits staged, Messrs. Harkness coming in second. The second was at Elland (Yorkshire) on August 15th, where we also won the first prize.

We do not wish by any means to detract from the Messrs. Harknes,' splendid record, but we take this opportunity of pointing out that we met the above-mentioned firm eighteen times in England during the season, commencing July 20th, with the following result—viz., Messrs. Harkness & Sons two first prizes, Cocker & Sons fifteen first prizes and one equal.—James Cocker & Sons, Aberdeen.

THE NATIONAL ROSE SOCIETY AND THE FUTURE OF EXHIBITING.

I TAKE advantage of some remarks made by "D., Deal," in his article on "The Rose in 1893," page 494 of the Journal of Horticulture last week, to say a few words as to the future of the Society as they occur to me, both in regard to its membership and the advantages which are now offered, and those which, I think, should be offered to new rosarians. "D., Deal"—than whom there are few more experienced, whether as men of the world or as "past masters" in Rose matters—says, in regard to the annual recruiting of rosarians for the Rose shows of the future, "one asks, with some degree of misgiving, where are the successors of the past" [why not present?] "giants to come from?" This question may be one fraught with consequences of the first magnitude to rosarians, and is of vital importance to the N.R.S., therefore it is one which, having been put forth by a leading official at what is apparently a propitious moment, might be discussed with advantage at the annual meeting of the N.R.S., which coincides with the date of the next issue of the Journal.

It is of vital importance to the Society that its membership should be materially increased, as there are many members who, when it first started in December, 1876, were the mainstay of its exhibitions, and who now either from age or disinclination have dropped out of the fray. Future exhibitions and the Society itself must sooner or later depend for support from those who are now becoming interested in Rose growing, and it is with the object of sounding a note of warning to the N.R.S. executive that I write this letter.

I have for some years been a persistent advocate for the encouragement of new members and small growers amongst rosarians, and unless the Society offers more inducement in the future than it now does to "young" rosarians, it will find it a matter of difficulty to keep up its roll; death and desertion will soon outnumber the yearly recruiting, and the number inscribed on the roll-call will then be found a diminishing quantity.

I do not write this letter as a pessimist, but in the present day a society or a business must either advance or retrograde, you cannot stand still and succeed; and I say that when I find there are forty-eight local secretaries of the N.R.S., and through that body of supposed active workers only thirty-four recruits (not counting those I myself brought in this year) were obtained in 1893, the Society is in a perilous state, especially if its schedules are to be maintained at a satisfactory level. I have worked fairly hard and not unsuccessfully in getting in new members; but I confess that the question often asked me, "What do I gain or obtain by becoming a member of your Society?" frequently finds a reply difficult, and at times I have been puzzled to find a suitable one, but the question being a proper one there should be a satisfactory reply ready to hand. I therefore appeal to those now responsible for the Society's working to offer next year advantages to new members—do away with useless classes in the prize schedules, such for instance as the one for residents within an eight-mile radius (which is practically a monopoly to a very small coterie), and in the place of those eliminated

classes substitute several new ones for rosarians who have joined the Society within say three years, or those who have never won a prize at its exhibitions. By adopting this plan a nursery will soon be formed, and thus the babes of the present may become the giants of the future, and probably not unworthy to be compared with their predecessors.—CHARLES J. GRAHAME, Croydon.

MANURING AND TRANSPLANTING ROSES.

AUTUMN and winter are the best times in the whole year for applying a liberal dressing of solid manure to the soil devoted to the growth of the queen of garden flowers. Where good manure is plentiful and is largely used for the purpose the difficulties of Rose growing are reduced to a minimum. No mere sprinkling of this necessary fare will suffice to keep such gross feeders in health and vigour. A coating of from 3 to 6 inches in thickness should be spread evenly over the whole surface of the bed, and as the work proceeds be packed closely around the stems of standards or the stools of bushes. The manure then answers the two-fold purpose of protecting the roots from severe frosts and of supplying them with abundant nutriment, as the rains and snow convey its most powerful constituents to the soil. This layer of manure should remain upon the surface of the soil till the Roses are pruned in the spring, when it is necessary to fork the beds over to a sufficient depth to admit of covering the manure. Deep digging around Rose bushes should at all times be avoided, as it is most inimical to their well being, by driving the roots deeper into the soil, when the aim of the cultivator should be to keep them near the surface.

On light hungry soils I believe cow manure to be unsurpassed for Roses, for it is not only extremely rich in easily assimilated plant food, but being also close in texture helps to make the soil more retentive of moisture, an object not easily accomplished when ordinary farmyard manure containing a good percentage of straw is employed unless very much decayed, in which condition its manurial properties are considerably lessened. On the other hand, when dealing with a heavy soil fresh horse manure containing a good amount of strawy matter is of great utility in keeping the soil open so that the action of the weather may

pulverise it.

I find it an excellent plan to lift and transplant bush Roses every three or four years; this is especially the case with those on their own roots, as by continually throwing up suckers in various directions the centre of the stool is often left bare. In addition to the advantage accruing from this point of view, the bushes are undoubtedly kept healthy and vigorous, without producing such exceptionally strong shoots as undisturbed bushes do when pruned closely to secure large blooms. The reason why periodically lifted Roses give such satisfactory result is, I doubt not, in consequence of the number of fibry roots produced under this system of management, which also gives opportunities of frequently trenching the soil and incorporating manure with it throughout its entire depth. Ample food being thus within easy reach of the roots they show no inclination to wander away in search of it, making in their course long fibreless lengths, which all cultivators dislike to see.

November is perhaps the best time to take in hand the work of

November is perhaps the best time to take in hand the work of lifting or planting the hardier kinds of Roses, and those enthusiastic rosarians whose Roses are the most important feature in their gardens, will doubtless have managed to carry out the work; but gardeners who have extensive charges in each department to attend to must perforce fit in this kind of work whenever opportunities arise and the weather is favourable. November is a busy month with most of us, as with the leaves from numerous trees falling fast (which if not quickly collected are swept by the wind in all directions, only to give additional labour) and other alterations also in progress, planting must necessarily be delayed; however, by choosing an open spell of weather when the ground is fairly dry, we have hitherto been able to perform this kind of work with the best results, and contemplate undertaking it again at various times during the next three months.

Our plan of procedure is to take up the Roses, carefully cut away any old fibreless parts or stools from which the younger portions have extended, and at the same time making a clean cut at the ends of all other roots, so that they are in readiness for replanting. They are then laid upon the ground and covered with mats while the beds are being prepared for their reception. This preparation consists in double-digging, at the same time giving a heavy dressing of manure, which is well incorporated with the soil as the work proceeds, and a little of the subsoil is mixed with the upper strata. When the digging is completed the Roses are at once planted, spreading the roots evenly in all directions, and keeping them near the surface. Any plants which have become leggy ought to be planted obliquely. Light soils should be trod firmly; but when dealing with heavy ones the fork or spade should take the place of the foot in pressing down the soil. A couple of inches of rough manure must in all instances be placed upon the surface to complete the work.—A Lover of Roses.

AUTUMN AND WINTER FLOWERS.

Not often is a finer display seen than I found on a recent visit to Norman Court, the residence of W. Baring, Esq., as provided by the able gardener, Mr. J. Hughes. Apart from Chrysanthemums, which were admirably represented, Salvia splendens was very striking. The plants were grown from cuttings rooted in March and planted out in the open, afterwards taken up and established in 10-inch pots, the soil used being loam and leaf mould, no sand. Well-grown Zonal

Pelargoniums intermixed with Mignonette and Heliotropes formed an effective combination, and Primulas were very fine indeed.

The stage on the south side of the Rose house was filled with Miss Jolliffe Carnations (the improved strain), the blooms being not in hundreds but thousands, and well worth a long journey to see. Mr. Hughes may be justly proud of his success in the culture of these plants, and it seems a pity it should not be convenient to place them before the Royal Horticultural Society's Committee, where I have no doubt they would receive the recognition they deserve. There are 200 plants, in 7-inch and 9-inch pots. The cuttings were rooted about the middle of February in slight bottom heat, the plants being eventually potted and grown in a cold frame. The final potting was done in July, the compost then used being good maiden loam, charred soil, leaf mould, with a little bonemeal and sand added. Some of the best plants had twelve spikes, carrying from forty to fifty blooms. The house is kept cool with plenty of air, and the plants, which are sturdy in growth, are kept free from insects. On the north stage of the same house was a collection of dwarf German Scabious. These plants were kept growing through the summer, but all flower spikes as they appeared were pinched off until a few weeks ago. At the present time they are in full bloom, affording a pleasing variety of colour, in 32-size pots, some of the plants carrying from fifty to sixty trusses of flowers.

Other winter-flowering plants are not forgotten. Cyclamens, Marie Louise Violets, and Cinerarias are grown in pits, as are Bouvardias, these being planted out, and will no doubt prove of great service. I hope these few stray notes may show what can be done with perseverance: Such good work merits appreciation, and Mr. Hughes is to be congratulated on what he has accomplished so well.—W. PALMER, F.R.H.S.

EVENTS OF THE WEEK,—Comparatively few events of horticultural interest will take place in the metropolis during the ensuing week. The Royal Botanic Society will hold a meeting in the Gardens, Regent's Park, on Saturday, December 9th, and the Committees of the Royal Horticultural Society will meet at the Drill Hall, James Street, S.W., on Tuesday, the 12th inst.

THE WEATHER IN LONDON.—Various changes in the weather have taken place during the past week. On Sunday morning a severe frost prevailed, 12° being registered in some suburban districts. Towards evening on that day it became milder, and a little rain fell during the night. Monday was mild and dull, Tuesday being colder and foggy in the morning. Wednesday opened dull, but at the time of going to press it is clearing.

WEATHER IN THE NORTH.—The weather has been changeable for the last eight days, with occasional high winds and drizzling showers. On the morning of the 30th ult. the ground was white with snow, and heavy falls were reported from the northern counties. December opened with frost, 7° in the morning of the 1st, and 14° on Saturday morning. By evening it rained heavily, and till Tucsday morning the weather has been fresh and generally fine for the season.—B. D., S. Perthshire.

— EARL'S COURT EXHIBITION. — My attention having been drawn to the remarks of one or two correspondents (pages 444 and 493) who have exhibited at Earl's Court, and not received their prize money, I regret to say that the delay has occurred through the illness of the Financial Director, who has been, and is now suffering from influenza. As soon as he is able to attend to business the prizewinners will receive their awards.—HARRY TURNER, The Royal Nurseries, Slough.

ROYAL HORTICULTURAL SOCIETY.—The last meeting of the Royal Horticultural Society for the year 1893 will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, December 12th. The Fruit, Floral, and Orchid Committees will assemble at twelve o'clock, and new Fellows will be elected at three o'clock.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. G. J. Ingram, Secretary, 50, Parliament Street, London, S.W., writes:—I have been requested to acknowledge the following sums received in aid of the funds of the Gardeners' Royal Benevolent Institution: Mr. Bailey Wadds of Birdsall, York, £2 11s.; and the Reigate and District Chrysanthemum Society, £31 10s.

— CHANGES IN THE LONDON PARKS. — After many years' service in the London Parks Mr. Gibson retires through failing health from the position as Superintendent of Victoria Park, and his friends hope he will enjoy his pension for many years. Mr. J. W. Moorman (Dulwich Park) succeeds Mr. Gibson at Victoria Park, Mr. Bailey goes from Southwark to Dulwich, Mr. Curle from Waterlow to Southwark, Mr. Pallett from Myatt's Fields to Waterlow, while the propagator at Victoria Park goes as Superintendent to Myatt's Fields. Mr. Moorman's advancement, from the smallest garden (Myatt's Fields) to the largest park under the London County Council, within a period of five years, affords high testimony to his energy and ability, and the other superintendents have won their promotion by the excellence of their work. The London parks were never better cared for by the authorities than at the present time.

Memorial Hall, Farringdon Street, E.C., on Tuesday evening last, Dr. A. B. Griffiths gave a lecture on artificial manures. Mr. T. W. Sanders presided, and there was a good attendance. The lecturer dealt at length with the physiology of plants, and described the manner in which the roots absorbed the necessary nourishment from the soil. Formulæ of special manures for various plants and soils were also detailed and apparently appreciated by the audience. An interesting discussion followed, during which numerous questions were put to the lecturer. In addition to the customary vote of thanks, it was unanimously resolved to award Dr. Griffiths a bronze medal for his able lecture.

DEATH OF MR. H. G. QUILTER.—Many of our older readers will learn with regret of the death of Mr. H. G. Quilter, which took place on November 23rd, at Felixstowe. Mr. Quilter was seventy years of age, and was at one time a very prominent figure in horticultural matters. Some years ago he organised a most successful exhibition under the auspices of the Royal Horticultural Society at the Aston Lower Grounds, Birmingham.

- WHITE EARWIGS.—I regret that I missed the query made by "Lanarkshire Bee-keeper" at page 458, and may now endorse Mr. Hiam's explanation. After the final ecdysis, or cast of skin, which brings the earwig to its perfect condition, the insect is white or pale in colour for a time, as is also the familiar cockroach of our kitchens. It has been found by experiment that a cockroach, after this moult, is white for several days, even if exposed to the light, and an earwig may take as long to acquire its usual colour, only it is probable that it remains usually in hiding, from prudential motives, till it has both darkened and hardened. If any friend has undeniable testimonials in favour of the earwig I should be glad to see them; at present, it must be owned, the insect has anything but a creditable character. One thing that much surprised myself and other observers of earwigs this summer was the plump and well-to-do condition of most of the individuals; evidently, somehow or other, the long drought had not hurt them .- J. R. S. CLIFFORD.

"A LANARKSHIRE BEE-KEEPER" writes:—"While I am obliged to Mr. J. Hiam (page 491) for his explanation of the above, I must say, without any contradictory spirit, I am not satisfied with it. We ought, however, at all times to give due deference to others' opinions and observations, as well as never to put a misconstruction upon what is said. It was gardeners' friends, and not 'bee-keepers',' I said on page 458. I have watched over and over again the carnivorous habits of earwigs amongst the larvæ and pupæ of 'gardeners' enemies,' just as many of the spiders are."

CURIOUS SPELLING OF NAMES.—I fancy "S. H." (496) has not had much experience of the duties appertaining to the post of Secretary to an autumn Exhibition, or he would not suggest the examination of the names by this official to correct those mis-spelt. I often pity the Secretary when perhaps half a dozen exhibitors are asking him questions as to the position of their exhibits, inquiries for class cards, and making appeals for admission tickets. Where from 1000 to 2000 cut blooms are staged I imagine those officials would not thank "S. H." for the suggestion of examining the names. I am aware that the manner in which some names are mangled in spelling is deplorable, but I fear the remedy lies only in the hands of exhibitors themselves. It is not always that catalogues agree either in the proper spelling of the names. Where this occurs of doctors differing, who shall decide?—E. M

— MR. H. CANNELL.—We learn from a Kentish paper that Mr. Henry Cannell, head of the firm of Messrs. Cannell & Sons, seedsmen and horticulturists, of Swanley and Eynsford, has been awarded by the Council of the Academy (Industrial) of Science and Arts, Brussels, with the diploma of that Institution, and the free membership of the same, the honour having been conferred for useful invention, commerce, and for the common good.

— WE have much pleasure in mentioning that we have received from M. Martinet of Paris a copy of his new weekly paper "Le Petit Jardin Illustré." It is published at the price of 10 centimes (one penny), and consists of sixteen octavo pages. It is worth remarking that this is the first weekly publication in France upon the subject of Horticulture, and if there is anything like the same demand for it that there is in England for papers of this character, a prosperous career awaits it.

- A NEW WATER LILY .- From Nymphæa dentata, fertilised by the pollen of N. Sturtevanti, Mr. William Tricker has secured a new hybrid night-flowering Water Lily, which is distinct and produces flowers of great beauty. In the specimen of Nymphæa Trickeri which I have seen, says Mr. J. N. Gerard in the "Garden and Forest," the leaves are 18 inches in diameter, finely toothed and a glistening emerald green above. The under surface is dark brown and boldly ribbed with numerous prominent veins. The flowers are semi-double with three rows of petals, and in form quite identical with N. Sturtevanti, having even the tendency to plication of the edges of the petals. It differs, however, not only in colouring of the leaves, as noted above, but also in the distinct colouring of the flowers, which may be described either as a light rose pink, shading irregularly to white, or as white, irregularly suffused with pink, the general effect being a light pink flower with white markings. Under artificial light it is the most brilliant of all Lilies. The white markings are then not distinguishable, and it appears as a most charming glow of light rose pink of very pure tone.

- Mr. GERARD also observes: - There are no nobler Nymphæas than N. rubra, N. Devoniensis and N. Sturtevanti, and N. Trickeri, the lightest in colour of the quartette, is apparently an important addition to the series. The night-blooming Nymphæas are precious flowers, which should meet with wider appreciation. Though they open in the evening they remain open during the early morning, and in a later stage still longer. Their flowers are charming under artificial light, and exquisite effects in decoration are possible by their aid. They will be probably always somewhat rare and uncommon, for, while the plants offer no difficulties in cultivation, to be well grown they require considerable space, and this will prevent their being grown for commercial purposes. It will be readily seen that an arrangement of Nymphæas in a suitable receptacle is one which is delightful in itself, and sure to excite attention and give pleasure. Such arrangements are frequent with ordinary day-flowering Nymphæas, but these, unfortunately, close in the evening, so that plants like N. dentata, N. rubra and its hybrids, which are open when they can be generally most enjoyed, are especially valuable.

PRICES OF GRAPES.—Such dolorous reports occasionally appear with respect to the miserable returns that are obtained for Grapes—returns that seem utterly absurd assuming that the fruit be at all good—that I venture, as some antidote to these statements, to publish what is written in a letter lying before me, received a few days since from one who is both a first-class grower and one in a large way, for his annual output is measured by tons. Perhaps the fact that a grower can be depended upon to keep up a supply of first-class samples in great bulk over some nine months of the year helps to the securing of better prices. The writer says, and he specially refers to what has been written in the Journal of Horticulture, "I still keep cutting Grapes. To-morrow the price will be 3d. more, the lowest being 2s. per lb. It may be of interest to you to know that on Monday I sent seven baskets of Alicante to ——, really the worst I had; the return, 1s. 7d. to 1s. 10d. per lb., very satisfactory, and am asked to send more. One shop alone at ——— has taken seventeen baskets this week, and other good quantities have gone to other towns. In three weeks we have turned over £100-not bad for our little place." Here is no complaining, but perfect satisfaction. When we read such distressing complaints as to prices it would be much more instructive could we see the samples. In the case quoted very little is done through markets, but chiefly with the shopkeepers direct. This fact serves to show that it is the middleman who gets the growers' profits. Why do not growers form a syndicate, and be their own salesmen, retail as well as wholesale?-D.

- WE learn that Mr. John Waterer, son of the late Mr. John Waterer, and brother of the late Mr. Michael and Mr. Fred Waterer, died at Bagshot, on the 21st ult., aged 67 years.
- —— THE PHYLLOXERA IN SICILY. It is reported that serious damage is being caused by the Phylloxera in Sicily. In the provinces of Syracuse and Catania also the loss, owing to this cause, is most alarming.
- —— DIOSPYROS KAKI.—Readers may be interested to know that a plant of the Japanese Persimmon, Diospyros Kaki, has this year borne five fine fruits in the succulent house at Kew. The plant is stated to be a grafted one and is 6 feet high.
- MR. W. GLEESON, The Warren House Gardens, Stanmore, desires us to announce he has been awarded a valuable set of silver fish carvers, offered by Mr. Colchester, of Ipswich, for the best exhibit at the Watford Chrysanthemum Show.
- ALL classes in Ireland heard with surprise and sorrow of the death of the DUKE OF LEINSTER at Carton, Maynooth, on December 1st. His Grace, who has been thus untimely cut off by typhoid fever at the age of forty-two, was President of the Royal Horticultural Society of Ireland, a post held by his father, the late Duke. A lover of Nature, taking a keen interest in all pertaining to gardening and forestry, few could surpass him in knowledge of timber and ornamental trees.
- SHADING PLANTS.—Is not the too protracted use of summer shading upon greenhouses injurious to plants? Plants in my own garden have not been satisfactory when covered with obscured glass, while those grown under clear glass were healthy and fruitful. The Spider-web Sedum previously mentioned by me has only in two years one rosette under rough glass, the web being scarcely visible, while that under clear glass has filled the space with prettily webbed rosettes.—T.
- THE TOTAL RAINFALL AT ABBOT'S LEIGH, HAYWARD'S HEATH, SUSSEX, for the past month was 208 inches, being 1.59 inch below the average. The heaviest fall was 043 inch on the 14th. Rain fell on seventeen days. The maximum temperature was 61° on the 3rd, the minimum 25° on the 1st; mean maximum 46.06°, mean minimum 35.13°; mean temperature 40.59°, nearly 2° below the average. Although we did not feel the full force of the storm of the 18th the barometer felt it; the reading on that morning was 28.75. It was very unsteady from that date till the morning of the 26th, when it made a remarkable rise from 29.18 to 30.03 on the following morning, where it remained stationary till the close of the month. December opened wet and stormy, but cleared out in the afternoon to frost, with a keen N.W. wind.—R. I.
- THE WEATHER LAST MONTH.—Mr. W. H. Divers, Ketton Hall Gardens, Stamford, writes: "November was showery and dull, but we had very little fog. There were nine bright days. The first snow of the season fell on 6th. We had a gale and a fall of snow on night of 18th. Wind was in a northerly direction nineteen days. Barometer: highest 30.42 inches at 1 P.M. on 21st, lowest 29 inches at 10.45 P.M. on 17th. Total rainfall 1.93 inches, which fell on twenty days. The greatest daily fall came as snow on 18th, viz., 0.40 inches. The total is 0.73 inches below the average for the month. Temperature: highest in shade 60° on 3rd, lowest 21° on 5th; lowest on grass 14° on 5th. Mean daily maximum 47.46°. Mean daily minimum 34.43°. Mean temperature of the month 40.85°. The garden spring ran 6 gallons per minute on 30th."
- SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, NOVEMBER.—Mean temperature of the month, 41.1°. Maximum on the 3rd, 57.8°; minimum on the 5th, 24.3°. Maximum in the sun on the 6th, 93 7°; minimum on the grass on the 5th, 17.5°. Mean temperature of air at 9 A.M., 40.5°; mean temperature of soil 1 foot deep, 42.8°. Number of nights below 32°, in shade fourteen; on grass, nineteen. Total duration of sunshine in the month, thirty-seven hours, or 15 per cent. of possible duration; we had nine sunless days. Total rainfall, 2.06 inches; rain fell on twenty-three days. Average velocity of wind, 11.1 miles per hour; velocity exceeded 400 miles on four days, fell short of 100 miles on four days. Approximate averages for November: - Mean temperature, 42.3°; sunshine, fifty hours; rainfall, 2.03 inches. A rather cold and dull month, with a large proportion of northerly winds, and about average rainfall, though with more than the average number of rainy days. No damage was done here by the gale on the 18th, but the snow which fell drifted a good deal, and several roads were blocked next day,-J. MALLENDER,

- Wanderings in Wicklow—A Correction.—In the article on this subject (page 487) referring to Shelton Abbey, it is inadvertently stated that Mr. Wilmett is "not an energetic man." The sentence should read, "not an emergency man."
- —— DEATH OF MR. HOWARD.—We announce with regret the death of Mr. Howard, on November 27th, at Southgate. He was well known as a grower for Covent Garden Market, and at the time of his death was in his 59th year. Mr. Howard was an enthusiastic supporter of the Royal Gardeners' Orphan Fund and other charitable institutions.
- AUSTRALIAN FLOWERS. Apropos of the note re a "Wild Flower Carnival," published on page 491, we are informed that a bouquet of Australian wild flowers is now on its way to England frozen in a solid block of ice, and intended as a present for the Queen.
- A CORRESPONDENT writes:—"The death of the EARL OF WARWICK has taken from us an English nobleman whose love of horticulture was as strongly marked as his courtly gentleness and artistic tastes. The late Earl took the deepest interest in every phase of gardening, and cherished by constant watchfulness many of the rarer trees and shrubs at Warwick Castle; and his knowledge of their nomenclature was as thorough as his admiration for their beauty. Even in the confines of the sick room the presence of some favourite flower seemed to keep keenly alive his interest in gardening. His Lordship's decease is deeply regretted by all who knew him, and by none more so than those who were constantly associated with him. His Lordship's charm of manner and kind consideration to all around won the respect and love of equal and dependent alike."
- THE WEATHER IN HERTFORDSHIRE. Mr. E. Wallis, The Gardens, Hamel's Park, Buntingford, Herts, writes:—The weather during the past month has on the whole been very favourable to the horticulturist, planting and outdoor operations of all kinds having had very few drawbacks. The slight frosts have tended to check the very late growth, and harden vegetation against the coming winter. Like each of the preceding months of the present year November has shown some points quite opposite to its usual character. There has been an entire absence of fogs, and we shall long remember the terrific gale of the 18th and 19th, which much resembled the gale of January 18th, 1881. Rain has fallen on thirteen days during past month. Maximum in any twenty-four hours was 0.63 on the 25th; minimum, 0.02 on the 24th. Total during the past month 2.31 against 1.75 of 1892."
- --- HERBACEOUS GRAFTING.-Professor L. H. Baily of Cornell has been grafting the Tomato on Potato plants, with the result that the upper portion bore Tomatoes and the lower portion bore Potatoes.. This seems natural, and yet it is in direct opposition to experiments. which have been reported as having been made in other countries, where the result was said to be an intermixture of the two, and the facts have been brought forward as illustrating what is known as graft hybridism. The result of Professor Baily's experiments, says "Meehan's Monthly," does not show that the other experiments have been misreported or misconstrued, but it certainly does go to show the value of continually repeating experiments which are said to produce such unique results. Professor Baily found that Peppers could be grafted on Tomatoes, and that Tomatoes could be grafted on Peppers, and that these, including Egg plants, would grow when grafted on the "Alkekengi." It should be remembered, however, that all these plants are of the same natural order, and very closely related—all belonging to Solanaceæ, and there is no more surprise at this result than the grafting of the Pear on the Quince or the White Thorn. In the use of material for this herbaceous grafting Professor Baily notes that the wood must not be too young, but rather on the approach to maturity.

A CHARMING FLOWER BASKET.

ONE of the most beautiful ornaments that could be devised for the flower garden is a wicker basket, as shown in the illustration (fig. 74), and which is standing in the garden of Alfred de Rothschild, Esq., Halton, Tring. The basket is of huge dimensions, being about 14 feet across, upwards of 5 feet in height, the cross handle of course rising much higher than this. When filled with flowers it is very effective, and possesses the additional merit of being most unique. The basket is lined with turves, grass side outwards, and in this is placed a casing, which carries the weight of the soil. During the past summer the centre was bright with Lilium longiflorum and L. tigrinum splendens

grand Hydrangeas, Petunias, and Tropæolums, the latter being allowed to hang in festoons over the sides. Every plant was carefully tended, and the arrangement of the flowers reflected credit on Mr. Sanders, the head gardener.

DEATH OF MR. EPHRAIM SYMS DODWELL.

MANY of our readers will share in the regret we feel in recording the death of Mr. E. S. Dodwell, which took place somewhat suddenly at his

Born on the 28th November, 1819, at Long Crendon, Bucks, Mr. Dodwell had but recently completed his seventy-fourth year, and only this summer Mr. and Mrs. Dodwell celebrated their golden wedding, and were presented by their floricultural friends with a silver tea and coffee service at the last Show of the Oxford Carnation and Picotee Union, held, as customary, in Mr. Dodwell's garden, of which Society he from its commencement had acted both as Secretary and Treasurer. For many years he carried on business as a cigar merchant in St. Mary Axe, London, but retired from the same in 1880. In the following year he took up his residence in Oxford, where he is best known in connection

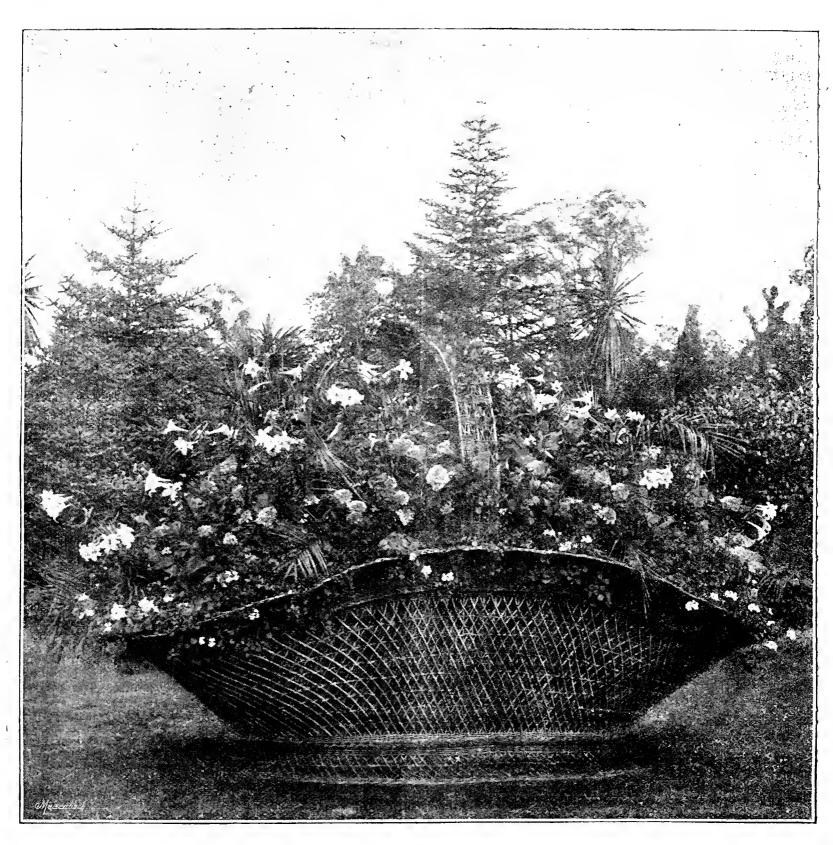

FIG. 74.—A FLOWER BASKET AT HALTON, TRING.

residence, Stanley Road, Oxford, on Thursday, the 30th ult. We understand that the deceased gentleman was in his usual state of health up to the previous day, but for some some years past he had suffered from a chronic bronchial affection, which necessitated his exercising continuous care with regard to exposure. Mr. Dodwell was seen in Oxford on the day before he was taken ill, but appeared to be more excited in his manner than customary, and on his return home it was thought advisable to call in his medical attendant, who, however, did not anticipate any immediate danger to arise from his symptoms. On the following (Thursday) morning the most painful surprise was occasioned the members of his family and friends when at eleven o'clock he passed away.

with the Society he established there on ceasing to be Secretary of the Southern Section of the National Carnation and Picotee Society.

His interest in the cultivation of the Carnation and Picotee gained for him a widely extended fame, and he will be remembered amongst amateur and professional florists as the raiser of a large number of standard varieties with which most of our readers are probably familiar. He was a contributor to the gardening Press on matters that concerned his views or practice in the pet object of his latter life, and was the author of a handbook on the cultivation of his favourite flowers.

Mr. Dodwell leaves a widow, four sons, and four daughters. Two of his sons, we understand, hold appointments in Hong Kong.

NEW CHRYSANTHEMUMS.

FOLLOWING the practice I have adopted for several years for the benefit of readers of the Journal of Horticulture, I will describe some new varieties as I have seen them, in the hope that the selection may be of service to persons who have not the opportunity of seeing them at shows or elsewhere. The advantage that an exhibitor gains in having all new varieties of merit is well known, and no matter how well grown a certain variety may be, it cannot compete with others of superior character. An example or two will suffice to show what I mean. A few years since Elaine was regarded as the best white in the Japanese section, but with the advent of Avalanche, Elaine could no longer hold its position, and gradually dropped out of premier place. Now we have another that will oust this favourite. I allude to Mdlle. There'se Rey, which is undoubtedly the finest white Chrysanthemum in existence, new or old. The advantage, then, of being in possession of new sorts of approved form is obvious to all who make exhibiting a feature-Varieties under different forms of cultivation vary somewhat in character, not only in the formation of their florets, but in colour also. For this reason the descriptions I append to each may not in all cases agree with catalogue definitions. I base my opinions on the flowers as seen.

INCURVED VARIETIES.

These appear to be fewer in number than usual, not a single sport having come under my notice during a lengthened tour and of visits to the most important shows and growers. This is to be regretted, as in spite of the number of varieties belonging to this section exhibitors at times find it difficult to stage thirty-six distinct varieties at one time. This section affords so little scope for variety of form that it is only in the matter of colour where we can obtain variety.

Vice-President Jules Barigney .- This was raised by M. Délaux, presumably from seed, and sent out first under the name of President Carnot, on trial. In colour it is chestnut suffused with buff. Catalogue description gives it as being rich crimson on the inside of the florets, but this is misleading, as it is not that part of the floret we wish to see. Unfortunately the blooms do not possess much build, but where variety

is required this sort may prove useful.

Malle. Martignac. — This is presumably another French-raised variety, possessing a much-needed colour, rich yellow. Unfortunately though the blooms are not very deep, the florets are short, but incurve

Miss Drover. - A seedling, possibly of American origin, introduced by the Messrs. Drover. An excellent bloom of it was staged by them at Sheffield, and also at Portsmouth. The florets are pointed and pearly white, a good middle row bloom. Unfortunately, though, in growth the plant is exceptionally tall.

Brookleigh Gem.—Sent out last year, is a deep lilac sport from Jeanne d'Arc, having all the characteristics of its parent in habit and

form. Many good blooms of it have been seen this year.

Lord Rosebery.—An English seedling raised by Mr. R. Owen. In colour and form it much resembles Violet Tomlin, purple violet in colour, but is larger than that member of the Princess of Wales family. Figured in the Journal of Horticulture for November 23rd, page 471.

Robert Petfield-—Presumably a sport obtained a year or two since, but not yet sent out. The stock is in the hands of Mr. R. Owen, who it is hoped will let the public have the benefit of this sterling novelty early next year. Blooms this season have freely borne out the high opinion I formed of it last year. In colour it is deep lilac with faint purple stripes. The florets are pointed and incurve thoroughly. As a middle row bloom Robert Petfield will be in great request.

Lucy Kendall.-A sport from Violet Tomlin, sent out last season by Mr. Owen, has quite come up to expectation, giving exhibitors quite a new colour. The centre of the florets are deep purple, the tip of each is

gold, which passes away with age.

Oeta.—An American-raised variety of promise. From crown buds the flowers are yellow with just a trace of bronze suffusion. From later formed buds the florets are bronze; unfortunately the blooms then are thin, lacking that substance which is necessary to make a perfect incurved bloom.

Baron Hirsch.—This variety has been plentifully shown this season, being freely produced, but it lacks quality, the petals being too erect to be termed quite first-rate.

Miss Bella Wilson.—As I concluded last year, this variety is too pointed in its petals and too coarse in the bloom to ever become popular as an exhibition variety.

Comte de Paris.—By many this variety is confused with the

Japanese Marquise de Paris. In form it partakes somewhat of the style of Jeanne d'Arc; pure white in colour, with just a tinge of blush about the base of the flower.

JAPANESE VARIETIES.

These are more numerous than in any year previous, and many excellent varieties have been obtained, which will improve the exhibitor's

stand considerably.

Malle. Therese Rey.—This must have the post of honour, it being one of the finest introductions of recent years. All other white varieties for exhibition pale before this French-raised seedling of M. Calvat. Well developed blooms measure from 7 inches to 8 inches in diameter, and are of corresponding depth, a point which renders this variety valuable for exhibiting. The florets are of medium width, and incurve slightly at the tip until fully expanded, when the point gives a little twist. The flower is white, with a faint tinge of cream in the unfolding florets. In habit of growth nothing could be more desirable; the foliage is especially robust, blooms appear to come full sized on rather weakly looking stems, which is a proof of its freedom. A bloom of this variety was illustrated in the Journal of Horticulture for November 16th,

page 449.

President Borel.—The colour is rose-magenta, the reverse pale gold, which is very perceptible in half-opened blooms. The florets are flat and of medium width, the flower being large enough for any purpose. I should advise exhibitors to add this to their list without delay

Louise.—This belongs to the type of incurved Japanese, and is one of M. Calvat's latest introductions. Not only is it a desirable acquisition for the cut bloom stand, but growing only 2 feet 6 inches high, and producing extraordinarily fine blooms, it must be indispensable for grouping purposes. The colour is flesh pink, and quite unique in that

Charles Davis.—This is a grand acquisition. Being a sport from Viviand Morel is of approved habit of growth, giving full sized exhibition blooms from plants 3 feet 6 inches high. The bloom varies much in its colouring, according to the date of "taking" the buds. Those formed early develop soft yellow blooms, while later ones give canary yellow flowers, beautifully tinted with rosy bronze. The blooms are fully 7 to 8 inches in diameter, and of corresponding depth.

Madame Edouard Rey.—Early buds of this open pale lilac in colour, being spotted and suffused with rose; those from later buds have more colour, warm rose pink. The florets are broad, incurving at the tips. The flower is full size, and a valuable addition to the exhibitor.

Eda Prass.—An incurved Japanese, though some blooms when fully developed lose that form. It is a desirable variety, and the colour is

pleasing, being a warm peach tint.

Mrs. Charles Cox.—A sport from Mons. Bernard, possessing all the characteristics of its parent in formation of flower. The colour is golden, base suffused with red. Blooms developing from late buds will exhibit a richer tone of colour.

Dr. Mrs. Ward.—An American-raised variety, having broad florets; the tip of each recurves, giving the flower a novel appearance. The surface of the florets is golden amber, which is fully displayed; the edge

of each is brick red. A striking novelty.

Miss Watson.—A desirable variety for grouping, being especially pleasing in point of colouring—a warm shade of yellow. In formation the flower closely resembles Avalanche. As a front-row bloom it will be useful to the exhibitor, but as a decorative variety it will prove

Miss Dorothy Shea.—Although sent out last year, it was only during the present season that this variety was seen in its true character. believe this variety supplied the finest individual bloom that I saw this season in a rather extended tour. The bloom in question was fully 8 inches wide and 7 inches deep, and was quite full in the centre. The colour is a rich terra cotta, with buff reverse. The petals are rather

narrow and smooth. An exhibitor's variety.

Princess Victoria. — This is one of Mr. Seward's English-raised seedlings, and represents a good type of flower. The florets are of medium width, slightly twisted at the points. Colour creamy white, flushed rose at the base. A full solid flower. The habit of growth is all that could be desired.—E. MOLYNEUX.

(To be continued.)

CERTIFICATED CHRYSANTHEMUMS.

On Tuesday last the Floral Committee of the National Chrysanthemum Society held a meeting at the Royal Aquarium, when Mr. George Gordon occupied the chair. Considering the lateness of the meeting, some meritorious flowers were staged, and first class certificates were awarded as follows:

Judge Hoitt (Mr. H. J. Jones).—A large Japanese Anemone variety with quilled incurving ray florets of a rosy blush tint, rather a flat disk

of pure white.

Col. T. C. Bourne (Mr. R. Owen).—A Japanese variety; very long flat florets of a rich rosy wine-coloured crimson, with reverse of old gold.

Lord Rosebery (Mr. R. Owen).—An incurved bloom of good size and

very solid. The colour is a deep rosy purple.

There were several other Chrysanthemums which the Committee desired to see again—viz., Mrs. Smith Ryland, a Japanese incurved, with large broad florets, crimson inside, a large solid flower; Mrs. Dr. Ward, a Japanese incurved hairy variety of good size, colour yellow and bronze; Mr. H. Jackson, an incurved Japanese of deep golden yellow; Mr. C. R. Bessent, a white incurved Japanese, with florets of good substance, and a very compact bloom; and C. B. Whitnall, an incurved

flower of American origin, colour deep purple crimson.

Some small but curious thread-petalled flowers, said to have been sent from Japan, were also staged by Mr. Morter, to whom a vote of thanks was accorded.

CUPS AND TUBES.

THOUGH we have cups and tubes of improved patterns "the Perfect" has yet to come. We want a cup with a spring or clip in the neck that will catch the stem of the flower when drawn down, and hold it securely and firmly in position. Especially is the want felt with incurved blooms, for pinning the stem with a cork wedge does not give satisfactory results. Some of them are sure to get loose, and by the time you reach "the halls of judgement" they are wobbling about.—E. K.

HAIRY CHRYSANTHEMUMS.

I HAVE been expecting to hear something about these new candidates for public favour, and have kept a rather keen look-out for them wherever I have been this season. There have, however, been so many of the other sections shown in fine form that hairy varieties, or at least the newest of them, seem to have escaped anything like marked Everybody is now fairly well acquainted with the older sorts like Mrs. Alpheus Hardy, Louis Boehmer, L'Enfant des Deux Mondes, W. A. Manda, and a few others, that nothing need be said concerning them. But some notes of a few of acceptable to those interested in the new class. But some notes of a few of the novelties may be

Hairy Wonder is a Japanese incurved bloom of a deep bronzy yellow, with numerous hairs on the reverse of the petals; and another, called King of the Hirsutes, which I saw at the Aquarium in Mr. Jones' stand, is also a yellow, which, in the uncertain light of that building, seemed to approach too nearly in form and colour to W. A. Manda. Sautel, 1893, is probably the best, for it is larger in size than most of those in 1893, is probably the best, for it is larger in size than most of those in its class; it has deeply grooved incurving florets of a light rosy amaranth inside, with a pale pink silvery reverse. Chrysanthemiste Delaux is not pretty, although distinct, is a dull bronzy crimson. Mireilli is also a Japanese, the colour pale lilac. Souvenir de l'Ami Coye is better in several respects, being a pure white Jap of the incurved type, with narrow pointed florets and plenty of hair on the reverse. Belle Arlésienne, like the four preceding, comes from France; it is less hairy than the others, but the colour is clear and good, being pure white, with a delicate shade of yellow in the centre. William Falconer is a pretty pale blush sport from Louis Boehmer, a more refined looking flower than the parent. This was raised in America, where it is also known, I believe, as Patrick Barry. Mrs. Dieterichs is probably from the same country, as Patrick Barry. Mrs. Dieterichs is probably from the same country, the florets incurve, and the colour is a clear silvery shade of mauve. Miss Baldwin is rather a flat flower, very tall in growth, the colour pale mauve or amaranth. There are about twenty other sorts announced in the cotalogues but the above ere all I have seen worth montioning. the catalogues, but the above are all I have seen worth mentioning.-P.

POMPON FLORENCE CARR.

PROBABLY never in any season has there been more Pompon Chrysanthemums shown than during the current year, for at all local shows they have been well represented, while at the "National" Exhibition they were shown in abundance. With the exception of one or two cases they were all of very high quality, showing that they are becoming more popular, and as the varieties are not very extensive any good sort would be much appreciated, and that I think we shall find in Florence Carr. This is a variety raised by a Mr. W. Carr of Crowdon in Florence Carr. This is a variety raised by a Mr. W. Carr of Croydon, who exhibited it at the show held in the Royal Aquarium, Westminster, where it was commended; it received a first-class certificate at the Crystal Palace this year. The colour of this new Pompon is of a deep bronzy red, flower of large size, fine substance, and the plant a dwarf habit of growth, something after the style of Mdlle. Elise Dordan. I do not know whether this Pompon is being sent out; if not, I hope it soon will be. Perhaps some of our readers will be able to give us their opinion about it.—GROWER.

INCURVED JAPANESE CHRYSANTHEMUMS.

Where any society is affiliated to the N.C.S. the duties of judges are clearly defined in the matter of nomenclature, and their duties in this respect are rendered quite easy. Varieties that do not correspond with the published description of each in the official catalogue must of necessity be disqualified. In the case in point (page 497) the judges ought to have exercised their powers in disqualifying Léon Frache and Mdlle. M. Hoste, as they are clearly not recognised as incurved Japanese. The latter was introduced by Lacroix, 1891, and except a few florets from early formed buds the blooms cannot be termed incurved at all. Léon Frache opens with an inclination to incurve, but this eventually Léon Frache opens with an inclination to incurve, but this eventually passes away, leaving the florets quite flat. Now that this section is increasing so fast varieties that remain incurved when fully developed only ought to be admitted. For instance, Robert Owen is a true type of incurved Japanese. of incurved Japanese.

Where judges have no definite law laid down for their guidance, as in the case of new varieties, it is then rather embarrassing for them to be called upon to make a law applicable to certain varieties.—E. M.

CHRYSANTHEMUM CATALOGUES.

MAY I be allowed to point out a very important matter in connection with the new Chrysanthemum catalogues which does not seem

to have entered the minds of our principal growers? In these days there is a large number of persons interested in tracing the origin of some of the new flowers and of discovering the age, raisers, and names of some of the older ones. A set of old catalogues of any of the principal Chrysanthemum importers would afford much interesting material of this sort, especially if they could be bound up together in a neat handy little volume. With the lists of most of the leading firms this is impossible, because every two or three years they alter the sizes of their lists, with the obvious result that after lying about for a time they become dog-eared, the wrappers torn, and are little better than waste paper. If some of our trade growers would only do as the late Mr. John Salter, or as Messrs. Dixon did-keep their lists to one size-many of us would, I am sure, carefully place them aside year by year and have them bound up for future reference and instruction. This is a plan I have adopted for some years where possible, but unfortunately several of our leading trade growers and importers will never be represented in my set of Chrysanthemum catalogues because of the frequent changes they have made in their lists.-P.

MR. MAWLEY'S CHRYSANTHEMUM ANALYSIS.

WHILST all must concede that Mr. Mawley has in the preparation of his Chrysanthemum analysis, published in the Journal of Horticulture for November 30th, shown great patience many persons will ask of what use is it when it is published? The figures given of the number of blooms shown at the Royal Aquarium November shows are interesting, in so far as they exhibit the rise and wane of exhibitors' enthusiasm. Starting low in 1885, rapidly rising for the next three years, falling to zero in 1889, then springing up most spasmodically to more than double the number of the previous year, then coming down again gradually to a low ebb in 1892, when many exhibitors doubtless having the measure of their quality wisely retired from a competition at which only the very best blooms can win. Still even these figures are of no appreciable value to the present day grower, whilst the long lists of varieties that have been popular in past days read simply as old history, for to-day already three-fourths of the Japanese mentioned are as good as dead and buried.

In the case of the incurved forms they move so slowly that change is far less in their case in ten years than in the Japanese in one year. Now, what would be far more useful as well as interesting, would be selections made by bona-fide private growers and exhibitors of say twenty-four of the best Japanese selected from their own or other boxes of the past show season. With exhibitors it is most important to learn of the past show season. With exhibitors it is most important to learn not of old and now shunted sorts, but of the very best present day varieties. I should rigidly exclude from the growers who may be invited to join in this selection—and some twenty-five to thirty would be ample—all trade growers. The object should be to secure impartial returns of the very finest varieties, each one being placed on the list by the sender in the order in which he regards it as meritorious.

It is so very obvious that whilst this season we have seen fully one half of the places in good class boxes occupied by new or practically new varieties that next year that proportion will be extended to fully

new varieties, that next year that proportion will be extended to fully two-thirds, almost the only so-called old varieties, perhaps, being E. Molyneux, Avalanche, Sunflower, Viviand Morel, W. H. Lincoln, and Etoile de Lyon; and of these how many will be found in first-class stands two years hence? It is this great swiftness to displace older good sorts that presents such a terror almost to exhibitors. They cannot, if sorts that presents such a terror almost to exhibitors. They cannot, if they wish to be in the front ranks, refrain from obtaining the best new sorts, but they do not want to purchase varieties that have either not been seen or may prove worthless. It is in this respect that high-class selections by leading private growers would prove so helpful.

Whilst we do undoubtedly derive splendid varieties of Japanese Chrysanthemums from seed, and for such a facile means of obtaining

variations we ought to be grateful, yet is it in danger of becoming something of a nuisance, because it is at once so difficult and so costly to keep pace with novelty production. Only last week there were at the Drill Hall and the Aquarium no less than eight Japanese varieties certificated, and at the preceding meetings on November 7th and 14th at the same place nine other Japanese were certificated and several others had been certificated previously, so that altogether some twenty-five at least have been so honoured, and another twenty-five have come so near to honours as to show that they have if well grown high merit. What wonder is it if in such case a selection becomes bewildering ?—A. D.

THE RIGHT BUD.

This is the most perplexing question a Chrysanthemum grower can out to me. I get this question from all parts of Scotland, Ireland, Wales, and England, but it cannot be answered without some consideration. First, as to what part of the British Isles does the question come from? What time of the year were the cuttings rooted? How were they treated after rooting? When were the plants potted? Were they ever topped, pinched, or cut back?

Before a correct or final answer can be given all the above details must be taken into consideration. The "right bud" for southern England is the wrong bud for northern districts, and the same applies to Scotland. The grower should be the best judge. He should study his locality; the time the blooms are required; whether the variety is early, medium, or late. No hard and fast rules can be laid down. The seasons vary so much; the treatment of plants varies equally as much. Therefore, no definite answer can be given to this question. Many growers profess to know the exact bud to select, and when to select it. I do myself, but only for my own locality, not for Great Britain.—R. O. M.

IN IRELAND.

It is very kind of "Taddy" (page 497) to refer to me and my visit to Ireland. I can assure him that I am not so unfavourably impressed by what I saw as he imagines. True, I did not find Chrysanthemums in that condition that would enable their owners to be bold enough to cross over to England and "sweep the decks" of the best prizes at the leading shows. The same remark applies to other countries, where I have gonc upon the same errand, therefore this may be some consolation to Paddy."

If I did not find Chrysanthemums in the condition your correspondent thinks they should have been upon this occasion, I found several things that cannot be excelled in England, viz. enthusiasm coupled with a desire to emulate the successful, and a hearty acceptance of defeat without the slightest attempt (publicly), and far as I know privately, to cavil at the awards or to entertain acrimonious feelings towards the successful exhibitors. This is a trait in the character of an exhibitor to be proud of, and one that could with advantage be copied by not a few on this side of the Channel.

I did not expect to find Chrysanthemums of the highest order of merit, therefore was not disappointed. The date was rather late for the finest blooms to be seen, and this is some excuse. I knew that the exhibitors were mainly amateurs, but from blooms that were staged at the show, "not for competition," that had a few days before won prizes at the exhibition of the R.H.S. of Ireland held in Dublin, I could very well gauge the Chrysanthemums produced in Ireland, and I would advise English cultivators not to rest on their laurels or they may find a "dish" of Irish-grown blooms set in front of them upon an English exhibition table that might be "humiliating" to the latter. If the blooms at the Dalkey Show were not entitled to rank as first-class, it is only fair to the cultivators to say under what conditions some of these said blooms were produced. Especially do I allude to the exhibits of the worthy Hon. Secretary, Mr. J. M. Ross, who last year fairly "cleared the board," but this season was not so fortunate, while his successful rival, Mr. J. Smallman, took all before him.

To return to Mr. Ross and the difficulties he has to encounter in growing Chrysanthemums. Rarc-an-ilan, the residence of Mr. Ross, is situated on the edge of a cliff in Dalkey Bay, facing east, about ten miles from Dublin. The house is but 40 feet above sea level, and within that distance from the sea at high water. During the storm which prevailed on the 18th, three days before the date of the show, it was not possible to see through the dining room windows. The glass was thoroughly encrusted with the salt deposit from the spray which was lashed against them by the fury of the gale. Within 20 feet of these windows, and facing south, stands the greenhouse in which the blooms unfolded their The summer quarters of the plants are situated on the western side of the house, and but 60 feet from the said dining room windows. So enthusiastic is Mr. Ross about his Chrysanthemnms that for the summer quarters he has appropriated part of his lawn, so that they might enjoy more space than hitherto. What would our leading English exhibitors say if they were told to produce blooms equal to their present standard under similar circumstances? Surely this is Chrysanthemum culture under difficulties. When these facts are known I doubt not but that Chrysanthemum growers generally will agree with me that "Paddy" need not take so desponding a view of my first impression

With regard to the Show itself the competition was very keen. Specimen plants were really well shown, and would have done credit to many English meetings. The class for nine distinct specimens brought out three exhibitors. Mr. Tower, gardener to J. E. McCormick, Esq., Monkstown, Co. Dublin, was an easy first with plants from 3 feet to 4 feet high, not formally trained, but carrying on an average thirty to forty blooms each, and of really good quality. Mr. W. M'Comas, The Grange, Monkstown, was a good second. In other classes for plants Mr. J. Smallman, Shamrock Lodge, Dalkey, was the principal prizetaker with excellent examples of W. Holmes, Etoile de Lyon, Mdlle. L. Leroy, E. W. Clark, and Source d'Or. So numerously were plants staged that a tent had to be requisitioned at the last moment, the Town Hall not being nearly large enough to contain all the exhibits. This is the first time that I have seen Chrysanthemums shown under canvas.

The cut bloom classes were well represented. In the open classes for cut flowers, Mr. Knowldin, gardener to J. G. Nutting. Esq., Gortmore, Dundrum, was the principal prizewinner, his exhibits being much in advance of any other, the blooms showing good culture, and were neatly staged. Mr. Smallman won several first and second prizes, his blooms of Florence Davis, E. W. Clark, Viviand Morel, Col. B. Smith, Golden Empress, Violet Tomlin, Queen of England, Lord Wolseley, and Jardin des Plantes were really creditable. The Anemone blooms from Mr. Robert M'Mullen were quite up to English form, being full in the centre and neatly staged. Prizes were offered for baskets of Chrysanthemums arranged with Ferns and other foliage. Several commendable exhibits were forthcoming, the best coming from Mrs. Findlater.—E. MOLYNEUX.

NATIONAL CHRYSANTHEMUM SOCIETY.—ANNUAL DINNER.

THE members of the National Chrysanthemum Society held their annual dinner at Anderton's Hotel, Fleet Street, E.C., on Thursday evening, November 30th, and, as on previous occasions, resulted in an enjoyable gathering. Sir Edwin Saunders, President of the Society, occupied the chair, and he was supported by many influential gentlemen interested in the culture of the Chrysanthemum. About 140 persons

sat down at the tables, and amongst others present we noticed Dr. Low, Professor Aguilar, E. Trimmer, Esq., S. Hutchinson, Esq., W. F. Forsyth, Esq., Ashley Gibbings, Esq., J. G. McKinlay, Esq., C. E. Shea, Esq., J. Halse, Esq., J. W. Wilkinson, Esq., J. T. Berridge, Esq., Messrs. C. E. Pearson, R. Ballantine, C. H. Payne, T. W. Sanders, D. B. Crane, H. J. Jones, R. Owen, S. Mortimer, and many well-known horticulturists. The room was tastefully decorated with large Palms and other foliage plants kindly lent by Messrs. E. D. Shuttleworth & Co., Albert Nurseries, Peckham Ryc, and the tables were embellished with flowers sent by Messrs. T. Bevan, G. Langdon, H. Cannell, and others. The arrangements were carried out in an efficient manner by Mr. R. Dean.

Sir Edwin Saunders, after the customary loyal toasts had been rendered, proposed the toast of the evening, "The National Chrysan-On rising the Chairman observed that he was sure themum Society." the toast would meet with a ready response. He thought it might with great propriety be termed "Continued Success to the National Chrysanthemum Society," inasmuch the progress made during the past few years left nothing to be desired. In proof of this he would give a few statistics which had been placed before him. Already 150 new members and twelve Fellows have been elected during the present year. (Hear, hear.) In addition to this fact nine more societies were recently affiliated. The growth of Chrysanthemum societies in Australia and at the Cape was a stirring instance of the popularity of this flower. Regarding the exhibitions held under the auspices of the N.C.S. during the present year, he might say that these had been most successful, not only in the extent of the exhibits, but the quality of the flowers. It was acknowledged by experts that some of the Japanese blooms staged at the October Exhibition rivalled those generally seen a month later. The November Exhibition was one of the finest the Society has ever held, there being nearly 500 entries. The meetings of the Floral Committee in October and November had been the means of bringing together a large number of new varieties, showing the increased interest taken in the Chrysanthemum by various raisers. They had received flowers for examination from the continent and other parts of the world. Early in the present year the Society sent, as they were well aware, blooms frozen in ice to New Zealand, and he had reason to believe they created much interest there. The educational work of the Society, including the papers read at conferences and meetings, had played an important part in disseminating a love for this flower. He considered this was a record of which those who were mainly instrumental in bringing it about may justly be proud. The Society was established at a period when the Chrysanthemum was not in very good favour, but it has made marvellous progress, and he ventured to think that the world was greatly indebted to the N.C.S. for the wonderful improvement made in the flower. (Hear, hear.) While occasional spasmodic exertions of a few growers may be useful, it was to the emulations of exhibitions held under the auspices of the Society that one must look for advancement. He viewed the Chrysanthemum from three points -æsthetic, educational, and commercial. In the first he included the improvements in size of flower, form, cultural details, to say nothing of the numerous insect pests with which growers had to contend. Then the arrangement of the flowers was an important feature, seeing that colours were not brought into juxtaposition, but blending them harmoniously. With reference to the second point, he had already remarked upon the educational work being taken forward by them; and as to the commercial side of the question, he hardly dare tread upon that ground further than saying that the trade growers merited all that could be said in their favour, whether they be actual or potential millionaires. (Laughter.) The Chairman concluded by remarking that the Chrysanthemum, as we now see it, was a modern flower, and he doubted not that the ancient Romans would have given much to have possessed such splendid blooms as were so plentiful now for decorating the tables at their banquets. (Applause.)

Mr. R. Ballantine gave the next toast, that of "The Affiliated Societies," and in doing so remarked that they had been a great strength to the National Chrysanthemum Society. When the idea was started eight years ago fifteen societies became affiliated to the "National," and they had gone on increasing by leaps and bounds until there were now 102 affiliated societies. Many of these were in Wales, a few in Scotland, and, he was glad to say, one in Ireland; there was also one in the Cape, but the greatest pleasure of all was in announcing that they had ten affiliated societies in that "England over the sea"-Australasia. They had been favoured with the presence of representatives from such societies on these occasions, and he well remembered the centenary festival when a lady representative from Tasmania was present. The result of this, and the excellent manner in which their indefatigable Foreign Secretary, Mr. C. H. Payne, carried out his arduous duties, was that the Chrysanthemum had increased in popularity in the colonies. It was from New Zealand that they received the first consignment of frozen flowers, and he had the pleasure that of assisting to reciprocate by despatching some frozen blooms from one of their exhibitions. These flowers had been exhibited in New Zealand and several parts of Australia, and were much appreciated. He was pleased to couple with the toast the name of Mr. W. Ratchelous, who represented the St. Neots Society, which had won the challenge trophy for the third time. (Cheers.)

Mr. Ratchelous briefly responded, and said that although St. Neots was one of the smallest Chrysanthemum societies in the kingdom, most people would agree with him that it had been well represented at the exhibitions. The members of it had won the trophy three times, and he hoped the Society would win it again. It was specially gratifying to him to hear that there was an affiliated Society in Ireland, because he had

recently received a letter from an Irish gentleman, H. F. Smith Barry, Esq., as member of Parliament for their district, congratulating the

members of St. Neots Society on the success they had attained. (Cheers.)
Mr. C. E. Shea in giving "The Health of the President," said that in
Sir Edwin Saunders they had a President that was in sympathy with the interests of the National Chysanthemum Society. He presided at the dinners and at the conferences, and he was a gentleman of patience and endurance. He said that advisedly, because Sir Edwin had once read a paper of his (the speaker's) whilst he was away. He congratulated the Society upon having such an admirable President. The Chairman briefly responded, remarking that he should have pleasure in forwarding the interests of the Society.

Dr. George Walker proposed "The Vice-Presidents, Officers, and Committees of the Society," and briefly eulogised them. To the officers and Committee he said much of the success of the Society was due. They had a capital President, excellent Secretaries, and Committees that worked like slaves.

Mr. C. Harman Payne, the Foreign Corresponding Secretary of the Society, and Mr. H. Cannell responded.

The Chairman briefly rendered "The Visitors," to which Dr. Low responded.

Mr. J. W. Wilkinson, Secretary Royal Aquarium, gave "The Press," which toast was responded to by Messrs. E. Ranger Johnson and

B. Wynne.

During the evening the presentation of prizes took place, including the challenge trophy, Holmes' Memorial cups, and medals awarded to various growers for blooms and plants staged at the exhibitions during the present year. It was announced that owing to the generosity of the President the reserve fund now amounted to upwards of £50.

NATURE'S HELPS TO GARDENERS.

THE LACED-WINGED FLY.

As though to assist man in his labours, Nature has provided several checks on the multiplication of the aphis tribe, if we, in our ignorance, did not mar her efforts. Besides the larvæ of the Syrphidæ, referred to in the Journal of Horticulture for October 26th, page 383, there are other insects that help to lessen their numbers.

The larva of the lace wing fly (Hemerobius), see fig. 75, is a very voracious aphis eater, and consequently a most useful help to us gardeners. Not being in the shape of a maggot or grub—as it is a six-legged perfect insect to most eyes—the larva may perhaps often escape death, being considered harmless; but owing to its enormous jaws, certainly a third of the length of the whole body, it might by mistaking head for tail be thought a small earwig and suffer accordingly. Like the earwig we often see in half-folded leaves, it is brownish-grey in colour, and quick in movements. These larvæ are gormandisers, so much so as to induce the naturalist Reaumur to style them the lions of the aphis tribe. The jaws are peculiarly formed, so that the aphis held by them are speedily sucked dry and tossed aside. When fully grown they are speedily sucked dry and tossed aside. When fully grown they make a sort of cocoon, in which they remain many months before the chrysalis changes to the perfect fly. This is an insect of the dragon fly tribe, having four large very fine wings, beautifully veined, many of a pale bluish green colour; the whole insect is pale green in colour, and the eyes are like brilliantly burnished gold. Though its wings are large its powers of flight are very feeble; this renders it an easy prey to birds and children. Its smell is disgusting, and this probably earns death for it from those who do not know its great value in the economy of Nature. of Nature.

The eggs are very peculiar, whitish or pale primrose in colour, oval in shape, and are at the end of a long white stem from a quarter to half inch in length. These stems of the eggs are attached to leaves or to the smaller twigs, fifteen or twenty in close proximity to each other. The stem is both firm and elastic, so that when blown about they are rarely injured. They are said to form a dainty morsel for other aphis eaters—viz., some of the ladybird tribe. They are often found on the Privet.—Y. B. A. Z.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 28TH.

SCIENTIFIC COMMITTEE. — Present: Dr. M. T. Masters (in the chair), Prof. Church, Mr. McLachlan, Mr. Bunyard, Rev. W. Wilks, Dr.

Bonavia, and Rev. G. Henslow, Hon. Sec.

Pears and Fungicides.—With reference to the remedies suggested by Mr. Massee, Dr. Masters inquired of Mr. Bunyard as to his experience in their use. He replied that growers were frequently deterred from employing any poisonous preparations in consequence of the carelessness of the men from their want of realising the dangers involved in using them, so that they preferred to employ sulphur, and especially the "black" impurer sort.

Tamarix dimorphic.—Mr. Henslow remarked that the two species common in Egypt, T. articulata and T. nilotica, corresponded with the two forms of Casuarina exhibited by Dr. Masters at the last meeting, who observed that T. gallica not infrequently develops the two forms on

the same plant.

Sterculia nobilis, R. Br.—A fruiting specimen of this plant was received from Syon House. A synonym is Southwellia nobilis, of Salisbury's "Paradisus Londinensis." It has been known to fruit in this country, but Dr. Masters observed that it is rarely now seen. The

present tree is eighty years old, but never fruited before. Dr. Church observed that being closely allied to Theobroma cacao or Chocolate, it would be interesting to examine the seeds for theobromine.

Primula capitata and Basal Rot in Daffodils.—The following communication was received from Rev. C. Wolley Dod, Edge Hall:—"I have been engaged for several years in investigating that mysterious phenomenon, basal rot in Daffodils. The Scientific Committee have assured me (after repeated examination of bulbs sent by me) that no specific cause of it can be detected. I am inquiring whether there is anything analogous to it in any other plants—viz., death from general unsuitable conditions, commencing at the juncture between the root and the bud, and producing decay there, partial or entire. I have noticed some-

FIG. 75.—THE LACED-WINGED FLY (HEMEROBIUS). A, the Eggs; B B, the Larvæ; C, the perfect Fly, natural size; D, the same in flight.

thing similar in some Himalayan Primroses, especially Primula Stuarti. which I have ceased to cultivate because the base of the bud (I use bud in its botanical sense of crown from which the leaves sprout) is so apt to rot into pulp. In P. capitata, however, of which I have grown and flowered thousands during the last fifteen years, no winter bud is ever formed. Mr. G. Wilson tells me that in his garden at Wisley it is a hardy perennial, but with me it invariably dies if left out in winter. The tissues are not destroyed by hard frosts, for after a hard winter the leaves in the centre of the tuft often continue green in February, but rot seems to commence at the base, as in the specimens enclosed, and the open leaf tuft invariably rots off before spring, being often still green. I should be glad of an opinion whether the case is likely to be analogous to that of basal rot in Daffodils?" Mr. Wilks corroborated Mr. Dod's experience, as he found the plants died in a similar manner in his garden. The specimen was forwarded to Kew for examination.

Cuscuta reflexa.—A specimen of this parasite growing on Jasminum revolutum was received from Mr. F. W. Burbidge of the Tr. Col. Botanic Gardens, Dublin. He observes that "it does nearly as well on Forsythia viridissima and F. suspensa, as well as on Ivy. Indoors in a warm house, Pelargoniums, Fuchsias, and Crotons seem to suit it best. We had it growing on a Zonal Pelargonium which was placed in the Jasmine on a west wall last May, and it now forms a wiry net-like mass 10 feet high and 8 feet wide. It often twists upon itself." An examination of the suckers or haustoria showed that the Cuscuta often preyed upon itself whenever two branches were spirally twisted together. itself whenever two branches were spirally twisted together. As far as

a few observations can be trusted the roots of the thicker of the two stems always penetrated the other. It frequently fixed itself to the surface of the leaves of the Jasmine as well as around the stems and petioles.

Preserving Fresh Fruit in Carbonic Acid Gas.—The following communication was received from Mr. W. Sykes of Woodleigh, East Dulwich, being a description of experiments suggested at a meeting of the Scientific Committee on July 25th :- "On August 23rd I put down some Apples, Pears, Plums, Tomatoes, and eggs, but am sorry to say that, so far, my experiments with carbonic acid gas are unsatisfactory; neither does it appear to check the ripening or decomposition, and it gives the fruit a peculiar flavour. The Apples have a musty, coddled taste. With the Plums the gas centres round the stones. In the Tomatoes there is a sharp, forbidding, pungent taste throughout, which leaves them after standing twenty-four hours in the air. I allowed the gas to pass through the washing bottle into the tins, the natural air escaping through a pipe. After the fresh air had escaped (tested with a lighted match), I closed the latter pipe and let the gas work itself dead slow. After giving them all a good application (three dozen taking in both applications some six hours) I went through them again, opening the escape pipe mentioned above to scour out, then I reclosed it with pliers before closing the entrance pipe, the gas had worked dead slow, the top and bottom bulging out. The pressure at the gauge stood at 5 lbs. The water in the washing bottle was fresh boiled and put into the washer (just bearable) being changed for every dozen tins. I did not exhaust the air, and found with this test of a week that the Tomatoes were sweating equal to those kept for over a fortnight after the air was exhausted. Some Coryopsis, white Marguerites, and Nasturtiums were put under the same process (August 23rd). The first kept well, and after being in water looked none the worse; the white of the Marguerites turned to a pale chocolate beyond recovery, and the Nasturtiums collapsed into a withered heap." Professor Church observed that the failure might have been due to an insufficient time having been allowed for the atmospheric air to diffuse. He added that much carbonic acid had been proved to exist around Mangold roots when turfed over, which undoubtedly acted as a preservative.

GRAPES AND TOMATOES.

[Read at Hereford by Mr. S. T. WRIGHT, Gardener to C. Lee Campbell, Esq., Glewstone Court, Ross.]

THE CULTIVATION OF GRAPES.

In dealing with this subject my remarks must be brief, as time will not permit of an elaborate description of Grape-growing. A good start is important, and to insure that result perfect drainage is essential, as stagnant water is fatal to satisfactory results, so that if there is not a free drainage naturally, it should be provided; at the same time a heavy expense is unnecessary. A drain put down the middle of the border and covered with a foot of rubble will be ample; over this turves should be placed, grass side downwards; and if the soil is of a fairly appearance of the sould be placed. open character. I would not use anything but turf in making the border. If the soil is heavy, just sufficient lime, mortar, or plaster refuse may be added to keep the mass open and allow the water to pass away freely. My experience is decidedly against mixing animal manures with the soil for the border. It is not wanted, and it is very apt to cause the border to become sour, and the Vines more or less unhealthy in consequence. It is a mistake to make the border full width at first. Supposing it to be from 2½ to 3 feet deep, which is deep enough, a border 3 or 4 feet wide at first will be ample for the first two years, and after fruiting has commenced a foot more may be added until the allotted space has been filled. Opinions differ as to the best time to plant young Vines. I favour planting when the Vine is in active growth, disturbing the roots as little as possible, avoiding deep planting, but having the top roots of the Vine only 2 or 3 inches below the surface of the border, making the soil firm about the roots, and a thorough soaking of water applied at once. Liquid manure is seldom requisite for the first year, as it would probably cause a thick pithy growth, difficult to ripen, and thus a source of trouble in the future. What should be aimed at is a short-jointed, hard wood, with bold buds, that will be almost certain to give satisfactory results. Attention to ventilation, atmospheric moisture, and watering of the border is all-important to grow first-class Grapes.

Taking ventilation first, every practical gardener is well aware how the weather has to be studied, increasing or reducing the air admitted according to external circumstances. If too much air is given, so as to give the Vines a check, mildew sets in, or the Grapes refuse to swell properly, and if too little is given, scalding of the foliage occurs. To prevent such disasters a constant watch on the weather must be maintained, thus avoiding any rapid rising or falling of the temperature. On bright mornings a little air should be admitted early, gradually increasing it as the sun gets more power, and closing in the afternoon with good sun heat, while the Vines are growing. When the fruit begins to colour a little air should be left on day and night, but not allowing the temperature to become unduly low. After the fruit is cut plenty of air should be admitted, and the Vines kept as cool as

possible without becoming frosted. Atmospheric moisture is only second in importance to ventilation. As a rule Vines are started into growth at a temperature of 45° to 50°, with a thorough syringing of the rods twice a day, once in the morning and again in the afternoon when the house is closed. The border walls, and paths are also damped several times daily, and the

evaporating troughs on the hot-water pipes kept full of water. As the Vines come into bloom syringing them ceases, and a rather drier atmosphere maintained until the Grapes are set. If the Vines are in good health a sharp rap on the rods will cause the pollen to fly freely, and thus cause a good set. As soon as all the bunches are finished setting all the worst or smallest should be cut off, and a more genial atmosphere maintained, thoroughly damping the floors and borders early in the morning, and again in the middle of the day if bright, and again in the afternoon, shutting up with a good sun heat. If the temperature rises to 90° or 100° when closed in the evening, so much the better for Grapes, providing there is plenty of moisture, as it will cause the berries to swell rapidly, and also suit the foliage of the Vine.

Early thinning is of vital necessity if large bunches and berries are desired. In thinning, a space of about 1 inch will be ample for each berry, but for the smaller-berried varieties a little less may be allowed. The number of bunches each Vine should carry depends on its health and vigour and the size of the bunch. For a healthy Vine, I consider from 30 to 40 lbs. per rod of about 16 feet long a fair crop; with liberal feeding and good management such a group of Granes. with liberal feeding and good management such a crop of Grapes ought to finish well, and produce a similar amount annually.

The question of feeding is somewhat complex, as soils vary so much that manure excellent in one place may be of little value in another, owing to the different constituents present or absent naturally in the Therefore it is evident that Grape growers must ascertain what elements are lacking in their soil necessary to produce good Grapes, and when this deficiency is discovered it will be easy to remedy the defect. Judging from my experience in various parts of the country, I think the majority of Vines do not receive anything like adequate nourish-When we consider the Grapes, wood, and foliage taken every year from the Vines, it is apparent that a vast amount of plant food has been absorbed from the soil, and unless these elements are returned nothing can prevent degeneration setting in through exhaustion. Again, I think too much importance is attached to animal manures; all solid or liquid manures from cattle have a tendency to cause sourness of the border, followed by unhealthy root action. The best form in which to apply animal manures is in connection with artificial or chemical manures; if used with care, judgment, and a knowledge of the soil, splendid results will be certain, if combined with good culture in other

respects.

The following manures I have used with satisfactory results at Glewston Court on the light sandy soil there:—Liquid and solid manure from cows, liquid manure extracted from sheep droppings, fish guano, bonemeal, superphosphate of lime, and muriate of potash. The time of feeding is all the year round in the case of Vines under my charge; manure in some form is applied even when the Grapes are ripe, which does not affect the flavour at all, but greatly assists the Vines to bear the crop, helping also to develop the buds for next season. The advantage of winter feeding, or while the Vines are at rest, I consider of much importance, for though the root action is slight at that period the soil absorbs the plant food applied, and when fresh growth is made it is there in the most available form for the roots to take up as they require it; consequently the Vines start into growth in a most

gratifying manner.

Pruning is best done as early as possible after the foliage falls; in fact, I seldom wait until all is down, but, as soon as about four-fifths of the leaves have fallen I prune all side shoots to the first good bud nearest the main rod, which is usually the first or second eye. Young leading rods, if strong, may be pruned to within 3 or 4 feet of the old cut; a greater length of young wood is seldom advisable if the Vines are to crop for a considerable number of years. In concluding this paper on Grapes, I would strongly urge the importance of cleanliness. Insect enemies of all kinds must not be allowed a footing, and every effort should be made to keep the Vines free from attack, and the foliage clean and healthy right up to the time it falls. By doing so success is practically assured.

TOMATOES AND THEIR CULTURE.

In this short paper on Tomatoes, only the chief points connected with their management will be given. So popular have Tomatoes become, that nearly all classes have become consumers, and many acres of glass are devoted to meeting the demand for them. At the same time I question if all the Tomatoes sold as English are grown in this country; and many persons have been so disappointed at the flavourless fruit they purchased that they have decided to try to grow their own. To such persons I hope the following remarks may prove serviceable:—

If a moderate amount of heat under glass can be obtained, the early part of February is a good time to sow the seed, which should be sown rather thinly in a pot or pan containing fine and fairly rich soil. As soon as the seedlings appear they should be placed in a position close to the glass to prevent their becoming drawn. When the young plants are large enough to handle, they ought to be placed singly in small pots, making the soil moderately firm, and after giving a good watering placed near the glass again. Care must be taken that they do not suffer by want of water, otherwise they become stunted, and seldom do much good afterwards.

As the pots become full of roots, the plants may be shifted into a larger size, in soil composed principally of turfy loam and a slight addition of bonemeal and decayed horse droppings, still keeping the plants near the glass to cause a stout sturdy growth. The next shift, the plants may be transferred to large pots or boxes, using the same soil as previously named, and placing the plants in the lightest position possible, avoiding overcrowding. From one to three stems, according to room, can be trained up, pinching out all side growths as they appear;

and if the foliage is too thick half of each of the largest leaves should be

cut away.

No feeding with manures is required until the first truss of fruit is set; then feed as much as you like, as the fruit prevents any undue grossness. By heavy feeding the plants will continue bearing for months. At all times avoid a close, moist atmosphere, as it is almost certain to cause disease to set in. A warm and dry atmosphere with plenty of liquid nourishment suits the Tomato.

Outdoor Tomatoes should be sown in heat early in March, and kept growing sturdily from the first as before mentioned, gradually hardening the plants off in May, and planting them out in warm and sheltered positions at the end of that month, keeping the shoots far enough apart to prevent crowding, and shortening the leaves if necessary. A mulch of good manure, or an occasional soaking of the same in liquid form, when the plants are fruiting, will act very beneficially. At the end of August all further growth should be stopped, as fruit formed after that date will not develop properly; and it is better to throw all the strength of the plant into the fruit already formed. If any fruit is not ripened when cold weather approaches, it should be cut off with a good piece of stem, and hung up in a warm place where it will colour later on.

DESSERT TABLE COMPETITIONS.

AT the Hull Chrysanthemum Show there has been a challenge cup competition for a dessert table for many years past, the exact wording of the schedule being as follows: "Dessert table, 8 feet by 4 feet, completely laid out for six persons, only Chrysanthemums with any kind of foliage to be used in its decoration."

This year the first prize was awarded to a table having no dessert thereon, excepting one small dish containing about half dozen chocolates and another the same number of Almonds; there were also six plates, and knives and forks, in addition to the floral decorations, but no fruit or other accessories. On the one hand it is held that it is not the custom now to put the dessert on the table along with the floral decorations, and as this table was the best artistic arrangement as related to the use of Chrysanthemums and foliage, the prize was, from that point of view, rightly given to it.

On the other hand, it is contended that as there was no fruit or other accessories placed it did not comply with the terms of the schedule, having regard to the words "completely laid out," consequently must have been disqualified had a protest been entered. I shall be glad to know which is the correct view. Being a challenge competition not yet finished the wording of the schedule cannot be altered.—EDWARD

[We shall be glad to publish the opinions of table decorators and show judges on the subject indicated.7

ROYAL AQUARIUM FLOWER SHOW.

DECEMBER 5TH, 6TH, AND 7TH.

AN Exhibition of winter flowers, including Chrysanthemums, Cyclamens, and Primulas, was held under the auspices of the National Chrysanthemum Society at the Royal Aquarium, Westminster, on the above dates. There was an exceedingly good display, but owing to the dull weather that prevailed it was impossible to see the true colours of

the flowers, which were of excellent quality.

The principal class was for twenty-four Japanese blooms, and in this there were eleven competitors. The flowers were good, and a close competition resulted. Mr. E. Rowbottom, gardener to H. R. Williams, competition resulted. Mr. E. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey, won the premier award with a grand stand of blooms. The best of these were Mdlle. Therese Rey, Beauty of Castlewood, Empire, Pearl Beauty, G. C. Schwabe, Princess Victoria, Lizzie Cartledge, W. H. Broomhead, and Etoile de Lyon. Mr. W. Collins, gardener to J. W. Carlile, Esq., Ponsbourne Park, Hertford, was second; and Mr. H. Alderman, gardener to G. Hatfield, Esq., Morden Hall, Surrey, third. An extra prize was awarded to Mr. W. G. Gilbert, gardener to B. Le Neve Foster, Esq., J.P., Sennowe Hall, Guist, Norfolk. For twelve bunches of Japanese blooms, six varieties, Mr. C. W. Knowles, gardener to Mrs. Chas. Egerton. Solna. Rochampton, was first: and Mr. gardener to Mrs. Chas. Egerton, Solna, Roehampton, was first; and Mr. W. Tyster, gardener to Miss Smith Dorridon, Hartwell Villa, Aylesbury, second. The class for twelve Japanese blooms, distinct, was very keenly contested, there being seventeen competitors. Mr. J. Turk, gardener to P. Bosanquet, Esq., Penfield, Hertford, was placed first with fine blooms. Amongst them E. Molyneux, Pelican, Mrs. E. Beckett, and Mrs. E. W. Clark were the best. Mr. W. G. Gilbert was second, and Mr. Rowbottom third.

The flowers in the class for twenty-four bunches of any varieties of Chrysanthemums made a good display. Mr. C. J. Waite, Glenhurst Gardens, Esher, was placed first with a stand of blooms tastefully arranged. Mr. C. W. Knowles was second, and Mr. G. Smith, Floral Cottage, Hull, third. Mr. C. Cox, gardener to J. Trotter, Esq., The Grange, Brickendon, was first with six Japanese blooms, showing Viviand Morel, G. C. Schwabe, Mrs. E. W. Clarke, Beauty of Castlewood, Etoile de Lyon, and Robert Owen in splendid condition. Mr. W. Collins Etoile de Lyon, and Robert Owen in splendid condition. Mr. W. Collins was a good second, and Mr. H. Shoesmith third. Extra prizes were

awarded to Messrs. H. Alderman and A. Gibson.

Incurved blooms were well shown for the time of year. There were sixteen exhibitors in the class for six blooms, and the competition was exceedingly keen. The first prize was secured by Mr. H. Alderman, who

had fine examples of Golden Empress of India, Princess Teck, Lady Dorothy, Lord Alcester, Empress of India, and Barbara: Mr. H. Shoesmith was second, and Messrs. W. & G. Drover, Fareham, third. An extra prize was awarded to Mr. W. G. Gilbert. Mr. H. Shoesmith was first with twelve blooms, showing these in very good condition. The best were Princess of Teck, Lady Dorothy, Chas. Gibson, and Hero of Stoke Newington. Mr. W. G. Gilbert was second, and Mr. G. Smith third. For twelve incurved blooms in not less than six varieties Messrs. W. & G. Drover were first, Mr. Gilbert second, and Mr. H. Alderman third.

For six blooms, distinct, of any new varieties Mr. E. Rowbottom won, showing Le Verséau, W. H. Broomhead, Le Drac, Waban, Chas. Blick, and Mr. Hubbuck. Mr. A. Newell, gardener to Sir Edwin Saunders, Fairlawn, Wimbledon, was first for six bunches of six Japanese blooms. Mr. C. W. Knowles was second, and Mr. D. B. Crane, Highgate, a good third. An extra prize was awarded to Miss R. Debenham, St. Peter's, St. Alban's. The last-named exhibitor was first with twelve bunches of St. Alban's. The last-named exhibitor was first with twelve bunches of single Chrysanthemums, Mr. W. C. Pagram, Weybridge, second, and Mr. G. Smith third. An extra prize was awarded to Mr. J. Agate. Messrs. T. Lansley, E. Spurge, and F. Hicks secured the prizes for six Japanese blooms. Mr. W. Howe, gardener to Henry Tate, Esq., Park Hill, Streatham, was first for a group of foliage, berried, and flowering plants; Mr. Newell being second. Mr. D. B. Crane won with a vase of Chrysanthemums, and Mr. W. Cook with twelve Cyclamens.

Miscellaneous exhibits were numerous and made a charming display

Miscellaneous exhibits were numerous, and made a charming display. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, arranged one of the finest and most unique exhibits of Chrysanthemums ever seen in this country. Eleven handsome vases filled with splendid blooms and Mahonia foliage were placed on a large table with a few Palms for a background. The vase was filled in with Ferns, amongst which some Chrysanthemum blooms were dotted. Boxes of flowers were placed on the front, the whole making a feature that attracted much attention. A gold medal was awarded to Mr. Jones for his splendid contribution. Mr. J. H. Witty, Nunhead Cemetery, had a group of Chrysanthemums (silver medal); and Mr. G. Stevens, St. John's Nursery, arranged a table of blooms with Palms and Ferns. Mr. E. Rowbottom had a collection of foliage and flowering plants, as also did Messrs. W. Cutbush & Son, Highgate. Mr. R. Owen, Castle Hill Nursery, Maidenhead, sent a large collection of Chrysanthemum blooms tastefully arranged (silver-gilt medal). Mr. W. Wells, Earlswood Nurseries, also secured a similar award for a collection of Chrysanthemums arranged in a unique manner. Mr. J. R. Chard, Stoke Newington, had some table decorations (silver mcdal). Messrs. H. Cannell & Sons, Swanley, made a bright display with Zonal Pelargoniums and Chrysanthemums; and Mr. H. Perkins, Greenlands, Henley-on-Thames, won a silver-gilt medal for a collection of Amaryllis in fine condition. A first-class certificate was also awarded to Mr. Perkins for Amaryllis Charles Davis, a crimson flower with broad petals and a whitish green throat. Mr. C. J. Waite, Glenhurst, sent some magnificent vegetables.

Some new Chrysanthemums were exhibited before the Floral Committee, and certificates awarded for several varieties which are

described on page 514 of this issue.

FRUIT FORCING.

Peaches and Nectarines.—Earliest House.—The earliest house having been closed as advised in former calendars, fire heat should now be applied. The house ought to be freely ventilated even at night in mild weather, only using fire heat to exclude frost until the buds commence swelling, then 40° to 45° is quite high enough at night, turning on the heat in the morning so as to maintain 50° by day, night, turning on the heat in the morning so as to maintain 50° by day, with free ventilation between 50° and 55°, and full at and above the latter temperature, rising on bright days to 65°. Reduce the ventilation gradually, and close between 50° and 55°, leaving a little air on at the top of the house. Syringe the trees and every available surface morning and afternoon until the blossom buds are showing colour, after which discontinue syringing the trees, but sprinkle the surface of the border and path as before, so as to maintain a genial atmosphere. The inside path as before, so as to maintain a genial atmosphere. The inside borders will require to be watered with water not less in temperature than the mean of the house, making sure that every part of the soil is properly moistened.

Pines.—Young Plants.—Pits or small houses, properly heated and well ventilated, are most suitable for young stock. Successional plants often suffer irreparable injury at this season from being kept too close and warm, the plants becoming drawn and weakly. A temperature of 55° to 60° at night, with 60° to 65° in the daytime, will keep young plants gently growing, and they will not become weakly provided a little air is given at the top of the house at 65°, leaving it on all day. Do not let the temperature fall below that point, and when the sun raises it to 75° a free circulation of air should be allowed. Maintain a steady bottom heat of 80°. Avoid a very damp atmosphere, moderate humidity sufficing at this season. Examine the plants once a week for watering, applying it only when they become dry, and then give weak liquid manure in a tepid state. Keep the plants well up to the glass without touching it, and allow them plenty of room.

Providing for Fruit in May and June.—Where the means are limited considerable judgment and skill are required to maintain a successional supply of ripe Pine Apples throughout the year. There is no trouble where the successional plants can be counted by hundreds, but where the number is more limited the difficulty is to act so as to have the fruit come in at the right time. A supply of ripe Pines being required in May and June and plants are not showing fruit it will be desirable to select from those started last March which have completed a stout growth, have a thickened base, and are now resting, being guided in the selection by such as show the best indications of starting into fruit when subjected to a higher temperature both at the roots and in the atmosphere. The plants are best placed in a structure by themselves, but if this cannot be afforded assign them a light position in the house where the fruiters are swelling. A temperature of 65° at night, 5° lower in the morning in cold weather, and 70° to 75° by day will be ample at present in the fruiting department.

Cucumbers.—Winter-fruiting Cucumber plants are suffering from attacks of eelworm at the roots, this pest proving more disastrous than usual. This invisible (to the naked eye) foe gives no clear indications in the growth of the plants to an ordinary observer of the presence of the attack until the mischief is irremediable; but we advise subjecting all soil, especially turfy soil and animal manures, to a temperature of over 212°, but not so high as to burn or consume the fibry particles, before it is used for the plants, as a preventive. This we find infallible, but it is necessary to refrain from the use of vegetable or animal manures afterwards, and from any form of bone manure other than vitriolised, and rely mainly on mineral manures for sustaining the plants in health and fruitfulness.

Many failures, however, with winter fruiting Cucumbers arise from attempts at their culture in unsuitable structures. Cold weather necessitates heating the hot water pipes where there is a deficiency of heating surface to a temperature highly inimical to the plants by drying the atmosphere more than is good for the foliage, and where the pipes are in close proximity to the roots the soil is dried too much for healthy growth. The consequence is the fruits become stunted and swell indifferently, the plants falling a prey to insects. Air must be admitted very carefully, affording a little, however, whenever a favourable opportunity offers, but exclude it when the external air is cutting and cold. In bright weather, and the air sharp, turn off the top heat when the sun is powerful and likely to raise the temperature above 80°, for much sun heat before the turn of the day only accelerates growth which cannot be sustained. In such weather damp the house in the morning and afternoon, closing about midday or 1 P.M. Do not wet the fruit or the embrychic may damp off, and that formed become scabbed and deformed. Water will be required at the roots once or twice a week, and it should be equal in temperature to the mean of the house. A temperature of 60° to 65° at night, and 70° to 75° by day artificially is suitable.

The winter fruiting plants from the August sowing, and planted out in September, have grown to the extent of the trellis or nearly so, and are showing plenty of fruit. Only a few for Christmas and the New Year should be allowed to remain, and that on vigorous plants, as the plants will need all their strength to tide over a severe period should one occur, and fruit is most in demand during late winter and early spring. Attend frequently to stopping and thinning, also tying the shoots, avoiding overcrowding as one of the greatest evils. Remove bad and decayed leaves. Mildew is unusually prevalent this season, but it readily yields to dusting the foliage with flowers of sulphur or painting the hot-water pipes with a little sulphur. This also kills white fly, but aphides must be overcome by moderate fumigation on consecutive calm evenings. Subdue canker by rubbing quicklime into the affected parts, repeating as necessary.

Strawberries in Pots.—Although John Ruskin has proved as susceptible of attack from mildew in many places as its prototype Black Prince, it is highly spoken of in some quarters and grown extensively as a first early forcing variety. Where it or Black Prince can be had free from fungal pests there is a manifest advantage, as the fruit comes earlier, and is higher coloured and better flavoured than very early fruit of other varieties. The earliest fruits have commenced swelling, the crowns and the trusses are "peeping," and with them tiny aphides, which must be killed either by dusting with tobacco powder or fumigation with tobacco, or they will increase amazingly, and fasten on and spoil the flower buds. The temperature may be advanced a few degrees by day; a temperature of 50° to 55° being sufficient at night and by day in cold dull weather. A light syringing in the early part of bright afternoons will be advantageous to the plants. Examine the plants daily and supply water to all those that require it, but avoid making the soil sodden and sour by needless applications.

More plants should be placed in a house from which frost is excluded, the decayed leaves being removed, the drainage seen to and rectified if nccessary, the surface of the soil loosened, the pots washed clean, and a top-dressing of rich compost given. The plants will then be ready for introducing during the next three weeks to vineries and Peach houses being started, or a Strawberry house, assigning them a position near the glass. La Grosse Sucrée, Vicomtesse Hericart de Thury, President, and Noble are suitable varieties.

Plants for introducing later on will be quite safe in their quarters outdoors, plunged in ashes to the rim, and a light covering may be given

of dry fern or litter in severe weather, removing it when the weather is mild. If placed in frames, the plants should have the lights drawn off in mild weather, and in wet weather the lights should be tilted, for the plants cannot be kept too cool, nor must any be allowed to suffer for want of water at the roots.

THE KITCHEN GARDEN.

Vacant Ground.—In most kitchen gardens there is now a considerable amount of ground void of crops, and whether this shall be dug or trenched or made tidy for the winter ought to depend upon circumstances. Some soils would be greatly benefited by being early manured and roughly laid up to the pulverising influences of frost, winds, sunshine, and rains. Either double digging or trenching would be beneficial in other cases; while in not a few instances all such operations would be deferred with advantage to nearer cropping time. Soils differ so greatly in their constitution that it is almost impossible to lay down any general rules as to their proper treatment, as what would be right in one instance might be radically wrong in another case not apparently dissimilar.

Heavy Soils .- These naturally are of a decidedly clayey nature, and are usually most fertile under good treatment owing to their ability to absorb and retain both fertilising matter and moisture, but if mismanaged they are by no means so productive as medium and lighter soils. If there is too great a percentage of pure clay present in the soil, an early exposure to frosts may lead to this running badly and assuming the consistency of birdlime and the ground be very difficult of cultivation during the rest of the year accordingly. When former experience has shown that autumn or early digging leads to such results When former it should be discontinued till such times as it has been possible to well mix with the clayey soil a heavy dressing or repeated dressings of sand, ashes of all kinds, burnt clay, leaf soil, decayed garden rubbish, mixed with lime, well decayed tanner's bark, and such like. Once such materials get well mixed with clayey soil they will prevent it from running together again, and gradually convert the mass into an easily worked, very fertile soil. Have all or any of these materials collected, and later on wheeled on to the vacant plots, dig in with forks early next spring, or any time not long in advance of cropping, and while yet in a semi-dry state, breaking up the clods, and well mix the additions with the clayey soil by means of a course of chopping with two-tined or Canterbury

Heavy loamy soils, or those which do not contain more than 25 per cent. of clay, will usually be improved by being manured and roughly dug during the autumn and early winter, or long enough in advance of cropping to admit of pulverisation taking place. In some instances it has been found to answer well to dig before midwinter, and again early in the spring, thereby avoiding the risk of having a finely divided surface and great tough lumps underneath. On no account should heavy land be wheeled over, unduly trampled on, or dug during wet weather, or when water is standing on the surface, as this would of a certainty lead to its working very badly for at least one season, and most probably for some time longer. Either do the necessary wheeling over it during the prevalence of frosts, or else lay down planks to run on. Cow manure is about the worst kind that can well be used on heavy or clayey land, as it serves to make it still colder and more retentive. Horse stable manure only about half decayed is best for very clayey soil. Dug in freely now it will serve to keep the ground looser, and further act mechanically in breaking up the clay.

Medium and Light Soils.—When either of these rest upon a gravelly or chalk subsoil and naturally work freely without a long exposure to pulverising influences, it is not often a good policy to dig them now. Even if autumn or early winter digging has been found advantageous in former years, it would be yet unwise to manure them long in advance of cropping, as they are not sufficiently retentive to admit of this being done without the risk of the greater portion of the more soluble parts of the manure being washed down into the drains. Well decayed manure from farmyards best suits these non-retentive soils, the cow manure being most suitable for the lightest or least retentive soils.

The summer of 1893 proved exceptionally trying to crops on medium and light soils, their inability to retain moisture, owing to the absence of clay in their composition, being most marked. This failing should be remedied as far as possible in future years, a start being made at once by giving a dressing of either marl or clay. Make no attempt to divide the lumps, but distribute all thinly over the surface, trusting to the action of frosts to break them down, the mixing with the soil taking place early in the spring. This addition of clay or marl, and which latter may be defined as a mixture of clay and lime, soon has the effect of making light soils more retentive of moisture and fertility, and therefore more productive at all times.

Trenching.—In order to improve the depth of fertile soil, and to a certain extent be in a position to produce good crops of vegetables during a hot dry season, trenching should be resorted to according as the opportunities for carrying out this work properly offers. What is known as bastard trenching consists of breaking up the ground two spits or more in depth without reversing the positions of the surface soil and that immediately beneath. It is both the safest and best practice in all cases where the subsoil is of a clayey nature, and not previously ameliorated by having a variety of decaying substances, including strawy manure, vegetable refuse, and such like mixed with it. Bringing up a mass of poor soil to the surface, and burying that which has

by long cultivation been in a finely divided fertile state, is a most unwise proceeding. When, however, the surface soil has become manure-sick and inert it is greatly benefited by the addition of a small portion of the subsoil, that known as the "shovellings," or the loosened portion left after the first spit has been dug out of a trench, being quite sufficient for mixing with and correcting the surface soil. After having been broken up repeatedly and become well mixed with a variety of soluble and insoluble substances a clayey subsoil may be safely and profitably brought to the surface by the process known as trenching proper. Alluvial soils, or those that have been deposited by floods or overflowing rivers, are all of much the same character, sometimes to a very considerable depth, and in all such cases pay well for being trenched, the subsoil being made to take the place of what was previously the top spit. It need hardly be pointed out that shallow soils resting on a very gravelly or rocky bottom cannot be deepened by trenching, and should be added to as much as possible from the surface.

Ridging Soils.—The plan of laying garden ground up into ridges early in the winter is largely practised in some districts, but is not always the best course of treatment that can be adopted. In some cases the ridged soil breaks down very finely in the spring, but in the furrows the very opposite prevails, this being cold and sodden. Better by far in all such instances that ordinary digging, laying the soil up in rough spits had been done. Very stiff clayey soil may, however, in many cases be laid up in ridges with advantage, but instead of trying to arrange it in conical ridges it should be laid up squarely, the spits being disposed on the top of each other much as green bricks are dried, frosts and winds having then a good opportunity of thoroughly penetrating the spits.

PLANT HOUSES.

Chrysanthemums.—Whether good bushes or large blooms are required cuttings should be inserted where they can be obtained. It is better to wait for a time before insertion, rather than insert growths from the stem or poor puny cuttings. Those for large blooms if inserted singly in thumb pots, will root freely, even quickly, when placed under hand-glasses in a cool, airy house. When rooted under cool conditions the plants can be grown without subjecting them to heat. All that is needed is to protect them until they can be turned outside. Where large bushes are needed three cuttings may be inserted in each pot, and properly grown these will produce an enormous supply of flowers. For this purpose only free-branching and free-flowering varieties should be selected. The stools, after they are cut down, should be kept in a cool, airy structure until the cuttings have been taken; nothing is gained by placing them in heat. The plants often die, and the cuttings produced are weak, and sometimes fail to root.

Hydrangeas.—Varieties of H. hortensis that have been rooted in small pots, have prominent flower buds, and the foliage has ripened naturally, may be potted from time to time as opportunity offers. Pots 5 inches in diameter are most suitable, and the plants should be potted so that the first leaves produced are close to the rim of the pots. These plants do well if placed in good loam, one-seventh of manure and sand. Old Cucumber and Melon soil mixed together will grow them splendidly. After potting the plants should be kept in a cool, airy house for a time, when a few may be introduced into a vinery or Peach house that is just started, or any structure with a similar temperature. Plants that are kept for stock may be cut close back and rested in any cool place, and then started into growth under the conditions advised for those that have formed flower buds. Plants of H. paniculata grandiflora that were potted while their leaves were upon them will have formed some roots. The shoots may be pruned close back, leaving one or two eyes of the last year's wood. These plants do best if plunged in cold frames, and allowed to start naturally into growth.

Lilium Harrisi.—All plants that have been removed from ashes and have turned green should be placed on shelves close to the glass, where they will make sturdy growth. Be careful never to allow the plants to become dry, and watch for aphides, which are very liable to attack the plants in their points. Aphides are readily destroyed by fumigating the house or plants with tobacco smoke, or some of the various inventions provided for the purpose.

Cinerarias.—The latest plants of these should be transferred into larger pots and placed in a coolairy house, where they can come forward slowly. These, if cared for, and kept free from aphides, will be found useful when all the earlier plants are past their best. Do not allow plants that are well developed and throwing up their flower spikes to be crowded together so that their foliage will damp. Water during the early part of the day, ventilate freely on all favourable occasions, and do not employ more fire heat than is really necessary. Clear soot water, or other weak stimulants, should be given every other time the plants need water. Keep the plants standing on some moisture-holding base, or they are certain to lose their lower foliage, and if a dry atmosphere is maintained they are certain to be attacked by aphides.

Primula obconica.—Well developed plants will soon come into bloom if they are introduced into a temperature of 50°. If the blooms are required for cutting only they can remain in this temperature; if for the conservatory, they can be removed to that structure as soon as they are presentable. Plants that are required for later flowering may be kept cool in any light airy structure where the temperature does not fall below 45° at night.

Double Primulas.—Plants that are wanted in flower may be placed where the temperature ranges about 50° at night. They will

soon come into flower and continue for a long time. No attempt must be made to keep them in a close confined atmosphere, or they are certain to damp. A moderately dry atmosphere should be maintained with a little air on all occasions when the weather permits of it, ventilators being opened.

Justicia flavicoma.—This much-neglected plant will make the conservatory gay at this period of the year. When the first flowers are over the plants should not be cut back or thrown away, for they will flower a second and even a third time. Very frequently the second flowering is decidedly the best. The plants may be introduced again into warmth. When well grown the dark glossy foliage of the plant is attractive, and the contrast is very striking when large plumes of yellow flowers are produced.

APIARIAN NOTES.

HINTS FOR BEGINNERS.

The bee-keeper who intends to make his own hives must pay particular attention to the following instructions. White pine is sometimes used for hives, and it is the cheapest, but is the most worthless and least endurable. It is much affected by the weather, shrinking or swelling more than other woods. Where it can be afforded yellow or red pine should be preferred. The latter does not carry off the perspirations of the bees so well as the former, but the ventilating floor obviates all risks of injury from damp. Unless where boards are matched it is unnecessary that they should be well seasoned; but allowance should be made for shrinkage, which is about a quarter of an inch to the foot laterally only. Wood damped after seasoning swells to the same extent as green wood, therefore do not apply paint nor hinge parts together until the whole is perfectly dry, or decay is rapid, and the joint at the hinges will be open, which causes trouble. Reject all sap wood, and keep the heart of the wood outermost. Provide yourself with a few proper tools.

The instructions given are intended for amateurs and not tradesmen, as the two work on different lines. Where used boxes are available they should be secured if at a moderate price, and take care not to split the pieces when taking them asunder. Pretty section cases and supers can be made from many kinds of used boxes. Some of my hives are made wholly from such cases, including ironmongery, roof, and a dozen of supers or four-section crates, at a cost of 1s. 6d. actual outlay; paint, oil-cloths, and wrappings to be added.

Neatness is desirable, but is not absolutely necessary; but accuracy in sawing is the principal point. In sawing there are three kinds of cuts—"clearing" the drought, "riding" the drought, and cutting inside it. The use of the several cuts will be explained in a future issue. In order to work accurately, templates and measurers should be used.

Without oilcloths we should not get on very well. Summer is the best time to make them, but where a loft is accessible old ones may be spread flat, and with a brush given a coat of boiled linseed oil. No other kind of oil will do. New cloths may be steeped for several days in the oil after being washed, then hung up by one corner and allowed to drip, reversing the position at intervals until the oil begins to set, when they should be stretched out and suspended to dry. With these preliminary remarks I will close, hoping to be able shortly to give further instructions with diagrams.—A LANARKSHIRE BEE-KEEPER.

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Secretary, Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.— Secretary, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All

never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (H. J. C.).—You can obtain "Chrysanthemums and their Culture," by E. Molyneux, and "Vines and Vine Culture," by A. F. Barron, from this office. The former is 1s. 2d. and the latter 5s. 3d., post free.

Cherry Tree Wood (Cherry Blossom).—The wood of the Cherry tree is easily worked, beau tifully grained, and takes a fine polish. It was much sought after for merly by cabinet makers, turners, and musical instrument makers, but is not in particular request at the present time, as mahogany is readily obtainable in this country. Nevertheless, we have known good prices given of late years for sound trees, especially of the Wild Gean, which in some woods on chalk formations attains the dimensions of Oak trees, and is very clean in growth. Consult a timber merchant, or preferably a cabinet maker in a large way of business.

Mineral Constituents of Apple and Onion (E. W.).—The whole fruit of Apples contains about 0.27 per cent. of ash in 100 parts—potash, 35.68; soda, 26.09; magnesia, 8.75; lime, 4.08; phosphoric acid, 12.34; sulphuric acid, 6.09; silicic acid, 4.32; iron, 2.65. Onion ash, 0.46 per cent. in 100 parts—potash, 32.35; soda, 8.04; magnesia, 2.70; lime, 12.66; phosphoric acid, 15.09; sulphuric acid, 8.34; silicic acid, 3.04; iron, 12.29; chloride of sodium, 4.49. If the ammonia-forming substances are consumed, how can there be any nitrogen in plant ash? This, of course, is not what you mean, but the albuminoid in Apples only comprise 0.4, and the mineral matter 0.4 per cent. in 100 parts; and the albuminoides are 1.5, and the mineral matter 0.5 per cent. in Onions per 100 parts.

Sulphate of Copper Solution for Destroying Scale (D. H.)—The solution advised on page 327, October 12th, for cleaning incised and cankered wounds is far too strong to apply to the tender wood of Peach trees for the destruction of scale. It, however, would not injure thoroughly ripened wood, and certainly would destroy the scale, provided it was dislocated with a brush, avoiding injury to the buds. The solution, also, would act deterrently on the fungal germs. Try it on a few growths first, and if that does not prove injurious, the solution can then safely be used. For destroying the scale there is nothing better than 2 oz. each of caustic soda (98 per cent.) and commercial potash (pearlash) to 2 gallons of water, applying with a brush, wetting every part. If the wood is soft, dilute to 3 gallons; and apply in either case at a temperature of 120° to 130°.

The Movements of Leaves (Amateur).—You are right, spontaneous movements of leaves, or those in response to some direct irritation, are interesting. They have been subjected to close scientific study in the case of such as the Dionæa and Droseras with surprising results, the carnivorous plants having enjoyed a notoriety far exceeding the "Weather Plant," which was so much in evidence two or three years ago. The infolding of the leaf lobes in the Dionæa when some substance is introduced is familiar to many now, as also is the rapid drooping of the Sensitive Plant leaves when touched. There is, however, an occupant of the stoves in some botanic gardens which displays a still more remarkable phenomenon in its leaves, and which is not nearly so well known. This is the Telegraph Plant, Desmodium gyrans, a member of the Leguminosæ, and a native of the East Indies, and by no means a novelty. Though Mr. Darwin and others have determined that most plants have a spontaneous motion in their growing stems and roots, these are so extremely gradual that they are not readily observed, and can only be tested by careful experiment. In the Desmodium, however, we have a spontaneous movement that is visible and strongly marked. The leaves consist of three leaflets, the centre one large, oblong, or elliptical, and at the base on each side is a small narrow leaflet, which possesses a peculiar property. When the plant is healthy and growing these leaflets rise alternately by a series of little jerks until they are nearly perpendicular, and then descend in a similar way, to resume their action when the other leastet has gone through a similar process. This takes place without the application of external stimulant beyond that afforded by light or heat; the rapidity of the movement varies greatly, however, and in dull weather it is much reduced or ceases altogether, as it does when the plant becomes unhealthy or old. Sometimes the motion is confined to a few leaves, but it seems to depend chiefly on the age of the plant, the weather, or the conditions under which it is grown. In cold or a dry house it is much lessened, and does not continue so long.

Exposing Wood Ashes to Rain (D. H.).—When wood ashes are exposed to rain the potash and other salts are washed out, and enter the ground beneath and around to such an extent as to prevent anything growing on the spot for some time, though a luxuriant growth of whatever plants may be on the margin is the consequence. ashes are placed in a tub and water poured on them, and left a few days, the main portion of the soluble constituents of the ashes are found in the water, and this strained off leaves a residuum of very little manurial value; may be tested by applying these leached ashes to one tree and the lye to another, and noting the results. Dry wood ashes from wood not larger than a "cord" contained 8½ per cent. of real potash, and 2 per cent. of phosphoric acid, or about $4\frac{1}{4}$ lbs. of potash, and 1 lb. phosphoric acid per bushel. These are worth 2s. at least, besides which there is 10 to 15 per cent. of alkaline matter, available for converting vegetable substances in the soil into ammonia. A peck of wood ashes contains enough potash and phosphoric acid to support most crops on a rod of ground, but they must be applied in a fresh state to the soil, or if stored for future application, be sure they are kept dry. Leached ashes either from the lye-tub or from open heaps long exposed are hardly worth distribution. When ashes are placed in the soil their manurial proporties are not easily washed out, but they rapidly pass from the ash heap into the soil where they are not wanted, and like the drainings of manure heaps, represent liquid gold wasted.

Mixing Blood and Wood Ashes (Staffordshire Cottager). Blood and wood ashes are rather difficult to mix, not because of the coagulation of the blood with the wood ashes, but through the blood being already in that state and not readily divisible. If you stir the blood while warm until it cools, so as to prevent its coagulation, then there is no difficulty about the mixing. The blood being caught in a pail should be stirred briskly, and a handful of wood ashes at a time mixed with it, continuing this until a thick paste is formed; then turn out on a hard floor sprinkled with wood ashes, and spreading more wood ashes on the heap, mix thoroughly with a shovel as in making mortar, and having formed a crumbly mortar-like mass, sprinkle wood ashes over the heap and leave to dry. When dried it will break up into a powdery substance unexcelled as a manure for every kind of flower, fruit, or vegetable crop. The wood ashes must be dry and preferably heated to a temperature of 90° to 100° for mixing with the warm blood. If the blood is allowed to coagulate, it is best to dry it thoroughly and then grind it in a mill, as is done in manure works, though it may be pounded on a hard floor and made fine enough for distribution, adding an equal proportion of dry wood ashes and pure dissolved bone, mixing, and using about 4 ozs. per square yard. Or when the blood has clotted and is rancid, pour muriatic acid upon it at the rate of 4 ozs. to 16 lbs. of blood, stir, and add 16 lbs. of dry wood ashes, mixing well. When dry break up, and use as a top-dressing. The better plan is to mix the wood ashes with the blood before it coagulates.

Rooting Chrysanthemums (Young Beginner).—You cannot do better than insert cuttings of your Chrysanthemums at once if they are in the condition described. All persons who grow for exhibition take cuttings during November and December; in fact, as early as they can obtain them. They will not be too early for you if inserted now. It is a good plan to insert them singly in thumb pots under hand-lights in a cool Peach house or vinery. By adopting this method the plants receive no check—the hotbed is unnecessary. From the hand-lights the plants may be removed to frames and protected only from frost. Gradually harden them, and then give abundance of air. Treated thus Gradually harden them, and then give abundance of air. the young plants are grown strong from the first. All that are intended for bushes should be pinched when they are well rooted, and the growths they make are generally very vigorous. When 3 inches in length pinch You may safely continue this practice, if necesthe plants again. sary, until the beginning of May, when the shoots should be allowed to extend and only branch afterwards in a natural manner, which they may do again at the end of June or early in July. The buds that show during August must be "taken." If you manage the plants well there is no difficulty in having nine good blooms on a plant that will be creditable to you for purposes of decoration. When blooms are needed for cutting for filling various sized vases, however, some naturally grown free-flowering kinds, especially Japanese, prove invaluable. Do not pinch in July, only take natural breaks then. Plants stopped in May and then allowed to grow often produce buds in August, about the right time. Your potting arrangements are satisfactory.

Camellias Dropping their Buds (Young Beginner). — The buds of Camellias will certainly fall if the plants are allowed to become dry at their roots. Exhaustion will also bring about the same result. A very dry atmosphere after the buds have formed, for even a few days, will cause the buds to fall, or the flowers, by the time they are half or fully expanded. The mischief is frequently done weeks before budfalling is observed. Another cause, and a very likely one in your case, is unripened wood, if the trees grow as luxuriantly as you describe. If these plants are fully exposed to the sun and given abundance of air from the time the foliage is fully developed, or the wood commences to ripen and form buds, if well watered at their roots, the buds should not drop. All Camellias are flowering long before their proper time this year, especially those that have been kept under glass. This is due to the long spell of bright sunshine we have had, and the higher tempera-

ture to which they have been subjected in consequence. We do not advise you to prune the tree, either before growth or after the growth has been made. Retard the growth as much as you can, and allow the plant to start growing in a natural manner. It is doubtful if they will be as early next year, unless the plant is induced to grow soon in the season. The roots are probably too deep, which alone would account for strong growth, and probably the falling of the buds. We certainly advise you to take away down to the roots the wet, sour, exhausted surface soil. In doing so you may find that the water passes away by the side of the walls, and the evil may be easily remedied The soil can be substituted by good loam, one-seventh of the old rubble you describe, a little charcoal, coarse sand, or sandstone; broken bricks would also be beneficial if the loam is of a fairly heavy nature. materials would be better than adding too much lime rubbish to the compost. If the loam is light the amount of lime rubbish given would Cover the roots with about 4 inches of soil; press the latter firm. Do not surface-dress with cow manure. If the drainage is good, liberal supplies of water are needed; you could scarcely give them too much while growing. Directly the growth is maturing the atmosphere should be gradually brought to a drier condition until the flower buds are visible, when the syringe may again be freely used. Examine the border from time to time by means of an iron rod. If wet it will come out sticky, if rather dry perfectly clean. We cannot exactly tell you how much water to give, because circumstances alter individual cases so widely.

Names of Fruits.-Notice.-We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (C.).—1, Bergamotte Esperen; 2, uncertain, perhaps Napoleon; 3, Easter Beurré; 4, Forelle; 5, Vicar of Winkfield; 6, Rymer. (E. R. W.).—8, Beurré de Jonghe; 9, Golden Noble; 10, Court-pendû Plat; 11, Hollandbury. (G. E. W.).—1, Minshull Crab; 2, Alfriston; 3, Winter, Greening: (G. S.).—1, Allen's Everlasting; 2, Local.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (A. D. F.).—Jasminum Sambac. (L. B.).—Kentia Belmoreana. (H. E.).—1, Davallia Mooreana; 2, D. Mariesi. (Amateur).—Justicia coccinea.

PROFITABLE LIVE STOCK.

THE proverbial "Roast Beef of Old England" has become somewhat mixed under stress of Scotch enterprise and foreign competition. It is true that certain breeds are still sufficiently good to command special quotations at the metropolitan cattle markets, but Scotch beef has taken the lead, and is likely to keep it. At the Birmingham Cattle Show the champion prize was won by the Aberdeen-Angus heifer "Bridesmaid," of Benton. At Islington on the Monday following this Show the ileading quotations were - for prime Scotch, 5s.; for Herefords, 4s. 11d.; for Norfolks, 4s. 10d.; for Runts, 4s. 9d.; and for Shorthorns, 4s. 8d. per stone of 8 lbs. These quotations are far more significant than the Birmingham award, for although the champion Scotch heifer was also champion at Norwich, is a marvellously developed animal, and weighs 16 cwt. 3 lbs. at the age of thirty-four months, yet there were several English beasts at both Shows running the champion very closely, Mr. Wortley's Hereford steer weighing 161 cwt. at thirty-one months old, being even more remarkable for early development.

Such grand beasts are an interesting and instructive sight, showing as they do the comparative value of the leading breeds, but it is at the market and auction mart that lessons for the ordinary farmer are to be had. It is there that the failure of English breed beef in popularity and quality is realised. Yet the fact remains that for really prime homebred beasts there is always a ready market, but such beasts are not forthcoming; inferior animals predominate everywhere. It would really appear as though English graziers only finish beasts well for market occasionally, and that generally there is no attempt to do so. Meanwhile Scotch beef holds the leading place at markets, and foreign beef comes to us in everincreasing bulk, much of it being sold as "Prime English" or "Best Scotch." Returns show that of the total annual consumption of beef and mutton in this country, about a third consists of frozen or irefrigerated carcasses from abroad, or of cattle slaughtered at the port of disembarkation. moral of this fact is that inferior home-bred cattle will continue to keep low in value, that graziers of them will continue to obtain a bare profit, if any, and that the only profitable cattle to rear are those sufficiently well bred and well cared for to be really ripe for the butcher well within the second year.

The Report of the Parliamentary Committee which sat last summer to inquire into the meat trade contains much interesting matter, and shows particularly how in some towns English meat is practically driven out of the market. The most remarkable case is that of Southport, with its population of 41,500, for whom fifty-four butchers cater, yet not more than three English-bred animals were killed during each week among the whole of them. If Scotch beasts had preference in the north country towns no harm would be done, but there, as well as in the south, very much imported beef is palmed off as homebred. In London, says the report, in a large west-end establishment, professing to sell nothing but English and Scotch meat, only six sides of Scotch were said to have been sold during a whole year, the rest being American. In other shops in the city and west-end three-fourths of the beef sold as English is said to be American. Of five pieces of meat purchased in Kensington, in the neighbourhood of Piccadilly and Sloane Street, two competent judges declared four to be American. In each instance the vendors declared that they kept nothing but the best Scotch.

It is much to be desired that the report should lead to a measure for the protection of the interests of home-reared beasts. It is evident that there are plenty of people willing to pay well for really prime Scotch or English beef, and if only the trade could be placed upon a sound basis, it would be for the mutual benefit of producer and consumer. The gains of the middleman will be limited, and the British farmer would soon find home markets harden; or, in other words, prime beasts would become much more valuable, and his interest in rearing compact beasts of moderate size would be so apparent, that breeding and selection assuredly must have more attention than has hitherto been accorded them. We have no desire to see our ports closed against foreign meat, but we do claim that in common honesty it should be sold as such, and not be foisted upon consumers for the superior home-bred article. Appeals for aid to the legislature on behalf of struggling farmers have been made often enough where aid was impossible. In this matter there should be no difficulty. When an inspector detects a farmer sending diseased meat to London the farmer is fined heavily. Let inspectors also be appointed to check the transactions of butchers, and let adequate fines be imposed with all possible publicity upon any of them who are detected in a system of fraud, which has evidently attained gigantic proportions in many a pretentious west end "establishment."

WORK ON THE HOME FARM.

Lambing time commences at many farms, at most where mixed farming prevails, towards the end of the year or early in January, and preparations must now be made to afford the flock all necessary shelter and food. Every home farm should have its lambing yard, with a commodious hovel on the north side, a wall or corrugated iron sheeting enclosure, having a projecting roof, beneath which cribs are made for each ewe and its lambs to be confined in so long as may be necessary immediately after the lambing. Failing this, a lambing fold is made with parallel rows of hurdles about a foot apart, the space between them being so closely packed with litter or straw that cold wind cannot penetrate it. Thatched hurdles will not answer for this enclosure, because the ewes may pull out and consume the straw, but they are used for cribs inside of and against the enclosure, and as a roof to the cribs. See that this fold is of ample size for the requirements of the flock, and that it has a wide opening on to pasture, and another opening into a smaller or hospital fold, where ewes requiring some extra care and supervision can be taken from the cribs. Make all openings through which the flock has to pass large enough to prevent crowding, or a struggle to get through.

A small clamp of Mangold and another of Swedes is made near the fold, also a stack of Pea straw, and another of litter. If the fold is at a distance from the homestead, it is also a good plan to have a small store shed for crushed corn and chaff near the shepherd's portable hut. In all this work let the most severe winter weather of the past be your guide, making the shelter so thorough, and the store of food on the spot so ample, that it must be the shepherd's fault if the flock suffers. have often found that it is unwise to depend upon the daily carting of food supplies to the fold. This may very well be done generally, but upon an emergency, such as roads being blocked with snow, it is well to have a few days' provision at hand.

See that ewes forward in lamb are kept perfectly quiet, allow no

hurried driving by dogs, keep them on firm dry pasture, have a few racks for Pea straw placed near sheltered parts and troughs for chaff and corn. Let the condition of the pasture be your guide as to the use of these, but when once they are brought into use it is as well to go on using them, as sheep are often shy of trough food at first.

ROOT AND SEED STANDS AT ISLINGTON.—The ninety-sixth annual Show of the Smithfield Club opened at the Agricultural Hall, Islington, on Monday last, but not having received any reporters' tickets we are unable to enter into details as regards the exhibits. We understand, however, that Messrs. Sutton & Sons of Reading had a fine display of roots and seeds. The main feature was a collection of agricultural roots. Mangels were to be seen in perfection, prominent being Yellow Globe, a variety that is generally cultivated in all parts of the kingdom year by year. This kind has again been awarded the first prize for the best crop of Mangel, open to all England and Wales, grown in 1893. Gold Tankard, which has the reputation of being the best Mangel for milch cows, and Crimson Tankard are prominently represented. Among the Swedes the most striking was Crimson King. Champion was good, and maintained its reputation as one of the hardiest and best Swedes for general cropping. Some exceedingly fine roots of Perfection Turnip, a new green-top hybrid, were shown. Disease-resisting Potatoes receive general cropping. by Messrs. Sutton no less attention than roots, and on their stand there were twelve varieties of their own introduction, all of superb quality, Supreme, Windsor Castle, Triumph, Perfection, and Satisfaction being seen to great advantage. Educational cabinets of valuable and worthless pasture Grasses, and agricultural seeds were on view. Messrs. Webb & Sons, Wordsley, also had a splendid stand of roots and cereals, including grand specimens of Imperial Swede, Mammoth Long Red, and Globe Mangel. A choice collection of Potatoes was exhibited, together with a fine display of Grasses and Grass seeds, many novelties, and other items too numerous to mention.

OUR LETTER BOX.

Wheat for Cows (A. B.).—Crushed Wheat mixed with pulped roots, or with roots and chaff, may be used for cows advantageously, or it may form part of any mixed dietary for them. Begin with half a gallon, mixed with other food at milking time, and let the condition and size of each cow be your guide as to increasing the quantity. Avoid using it alone, and if you have other corn such as Oats or Barley, a mixture is always preferable to either of them alone. Marketable value has come to have much influence upon this matter, and we agree with you that it is better to use corn for farm stock than to sell it at a ruinously low price.

Thin Pasture (B. E.).—Fresh stable manure is unsuitable for pasture, but if you have old manure apply at once at the rate of thirty cartloads to the acre. This will strengthen the growth somewhat next season, but it will not thicken the plant. The proper way to proceed with pasture thin in plant and weakly in growth, is to cart soil (road scrapings, old pond mud, or ditch scourings) upon it, any time during the winter, but preferably in February. Drop the soil in small heaps at the rate of full forty cartloads per acre. At the end of February sow broadcast as evenly as possible over the pasture 20 lbs. per acre of renovating grass mixture. Then spread the soil heaps, roll sufficiently to crush the soil, follow with a bush harrow to cover the seed and mix it with the soil. Then at once apply a top-dressing of 1 cwt. nitrate of sods, 1½ cwt. mineral superphosphate, ½ cwt. muriate of potash, and ½ cwt. steamed bone flour per acre.

26th.—Continuous rain till 3 A.M., and from 10 A.M. to noon; overcast and damp afternoon; bright night.
27th.—Fine, but slightly foggy early; generally cloudy in morning; bright sunshine in afternoon, but slightly foggy after sunset.
28th.—Fair and mild, but scarcely any sunshine.
29th.—Overcast morning; fair afternoon but no sunshine.
30th.—Fair morning; sunshine for a couple of hours at midday, dull later.
1st.—Almost continuous rain from 0 A.M. to 9 A.M., then drizzle and occasional flakes of snow till noon; bright sun from 1 P.M. to sunset, and clear cold night.
2nd —Almost cloudless morning; generally sunny in afternoon; clear cold night.
A cool but variable week; sharp frost on the 2nd.—G. J. SYMONS.

branch extension in fruit trees, it is not unusual for the fruit spurs to become injuriously crowded, and in consequence imperfectly developed. When such is the case fruit trees may be a perfect picture whilst in blossom in the spring, but the fruit exceedingly scanty. This is frequently attributed to the inclement state of the weather during the blooming period. Frost and excessive wet will render perfect blossom abortive by injuring and destroying their essential organs of reproduction before they have performed their functions; but this is not always the cause of barrenness and the production of worthless fruit. It is often because the blossoms are imperfectly formed, in consequence of the spurs being too crowded. To allow a tree to open thousands of blossoms more than is necessary to secure a good crop is to exhaust its resources to no purpose just at a time when it is most needed.

It would be absurd, in our uncertain climate, to thin the spurs to a number only just sufficient to secure a good crop of fruit; indeed, we should not feel safe with less than treble the number that were necessary for that purpose. But then there are trees in otherwise good form—with ten times too many spurs, and it is to these we would direct attention. The best results generally follow if they are thinned a fortnight before the leaves fall, as then the remaining spurs would be strengthened and more fully developed by the returning sap. We are, of course, past that period now, but the mode may be advantageously described. In performing the operation some experience is necessary, for if done to too great an excess, the remaining blossom buds may develop into wood growth in the following spring, and the balance of the tree be upset for a year or two. The trees' growing power must be taken into consideration, and if this is known to be unduly vigorous, careful root-pruning must be resorted to.

We must not shorten the main branches, but let them remain full length, or nearly so; they will then act as safety valves to the superfluous sap just in proportion as they approach the vertical line. Horizontal branches do not act to any extent in this way, hence undue vigour must be dealt with at the roots. The finest fruits are usually obtained from spurs that lie close to the main branches in consequence of there being fewer interruptions in the flow of sap to the fruit; therefore, in thinning the spurs, preference should be given to them. Indeed, one of the main objects in thinning and shortening the spurs is "to keep them at home." It will, however, sometimes happen, especially if the spurs have been much crowded, that the inside lowest fruit buds are not sufficiently developed to produce perfect blossom the following spring; in which case a few of the outside plumper buds must be left, and then be promptly removed as soon as the fruit is ripe the next year.

In well managed trees spurs never attain to any great length, as by summer pinching and autumn pruning short spurs are obtained; but in neglected trees they are often crowded, weak, and long. Trees in this condition cannot be made presentable and capable of bearing full sized, good flavoured fruit in less than three years, and sometimes more. The flow of sap to the fruit is so much impeded in its passage through these long gnarled growths that the fruit is usually small, insipid, and worthless, and the tree altogether a mere cumberer of the ground. Providing the main

stem and branches are healthy much may be done with patience and a judicious selection of buds in rectifying former evils, also in bringing the tree into a profitable state in much less time than a fruitful young tree could be produced. Those buds most distant from the main branch should be cut off the first year, which will have the effect of strengthening those immediately behind them, and in many cases induce the development of fruit buds lower down on the spur, and sometimes on the main branch at the junction of the old spur.

If we are induced by our impetuosity to cut back the old spurs too much the first year, these latent buds that have been excited sufficiently to form close fruit buds, would develop vigorous wood growths, and thus in the end we should have lost time. The second season we may get some fairly good fruit, but we must still avoid cutting the old spurs too hard. Unless the root-action is very feeble we can seldom venture to cut back to the new fruit buds on or near the main branches until the third season.

As before stated, undue vigour must be dealt with at the roots, but we must at the same time have sufficient vigour to excite the latent buds at the base of the old spurs. In practice we find it best to defer root-pruning until the second season, in which case the old spurs can be considerably reduced.—J. H. W., Leicester, Frith.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

AN APPEAL TO GARDENERS IN IRELAND.

ERE the dying year passes and the new one comes, bringing with it its new hopes and fresh resolutions, I venture to bring forward a subject which has received much attention in England from gardeners and the patrons of our art, yet seems to have been given but scant consideration from gardeners in Ireland. Though I hope these few remarks may be looked upon as an appeal to all persons who are not subscribers to this noble Institution, they are especially submitted to the consideration of my brother gardeners in the Green Isle.

The plethora of candidates for gardeners' situations which obtains in our time is known to all. The years of self-denial, burning the midnight oil, the difference of being in or of being out of a situation, and the bitterness of waiting are known to many as well as to me; perhaps a few remarks coming from the pen of a gardener to gardeners may claim that sympathy and attention which abler pens in higher quarters have failed to attain, and which the subject deserves.

While other trades and professions are forming and supporting benefit societies over the length and breadth of the land, we appear to be the only class in this age of progress content to let things run on as best they may. All must and do recognise the importance of our art, which began with the first man, and which probably will only end with the last one. We cannot compel the moneyed classes to create more gardens for gardeners, nor prohibit young men from coming into the overcrowded field. For this evil I see no remedy; but, fellow workers, I do see one clearly defined duty, one way in which we can help ourselves-viz., by becoming members of the Gardeners' Royal Benevolent Institution. Some gardeners may, indeed some have, met me with the remark, "Oh, I may never need the bounty." True, O friend! I trust you never will. Your remark is not heartless, only thoughtless. We are not a selfish class, but do not refuse to "help a worn and weary brother pulling hard against life's stream."

Do start this new year by sending a guinea to the Secretary. I hear your remark, "A guinea is a guinea." Yes, it is, and something more to a gardener. Our guineas are heavy with days of toil and nights of thought. I know it, and there are so many ways for them, as a rule so many olive branches in the gardener's cottage, though there may be none in the castle; you are perchance

No. 2359.—Vol. LXXXIX., OLD SERIES.

in the mid-day of life, and the evening yet seems so far off, and the future pregnant with so many possibilities. We have so much to bother us, so much to cope with, ever-increasing worries, these scientists with their microscopes ever and anon finding out some new bug where no bug should be, and so we go on digging, planting, sowing, reaping, so busy.

> "Well doing is our wealth, Our mind to us an Empire is While Grace affordeth health."

but "unerring nature" at last silently but forcibly tells us we have had our day, the evening of life is at hand. Dame Fortune, the fickle jade, has not perhaps realised the possibilities of long ago, and perchance after all those precious guineas, sown annually, may not only have helped "the worn and weary brother," but

return to us increased an hundredfold.

I need not go into details of the Institution; all that will, I am sure, be willingly given by Mr. Ingram, the Secretary, 50, Parliament Street, London, to those who do not already know. Do you not think that amongst the 156 aged gardeners or their widows now on the pension list, that there is not amongst that number some who have thought and made the remark about not needing it that I have supposed you to make, and have lived to find "the bread then cast upon the waters" returned to them again? Are there, beyond the small amount of self-sacrifice, any good or valid reasons why you should not subscribe to it? I hope to have made

clear some reasons why you should.

In the "Horticultural Directory" there are some 300 names of gardeners in Ireland, and in the last report of the Institution there are fifteen—please note, but fifteen !—gardeners subscribing to it from Ireland. Now I take it that he whose name appears in the "Directory" is of more or less prominence in the gardening world, and that there is no name there but what is worthy of being there, so I respectfully and earnestly say that all those names should be found, and are worthy of a place in the report of that noble institution founded in 1838 for the benefit of aged gardeners or their widows; and should it never be needed by yourself you will at least have the unalloyed pleasure of helping some old friend to whom Fortune has been less kind by giving him the votes at your disposal on becoming a member.—E. K., Dublin.

CITY GARDENS: PAST AND PRESENT.

ONE of our modern authors, who has drawn fancy pictures of the future, has suggested that the City of London may some day undergo a pleasing transformation, and that groves or gardens may appear in the place of huge warehouses and busy offices. to happen by much of its business being relegated to the suburbs, while some of it is carried on underground, so that the surface of the City may be dotted over with only a few buildings, and present a broad space available as a place of meeting or promenade, to be intersected perhaps by an electric railway. As yet there are no signs of this change coming about, but much has been done of late for the improvement of those small spaces in the City which bricks and mortar have not covered, and most of which, not many years ago, were scenes of desolation, neglect, or even filth. They were closed mostly to the public - which was quite as well-now some of them are opened free, and turned into gardens; others, still kept private, have also been improved by the introduction of shrubs and plants. Even yet much may be done to make the best of these generally small gaps amidst the busy streets; several, at present inaccessible to visitors, might be thrown open, and many more shrubs and trees planted. It is found that the number of trees which will live, flourish we can hardly say, in the City atmosphere is larger than was formerly supposed. Of course a atmosphere is larger than was formerly supposed. serious disadvantage we have to contend with is the destructive propensities of the host of boys employed about London's centre who frequently commit damage from pure mischief if trees and shrubs are accessible, but I am glad to find that caretakers of city gardens report an improvement recently. Also, we are told London trees suffer from the conduct of climbing and pugnacious cats, a nuisance not limited to the metropolis.

We have no pictures extant showing the City as it was during the Middle Ages, nor even in the times of the Stuarts, but, by description, much of it had for a long time a semi-rural appearance. There were rows of trees, some for shade or ornament, others of fruit-bearing kinds; flower-plots and gardens of herbs attached to many of its mansions, also patches of ground upon which vegetables were grown. A large number of the London citizens and merchants had a taste for gardening, and as they could not obtain the needful space within the walls, as early as the fifteenth century some of the citizens hired or bought land in the east and north of London, where they cultivated plants for use or amusement, many of these

being situate along the City Road. In the reign of Elizabeth they were beginning to go still further north, and form gardens about Hogsden, or Hoxton, and Cantelowes, the old name for what we now call Kentish Town. Both the City of London and its vicinity were favourably situated for horticulture, owing to the numerous little hills and sheltered valleys below them, while the soil was refreshed by the course of winding streamlets, long dried up, which

ran from the Middlesex uplands into the Thames

The warmth of the City favoured the growth of some plants, no doubt, and until the seventeenth century, or about that period, no coal was burnt in the metropolis, so the atmosphere was free from those carbonaceous particles which clog the pores of leaves and stop the development of buds. Evelyn, writing in the seventeenth century, refers to the fine orchards there were near the Barbican, a well-known tower on the old Roman wall (presumably these orchards were just beyond, not within the City), and he notes the fact that when the supply of coal from Newcastle was suspended, owing to the Civil War, a much larger yield of fruit was obtained than had been known for some years. He proceeds to comment upon the objection to sea coal, not only as being hurtful to vegetation, but as a cause of colds, coughs, and other diseases. Actually in the City, however, there were many fruit trees, some of which bore fruit till they were cut down to make room for new streets. St. Martin Pomary, in Ironmonger Lane, a church destroyed by the Great Fire, was said to have received its name from the Apples that grew around its site. Vines on the walls of some of the houses of the nobles yielded good crops of fruit, and it was observed that the Fig seemed to thrive in the London air, and Mulberry trees were planted here and there in City gardens; two of these, of great size, near Ludgate Hill, bore fruit till the reign of George II. Almost in the shadow of St. Paul's Cathedral, even when the Stuarts began to reign, Ivy Lane was green, from the specimens of that plant which covered the houses; and the Drapers' Company had a large garden in Throgmorton Street. Others of the City companies had gardens attached to their halls, and in several of these they grew Roses, Gillyflowers, and the few flowers besides which adorned old English gardens.

A little way outside the City proper, gardens there were that yielded an abundance of Roses during the seventeenth century. In Eald or Old Street, St. Luke's, was a rosery of two or three acres, and near it a nursery planted with the best kinds of fruit trees then known, from which plenty of fruit was obtained. In Ely Place, Holborn, there was a vineyard, and the garden was famous for its Strawberries, while the Roses were so abundant there that the flowers were measured by the bushel when gathered to be paid as a yearly perquisite to Bishop Cox, after he had surrendered to Queen Elizabeth this property long held by the Bishops of Ely. One of the first gardens in which a large collection of exotics was grown, and which testified to the skill and research of Master Gerard, was situate on the slope of Holborn, and the now unattractive Saffron Hill, Clerkenwell, was formerly yellow with the bloom of this much-esteemed plant. Out in the East of London, quite in sight of its ancient Tower, were gardens in which Kale and other vegetables were raised for consumption in the City. Goodman's Fields was no fiction when Stow wrote about London; there was a farm near the Minories, and cattle grazed along the fields. Subsequently this was cut up for garden plots. Prescot Street, close by, is said to have been originally Peascod Street, from the Peas planted on the ground. West of the city, the now curtailed Temple Gardens offered citizens a pleasant evening resort, and the palaces of the Strand had long gardens reaching to the Thames.—J. R. S. CLIFFORD.

WINTER IN A SCOTTISH MANSE GARDEN.

OF all the seasons winter is generally supposed to be the least inspiring by reason of its prevailing barrenness of aspect, yet it is not altogether destitute of inspiration. It has, indeed, infinitely more life and energy than outwardly appears; for are not the seeds of summer's luxuriance steadfastly growing, invisibly to the vision, beneath the inglorious blackness of the winter earth? Does not Nature tell us what Revelation declares—that what we sow in the seemingly lifeless ground is not quickened or vivified by the subtle, mysterious, reanimating elements unless it die?

We have now so many floral gradations, flowing onwards unceasingly and dying into each other, as wave into wave on a boundless sea, that even during the so-called desolation of winter the earnest horticulturist can never realise that the beauty which waited upon his art in fairer seasons has utterly departed, leaving him to mourn the glory that has fled. His hopes, which seemed to fade in November with the last autumnal Rose, are rekindled when the winter Jasmine (Jasminum nudiflorum), as if to assert proudly that Nature is not dead, bursts suddenly into bloom.

Nothing is at present more gladdening to my vision than the picture presented by this marvellous flower, surviving the fiercest influence of the recent frosts, and fearlessly confronting with all its

gentle beauty the cruel northern blasts.

Hardly less consoling to the worshipper of Nature amid the storms of winter are the Aconite and the Snowdrop, the latter of which, as if resolved to become the predecessor of the former this season, is already above the ground. It will, I anticipate, be in flower in my garden at least a month earlier than it was last year. Another gem which promises to bloom prematurely is Sutton's Anemone, somewhat resembling A. fulgens (better known as the Scarlet Windflower) in appearance, but of larger dimensions and more lustrous hue. It is, I can certify, a very distinct development, and a precious acquisition. The Glory of the Snow (Chionodoxa Luciliæ) has not yet announced its ever-welcome advent, probably because I planted it so late. But, on the other hand, I have already flowers not too large or lustrous on Helleborus niger, the Christmas Rose. I am not without hope that as the season advances these will improve.

Roses have lasted for a long time this year. I cut my last bouquet, and a splendid one it was, on the 14th of November, from Baroness Rothschild, Pride of Waltham (also the pride of Kirkmaiden Manse), Ella Gordon, Jeannie Dickson, an Irish beauty, derived from the venerable Baroness and Marie Finger, and combining the characteristics of both; Perle des Jardins, well worthy of such a name; Prince Arthur, a darker and more velvety Général Jacqueminot, and a native of Colchester; and the snowwhite pendulous Souvenir de S. A. Prince. If this certificate in favour of those exquisite varieties of the Rose is not absolutely eloquent or impressive in expression, it is at least sincere.—DAVID R. WILLIAMSON.

SAXIFRAGA BITERNATA.

THIS fine species is seldom met with, though it cannot be considered a new plant. It belongs to the section Nephrophylium, of which the best known representative is the common S. granulata. All the species composing this section are deciduous, and of a more or less bulbiferous habit. S. biternata has, as will be seen from the accompanying engraving (fig. 76) very distinct biternate leaves, which form fine tufts of bright green colour. The flowers are pure white, comparatively large, and are borne on short stalks. Like the other members of the section, S. biternata prefers a damp shady position in sandy peaty soil. It is a native of Spain and Algeria. The illustration has been prepared from a plant that flowered in the Royal Gardens, Kew, last spring.—A. B.

THE FRUIT KEEPING QUESTION.

I CANNOT at all bring my mind to the same conclusion on this matter as Mr. Iggulden (page 437), Mr. Cheal, and Mr. Pearson (page 488) have brought theirs. Nothing is easier than to set up a theory and to sustain it, even though it may be radically incorrect, when we are faced by a problem that it is difficult to solve. One speciality of all the large fruits soft and thin of texture that have been found so abundantly this season, and then have so suddenly collapsed, is that so far from being filled to overflowing with sap, they have all been exceptionally lacking in sap or juice. What proof is there furnished that there has been any such rush of sap as is here referred to? Has any grower found this autumn that trees have made unusual wood growth because of this "overflow of sap?" or, to accommodate this pleasing theory, did it all concentrate its rush into the fruits and not into the wood? All plant physiology tells us that the leafage is the great sap-attracting force, and that did this rush after the autumn rains but have taken place then we must have seen it evidenced in an unusual autumn wood growth. That, however, was not so. There was nothing at all abnormal in the wood growth of fruit trees anywhere this autumn, but there is ample evidence that this sudden collapse of fruit began before the autumn rains occurred.

"N. H. P." (page 508), also oddly enough jumps to the sap theory conclusions with a real rush. "Pears, the early ones, have been the greatest trial; gathered one day they seemed to be decayed the next," this, too, long before we had any considerable rainfall. If the early Pears before rain came thus went, is there anything remarkable that the later ones followed suit as speedily? Then what does he say about late Apples? "These are keeping well," and yet if the rush of sap theory is to have effect, these should, having to endure so much more of it, have suffered equally with the

others.

There were some localities where prior to Apples and Pears being gathered there was not enough of rainfall to influence the roots.

In these districts the fruits have gone as early and as badly, if not worse, than where there was early and heavy rainfall. Depend upon it we have not in our fruit suffered from the autumn rains. Their influence on the fruits were inappreciable. The impression seems to be that roots are like a sponge, which sucks up every drop of water speedily. No evidence has been afforded that roots did anything of the sort in the autumn, and indeed there is no proof that the autumn rains, those prior to the end of September, were anywhere in sufficient force to reach the roots of trees, or to materially influence them. The bulk of the heavier rains came in October, and then the greater portion of our finest Apples and Pears had been gathered. No doubt the abnormal heat and drought of the season has wrought all the trouble. Through lack of root

FIG. 76.—SAXIFRAGA BITERNATA.

moisture the fruits were imperfectly formed, they lacked juice and substance. They more resembled forced Apples and Pears in texture and in method of production. We may grope as in darkness after shadows, as a drowning man catch at straws, but we shall never be able to escape from the conclusion that not the refreshing autumn rains, but the abnormal heat and drought which preceded is the cause of all our hardy fruit troubles.—A. D., Surrey.

In reference to the remarks of Mr. Iggulden (page 437) I have looked over the fruit room, and find our large collection (some 200 varieties) on the whole keeping well. It must be borne in mind that this year we are at least four weeks earlier than usual in the ripening of nearly all fruits; and, as a natural result, the August and September kinds of Apples are nearly all past, though in an ordinary year we keep them till January. Potts' Seedling, Ringer, Cellini, Professor, and Manks Codlin, are still good and sound, also the Old Hawthornden; but the extra size fruit of the large-growing sorts, having reached an abnormal size this year, could not be expected to keep well. All the largest specimens are nearly past. Warner's King, The Queen, Queen Caroline, and Codlins are the only kinds which, as a whole, are not keeping well. On the other hand, the Apples that require a warm time are very grand in colour and size, and Calville Rouge, Calville Blanche, Calville Malingre, Sturmer Pippin, Clark's Late Pippin, Royal Russet, the Nonpareils, the race of Pearmains, and Reinettes, are very sound, and look like keeping well. I would caution the public not to be led away by the past hot season. Not only was it exceptionally warm, but the spring was so genial that the fruit never had a check. Though it did not make much progress in the drought, it very rapidly swelled when the rains came in May and June, and in this way had a month's start. These circumstances may not occur again for many years.

We have had the American varieties in our nursery for twenty years, but with the exception of Wealthy, Melon, and Mother Apples they have never been of any value outside. Northern Spy never fruited at all. No doubt the "Americans" we have will keep, but that is of no use if the quality is second-rate, and from present appearances our British sorts will be as good late as the Americans. We have in very fine condition Wagener, Melon, Peck's Pleasant, Fallawater, Wealthy, Mother; but King of Tomkins County, Twenty Ounce, and Washington are a little past; and Baldwin is very inferior; Newtown Pippin, small, but of plump texture, and just changing colour; New Rock Pippin,

good.

Since writing the above I have seen Mr. Cheal's sensible remarks (page 488), and concur with him, that we cannot do better than plant our own tried kinds. Our fruit room is on the soil, and we keep this damp, thus preventing that shrivelling which is often so prevalent where too dry an atmosphere is kept. After the fruit room we will turn to the trees, and now that the leaf is off a little we can see the bristling fruit buds and the dark brown wood ripened to the tips, which gives us hope for next year. We have heard no complaints among the large growers as to bad cases of decaying in stores, and generally growers are well satisfied with the prices which have ruled for really clean well sorted fruit. Wagener Apples, as grown here, are finer than the Canadian examples shown at the Drill Hall, but at present they have a distinct Quincey flavour.—George Bunyard, Maidstone.

The general complaint, as Mr. Iggulden says, is that Apples keep badly this year. No doubt this is to a great extent caused by the large amount of saccharine in the fruit. This is easily observable in the large number of cider fruit, which I convert into cider. The juice of nearly all varieties, when tested with the saccharometer shows 10 per cent. and more than their usual quantity of saccharine. At the same time, when estimating the time of ripening Apples and Pears, it must be remembered that the season 1893 has been quite a month earlier all through, both in time of blossoming, setting fruit, ripening fruit on trees, and, therefore, maturing later sorts in store. However, in cool fruit rooms and when the fruit was left to mature well on the trees I have no fear but what the late sorts will keep well. No doubt in certain cases the fruit did get sunburnt, some of the softer fleshed varieties especially. I quite agree with Mr. Iggulden that we can limit our varieties too much. It is always observable that seasons will suit a variety which will not when others usually prolific fail, and the same also applies to localities. At the same time it is folly for market purposes growing too many sorts.

As regards American sorts, I believe they are usually better keepers than ours; this season has suited them, and they are much finer than usual; but it does not follow that it would be wise to cultivate them generally. Such sorts as Newton Pippin, Baldwin, Northern Spy, and others will never pay to cultivate in this country. Amongst the best are American Mother (grand for a warm soil), Wealthy, King of Tompkins County, Rhode Island Greening. These, I think, are worthy of extended cultivation. Jonathan is a good keeper but poor bearer. I have added about fifty of the newer American varieties to my trial plantation, procured direct from America and selected as those sorts most highly spoken of by the leading fruit growers there. Whether they will prove as good in our climate is a question which can only be answered by years of trial, but as a rule I find an Apple does not retain the reputation it does in the country of its origin.—John Watkins, Pomona Farm Nurseries, Withington, Hereford.

I HAVE read with interest the articles in the Journal of Horticulture on the keeping of Apples this season. I quite agree with "A. D." (page 465), that in a season like the past, our ordinary methods of keeping Apples are not the best. The advice as to the stacking of Apples outdoors is worthy of being put into

practice. I generally select a dry plot of ground where I intend to stack the Apples, and spread clean Wheat straw from 1 to 2 inches thick on the surface. The Apples are placed on the straw and formed ridge shape, like Potatoes, all bruised and small sized fruits being placed on one side for immediate use. After forming the ridge I cover the Apples with clean straw, and bank up with soil, fixing a 2-inch drain pipe at intervals on each side to let out moisture and admit a current of fresh air. During frosty weather the mouth of the drain pipes can be easily closed by being filled with dry bracken. I have 50 bushels of Apples stacked in this manner, and I am confident from the results of past experience that the fruit will well repay me for any extra labour, and will keep far better this year than others will in an ordinary fruit room. The Apples I usually store thus are for use after Christmas.

Much fruit is yearly lost by careless gathering. Only men who can thoroughly be depended upon should be allowed to perform the work. The practice of shaking down fruit because it cannot be reached without a little exertion on the part of the fruit gatherer should be deprecated. On the whole my Apples, both in the fruit room and those which are stacked, are keeping well. Those produced from trees in the orchards are very firm, especially so from trees planted on the hillsides facing north and east. The late Mr. T. A. Knight had his orchards established on ground facing all aspects, and the wisdom of his so doing is fully apparent in that we generally secure, no matter what the season, an abundant crop of Apples for home consumption. Our orchards are not planted with a few sorts, but with trees of many well tried varieties known to suit the soil and climate, so that if one variety fails,

others yield a crop of fruit.

I quite agree with Messrs. Iggulden and Cheal that there is some danger of too few varieties being planted. My advice is plant many trees of early and late varieties which are known to suit the soil in different parts. Beauty of Kent with me is sound at present, also Blenheims, King of the Pippins, Jefferson's (Devon Red), Hollandbury, Mère de Ménage, Reinette du Canada, Golden Noble, Goff, and Wyken and Ribston Pippin. I have said nothing about Dumelow's Seedling, Northern Greening, and other late varieties. Those who are fortunate enough to have a good supply of late Apples will be able to realise good prices for their fruit. It has been a sad sight this season to see so much fruit wasted because fancy prices could not be obtained. — John Chinnery.

CIRRHOPETALUM ORNATISSIMUM.

This is a beautiful little Indian Orchid, second only in size and interest to the new C. Colletti, to which it is closely allied. The former was introduced from Sikkim in 1882, when it was named by Reichenbach. It first flowered, says Mr. W. Watson in the American "Garden and Forest," at Kew in 1887, and a picture of it was published in the "Botanical Magazine," t. 7229. A plant of it was exhibited in flower by Sir Trevor Lawrence, Bart., at a recent meeting of the Royal Horticultural Society, who awarded it a first-class certificate.

It has four-angled pseudo bulbs springing from long creeping rhizomes, a leathery leaf 4 to 6 inches long, and a graceful scape 8 to 12 inches long bearing an umbel of flowers, each 4 inches long, including the tails of the broad curiously twisted sepals, which are yellow, lined with dots of purple; the short petals are each tipped with a brush of red paleæ; the labellum is small, tongue-like and coloured purple-black. Cirrhopetalums are finding general favour with English cultivators, being easy to grow in a stove, free flowering, and exceptionally interesting in flower structure.

ODONTOGLOSSUM CRISPUM.

A CORRESPONDENT writes to a foreign contemporary that the best varieties of Odontoglossum crispum have been found, so far, in a comparatively small range between the fourth and fifth degrees of northern latitude on the western slope of the eastern Cordilleras, and at an elevation of 6000 to 7000 feet. The plants grow higher up the mountains, and farther north and south; but when found at an elevation of 9000 feet they are smaller, with more decidedly pear-shaped bulbs, which shrivel a great deal when they are dried off. At the elevation of 9000 feet the temperature sometimes falls to 42° Fahrenheit, while at 6000 the thermometer never registers less than 55°.

O. crispum is fond of light and air, and, therefore, does not grow in the dense woods, but on the edges of openings, where it can receive sunlight and enjoy the breezes. This is why it seems to follow the little streams and gullies in the mountains which apparently split the forests open. It grows on the thick limbs and crotches of large trees, such as the Chinonas and Melastomas, and the trees upon which these Orchids are found are cut down without mercy, and the plants are torn off and shipped away.

CATTLEYA CITRINA.

Relative to the remarks upon Cattleya citrina, by "C." (page 505), I would like to state what has been my experience with that fastidious Orchid. I once had charge of some plants of it fresh from the nursery, evidently only newly placed in small pans. The pseudo-bulbs were perfectly upright, but as the plants commenced to grow, the growth described a half-circle, and when about $1\frac{1}{2}$ inch long were something like a half-moon. The following year they resumed their old habit of growing downward.—F. Tugwood.

In reply to your correspondent "C.'s" inquiry (page 505), with regard to the downward position of Cattleya citrina, my experience is that it grows much stronger when placed in shallow pans, and consequently produces finer flowers and more freely. Although placed in paus in the upright position, the next growth made will assume its natural position downwards. When so cultivated, the growing point should be placed close to the edge of the pan, the growth is then unimpeded, and its pretty sweet-scented flowers are seen to the best advantage.—W. H. Stephens.

Your correspondent "C." (page 505) asks about growing Cattleya citrina. It grows naturally downwards; if it be placed in a basket with the pseudo-bulbs upright, it soon grows over the side. I have more than a hundred, all in perfect health and vigour, some of which I have had more than twenty years. They are growing on a great variety of materials, all nearly equally healthy, whether on cork, several kinds of bark, Oak root, Teak baskets, stages made of split pieces of Oak or Laburnum, Acacia, bundles of Yew branches tied together, or others also. I think perhaps I like the Yew branches better than anything. Of course, I generally tie them on with the pseudo-bulbs pointing downwards. I never tried them in a pot with peat and sphagnum; but I should think there hardly could be a worse way of growing them. Like most Mexican Orchids, they thrive in an airy greenhouse or vinery, but not in an Orchid house.—C. W. STRICKLAND.

JUDGES JUDGED.

As you say your pages are open to any explanation regarding this matter (page 503), I shall like to give my opinion. I do not say the Judges were correct or not in their awards, but as to the charge you make against the Committee not appointing competent Judges is not correct. I know for a fact that the Judge appointed for this particular class is one of the best in the south. But what of that? He telegraphed to the Secretary the night before the Exhibition, stating his inability to act. I think you and your correspondent ought to have known the whole truth about this matter before giving your verdict of guilty against the Committee.—BERKS.

[We certainly did not pronounce the Judges guilty of incompetence. We carefully refrained from doing anything of the kind. The Committee are wholly and solely responsible for that verdict. The only way of ascertaining the "whole truth" was by inviting information, and we are obliged by the quota supplied by "Berks." Perhaps he could supply more.]

The article respecting this in last week's Journal is very instructive, and shows very plainly that committees cannot be too careful in selecting judges, that, of course, is taking it for granted that one "expert" is more than equal to the three judges in question. A similar case came under my notice during November. The exhibition was not a small one, as may be seen when I mention over £30 were awarded in one class for cut blooms. Two sets of judges were appointed, one pair to adjudicate on the cut blooms, the other the miscellaneous plants, as well as the groups of Chrysanthemums. Of these latter there were nine, and these were classed "for effect" and "quality of blooms." The judges who awarded the prizes to the groups, considering their work finished, left the exhibition. It was then discovered that the certificate of the N.C.S. should have been awarded to the best group in the show. The judges (one of whom was an expert) who officiated on the cut blooms were asked to make the award, and they proceeded to do so. The certificate fell to a second prize group, much to the discomfiture of the secretaries and committee. This plainly showed some persons had erred in judgment. To get out of the difficulty, the certificate was ultimately awarded to a non-competitive group of well grown plants. The mistake apparently was in having really good "all round" and

practical gardeners who were not Chrysanthemum experts as judges for the groups. I would like to add the committee were apprentice hands, this being the society's second year of existence.—VISITOR.

Unless committees of flower shows are always prepared to submit disputed awards of judges to some court of appeal it is most obvious that the old formula, "the judges' decisions are final," must be adhered to both in spirit and in letter. A graver violation of their own law could hardly have been conducted than was that act referred to in your leader of last week. That a committee should first deliberately select certain persons to act as judges at their show, men whom it would have been a complete condemnation of the competence of the committee, if incompetent themselves, and then to practically admit that they were incompetent by employing "an expert" to repoint the flowers in the disputed class, was one of the most inconceivable insults ever inflicted on judges, that is to say if it were done as alleged by your correspondent. I do not know who the judges were.

But who was the "expert," and what special qualifications did he possess that were not possessed by the Judges? Is it a case where a Committee obtains the assistance of local men on the cheap, and finds that such help is dear in the long run? or is it a case of securing the best man obtainable at reasonable charges? This should be made known, although neither between the former would justify the Committee for one moment in withdrawing confidence from their Judges after the awards had been made, and in inflicting upon them the grossest of insults.

It is, it must be held, imperative in every case—except where Committees thoughtlessly admit of appeals to some other authority than the regular Judges—that the decision of these officials must be final, and without appeal, except, of course, in some proved case of fraud, which is of a very different nature. To open the door to indiscriminate appealing would be to evoke all the wildest and fiercest passions of human nature, and to convert flower shows into pandemoniums.

human nature, and to convert flower shows into pandemoniums.

But, after all, the "expert's" pointing proves nothing. It simply shows, if anything, that it is utterly impossible to establish any code of pointing that shall in all cases be infallible, for the simple reason that the code has to be in all these cases determined by diverse people. I will wager that if a dozen "experts" had followed the Judges in this particular instance that no two would have pointed alike. If anyone doubts let them test a case next season, and note the result. It is so easy to see, did we admit the process of "judging the judges," that we should be landed in chaos, whilst in theory I see no reason whatever why the points awarded to each flower might not be made known to the exhibitors, and specially the full number of points awarded to each exhibit. If ully understand that in practice it might lead to an intolerable nuisance. It is a degradation of exhibiting that some dissatisfied exhibitors should hang about their exhibits and wrangle and complain, and exhibit so much of the worst aspects of human nature. This sort of thing it is feared the publication of individual pointing would largely increase. So much yet has to be learned from Dean Hole's Rose book's adjuration—

"But if ye fail, or if ye rise,
Be each, pray God, a gentleman."

—D

Your leading article (page 503) deals so fully with the matter of exhibitors' protests, that little clse is left to be said. Year after year I am the more convinced that judging by points where the stands of blooms are close in merit is the only just method of awarding the

At an important show where I was engaged during the last month valuable prizes were offered for twenty-four Japanese blooms. At least five of the competing stands were close in point of merit. After the public were admitted a well known Chrysanthemum judge remarked to me after well examining the exhibits in this particular class, "I am sure the blooms here are close to-day, would you mind telling me what difference separated the first and second stands?" "Certainly," I answered, and turning to my notes replied, "3½ points." The question and answer occupied less than one minute. How could the difference be noted so quickly by any other method? Some judges favour what I term the comparison method. Instances have occurred this year where exponents of this method have officiated, and upon being appealed to civilly to state the difference between certain stands, replied curtly, "That's my business."

It cannot be said that the blooms placed first by the "expert" (page 503) were of high excellence, or else this individual pointed them low. Forty-eight Japanese blooms of good quality should give at least 195 points, and when extra good in all respects twenty points more would not be out of the way high pointing. My opinion of awards made is that the adjudicators should be in a position to give a reason for their decision, and when this can be clearly done seldom are the judges at fault. It is those persons who cau give no tangible reason why one stand of blooms is superior to those in another that make errors.—E. MOLYNEUX.

Possibly those who are always "judges" will be those who trouble themselves the least about your leader. Yet, as a rule, judges are, I believe, strictly honourable men; but though honourable men, they are men, and therefore fallible. Those who, like myself, occasionally act in that difficult and by no means to be desired capacity will perhaps think more about the incident therein mentioned.

On the part of the judges there is very much to be said. There are rules about "the tents being cleared for the judges" at a certain hour, which should be just as binding as "the decision of the judges is final. One is as much a regulation of the show as the other. Yet, where do you see it carried out? and who is the Hercules that is to sweep this Augean stable clean? Why are the judges to have the time at their disposal (generally utterly inadequate) cut short by the breaking through of one

rule, whilst another regulation may not be interfered with?

In judging Roses there is no doubt that the verdict given by the judges at noon may often be considered unsound by many at 4 P.M. The judges, however, have to judge flowers as they are, not as they may be a few hours hence; but in the case of Chrysanthemums there is a lasting power the Rose possesses not, and in the afternoon judgment may be as easily settled as at the earlier time. Many years ago, I think nearly half a century, when reporting for your pages a large West of England Show, I noticed what I considered errors in judging. One of the exhibitors, whom I knew only by name, somehow fixed the report on me, and was exceptionally indignant, not that I cared an atom for the gentleman's spleen. Well, in that report I suggested that judge should judge the judges. The idea was scouted, but here at this Exhibition something of the kind seems to have been done, if your correspondent is accurate in his statement.

My idea was this. We—judges, exhibitors, committee-to error, there is nothing infallible about us. Why should Why should we ape it? Assuming, then, that judges may make mistakes—and sometimes, recollect, it may be an accidental error of copying on the card the wrong number of the exhibitor-why should not another judge scan the verdict before its being sent to the secretary's tent, and detecting what he may consider an error, tap his brother judges on the shoulder and say, "Come, just point over these two stands with me?" It is well known that stands may be so close together that points do not separate them, and the judges are forced to take setting up into account to decide; these are not the cases where dissatisfaction arises. Possibly in the case mentioned there was little to choose between third and fourth prizes, but when you come to compare these with the second prize it is plain that a matter of thirty points must have been a startling difference in the stands. And it is for these manifest oversights or misjudgments that the extra judge making his own conclusions and finding them at variance with the recognised censors, might advantageously hold a consultation with them before the decision is made

Some such arrangement would do away with such a glaring case as the comparison between second, third and fourth prizes at the exhibition named; nay, it actually did detect the error, but too late for alteration.—Y. B. A. Z.

THE case mentioned on page 503 is the worst muddle I have ever heard of. Neither judges, committee, or secretary are to be congratulated, and it appears doubtful if the final judge or censor ought not to be included with them. It is well you have published the alleged facts; they contain many warnings. But putting the above case on one side for the present, I would ask, Are not many errors in judging caused by neglect to clear the place of exhibition soon enough l It is nothing unusual at some shows to find the officials nearly an hour behind the notified time for clearing; chiefly, it is presumed, because one or two exhibitors have arrived late, and have not finished staging. This is grossly unfair to those who do try to abide by the regulations, as they cannot safely leave their exhibits until the place is cleared, and the judges are hurried round in order to get finished before the time to admit the public. All such rules should be carried out to the letter. If any exhibitors are not ready, let them be disqualified; they will learn to arrive in time at the next exhibition.

The best arrangement I have seen in this matter is that practised at Birmingham Chrysanthemum Show. A notice printed in bold type is sent to each exhibitor a day or two before the show, saying that the rule as to time will be strictly enforced. A bell is rung as a warning to be ready about ten minutes before the time, and the hall is cleared

punctually and quickly when it is rung again.

The above is the only reason I can think of for many mistakes in judging which one sometimes meets with. A few years back at a very large show I remember two dishes of Sea Eagle Peach in one collection of fruit were shown under distinct names, one of them being selected with less colour than the other. Good judges ought to find out and disqualify those who do such tricks, but if they are pressed for time they cannot reasonably be expected to do so. It is a pity such cases should occur, but as long as there are shows there will doubtless be a few dishonest exhibitors who are not ashamed to rob their neighbours. There ought to be some means of punishing them by law for this, I consider it quite as bad as picking a man's pocket.

If I understand your article rightly on page 503 you say the judges' decision cannot be altered after the public are admitted. If this holds good, how are judges' mistakes to be rectified in the future?-

W. H. DIVERS, Ketton Hall Gardens, Stamford.

THE article on page 503 throws a search light of electric power on the case in question, and places the matter, so far as it has gone, very clearly before the public. Although the verdict has been found, sentence will presumably be deferred until all the side lights have been turned on what is undoubtedly a momentous subject.

As a judge and exhibitor of some years' standing may I be allowed to make a few comments and offer a suggestion? The case appears to resolve itself under two heads—viz., error or incompetence. I need not dwell on; the leading article deals with that so con-But error or difference of opinion, which the so-called error may resolve itself into, allow me to turn on a side light from afar off truly—viz., ancient history. "Long, long ago, beyond the space of twice a thousand years," Jupiter, in a merry mood, showered down on mortals a number of spectacles, which each fitted on (no two were alike), and each mortal since has been comeplled to wear them, though invisible; hence, till Jupiter takes back his gift, we mortals shall never see things alike.

Another side light. Given two exhibitors, each complying with the rules, each with blooms of about equal merit, the deft hand of one exhibitor will with neat arrangement and finish in setting up add a grace and charm to his stand which his opponent fails in doing, though on analysis of the individual blooms this does not count, but in close competition does not this influence the judges, and should it not receive consideration? It does from the public, and they are no bad judges. I have seen the humble man from a single-handed place, practically unknown and unnoticed, the first to put up his stand, the last to leave it, giving a touch here, another there, while my lord's gardener disdaining these trifles, dishes up sans ceremonie and sans goût, but to find later on that these little things are not to be despised, and do carry

weight.

Who, as an exhibitor, when clearing out for the judges does not give a final look, and take the measure of his opponents with his eye? I do, and am seldom far out in this premature judging. After that, unless anything glaring should be found, which I never have, I do not question the judges' decision, and though not always getting the expected place, at other times the unexpected falls to me, and any seeming error either way I attribute to Jupiter's spectacles, which we, the judges, and even experts, are condemned to wear. My suggestion is that the National Chrysanthemum Society should formulate and publish a clearly defined code of rules for the help and guidance of judges, which would undoubtedly be recognised as the standard of all societies. committee of judges nominated by Mr. Molyneux, himself acting as Chairman, is an alternative suggestion.—E. K.

THERE can be no doubt that the show referred to on page 503 last week was that of the Scottish Horticultural Association, and the allegations contained in your correspondent's letter demand an answer from me as Secretary.

Your correspondent states two facts, viz.: first, that "The Committee so far entertained the protest as to appoint a competent expert to 'point' the different stands;" and, second, that "The Secretary told the 'protestors' that the Committee acknowledged the misjadgment, but, owing to a clause in the rules, viz., 'The decision of the Judges is final, nothing could be done in the matter."

To both of the above "facts" I have to give a most emphatic

When the disappointed competitors handed me their protest it denial. was laid before a meeting of the Committee, and it was resolved that the Committee had no power to call in question the decision of the Judges, in whose skill and integrity they placed every confidence; and this decision was communicated to the "protestors."

As this matter must be brought before my Committee, in justice

to myself I think it but right that the name of your correspondent should be placed in my hands. The other remarks contained in your editorial do not call for my criticism, and therefore I pass them over for what they are worth.-ROBERT LAIRD.

We are obliged to Mr. Laird for informing the public that the Show alluded to was that of the Scottish Horticultural Association, held in Edinburgh on the 16th, 17th, and 18th ult. Our correspondent of last week sent us his name and address, assuring us of the accuracy of his statement, which he desired us to publish. He did not mention the name of the Society, nor did we know it when our last issue was published. It was in no degree material that we should know it. It was a question of what Mr. Laird describes as "facts," but which we described as allegations, these being of such an extraordinary nature, yet stated with such precision, as to demand attention. We placed our pages open for any counter statement, and as readily insert Mr. Laird's communication as we did that of the writer whose accuracy is so emphatically denied. The Committee, he says, did not appoint an expert to point the blooms after the Judges, and did not acknowledge any "misjudgment." Who then appointed the "expert," the result of whose irksome duty we published last week? Our correspondent will note Mr. Laird's request for his name and address. We have no objection to these being furnished for placing before the Committee as suggeste 1.]

CRYSTAL PALACE SEPTEMBER FRUIT SHOW.

I AM pleased to see in your last issue that "H. W. W." (page 508) draws attention to these once popular gatherings of pomologists, the discontinuance of which has indeed been a great disappointment to both fruit growers and exhibitors generally. Like "H. W. W.," I was for some years an exhibitor at these shows, and always looked upon them as being the best managed and best conducted of any in my experience of exhibiting.

I endorse every sentiment "H. W. W." has expressed in his desire to urge the Crystal Palace Company to renew their September Fruit

Show, and if they will do so I can only say that I for one will endeavour to support them.—AN OLD EXHIBITOR.

I TRUST there will be not only a strong backing-up of "H. W. W.'s" appeal (page 508) for a resuscitation of the September Fruit Show, but also that a sort of memorial from a large number of fruit growers will be prepared, signed, and sent to the Crystal Palace Directors in favour of the suggestion. Let "H. W. W." prepare the memorial and sign it, then send it to the Editor, who should be authorised by fruit growers all over the kingdom to attach their signatures, sent on specially provided slips, and it could then be forwarded to the Crystal Palace Directors. It is so obvious that not only has no other show been found a substitute for this exhibition but there is less probability than ever in the future that any substitute will be furnished anywhere in or about London. The opportunity is an excellent one for the Directors to resume their proper position in relation to the National Autumn Fruit Show.—D.

MESSRS. E. D. SHUTTLEWORTH & CO., LTD.

ALTHOUGH but some three years or so have elapsed since Messrs. E. D. Shuttleworth & Co., Ltd., first established themselves at the Albert Nurseries, Peckham Rye, they have obviously made great progress, and the firm now occupies a prominent position amongst metropolitan nurserymen. Visitors to exhibitions held in the metropolis, also in the provinces, have often had their attention drawn to the meritorious exhibits staged by this firm, and these, with the judicious management of the Chairman of the Company, Mr. Charles Hicks, have done much towards building up a growing business. The Albert Nurseries are situated about half a mile from Honor Oak Station, and rather more from Peckham Rye, both on the London, Chatham, and Dover Railway, Messrs. C. Hicks, H. Wigley, and T. Baker being the directors. To meet the increasing demands several large glass structures have recently been built, and these, together with many other houses and numerous pits and frames, are filled with healthy plants of various

descriptions.

Being growers for the wholesale as well as retail trade Messrs. E. D. Shuttleworth & Co. carry on an extensive business in ornamental foliage and flowering plants suitable for decorative purposes. Palms for example are strongly represented, and we are keeping within bounds in saying that so far as these are concerned the firm can hold its own perhaps with any in the country. Thousands of plants in all stages of growth may be seen, including seedlings an inch or so in height to those magnificent specimens 10 or more feet high, which have embellished so many exhibitions during the past two or three years. It is impossible to enumerate the whole of the species grown, but it may be mentioned that of such popular kinds as Cocos Weddelliana, Geonoma gracilis, Kentia Canterburyana, K. Belmoreana, K. Fosteriana, Latania borbonica, and Areca lutescens there is an enormous stock. Asparagus plumosus nanus is largely grown, there being an almost insatiable demand for this decorative plant, and the same applies to the best of the Dracænas. The last-named plants are characterised by a clean healthy appearance, and bear the impress of skilful cultivation. Crotons, too, receive special attention, as a glance at the beautifully coloured foliage will testify. If further corroboration were necessary we have it in the fact that the firm has on several occasions procured first prizes for these plants when exhibited. Only the best are kept in stock, and thousands of young plants are annually propagated. What has been said in regard to Palms is applicable to Ferns, which appear to have more than ordinary notice given them. Several houses are devoted to their culture, and it may be observed that immense numbers of the best decorative kinds are raised from spores. Some plants of A. farleyense in 6-inch pots were exceedingly healthy, as also were Pteris tremula Smithiana, and Davallias of various kinds. Ornamental foliage Begonias are not forgotten, there being a good demand for these plants; also Araucaria excelsa, Aralias in variety, Marantas, Aspidistras, and Cyperuses. As is now well known Cycads are a specialty at the Albert Nurseries, and some splendid specimens of C. revoluta have been exhibited by the firm on several occasions. Other foliage plants deserving of individual notice are Poinsettia pulcherrima variegata, Abutilon foliis variegata, Souvenir de Bonn; also the new Sonerila Baron Sallier and Phrynium variegatum, a plant worthy of more extensive cultivation.

Whilst so much attention is given to ornamental foliaged plants it must not be thought that those usually grown for their flowers are overlooked. The latter are cultivated quite as extensively as the former, and equally as well. Roman Hyacinths and Lily of the Valley are now blooming profusely, while the early Duc Van Thol Tulips are already showing their brilliant blossoms. Large consignments of well-ripened crowns of Lily of the Valley, with bulbs, are imported from abroad, and apart from the forced flowers during the winter and spring, a rising trade is done in roots through the autumn. Messrs. E. D Shuttleworth & Co. also import thousands of Ghent, Mollis, and other Azaleas, and many of these are now expanding their flower buds in a genial temperature. Others, again, are temporarily planted in beds for furnishing a later supply and meeting the demands for imported plants that arise. Orchids are grown in good numbers, as also are Zonal, Ivy-leaved, and other Pelargoniums. An immense stock of Marguerites in pits attracts notice, and Gardenias are well represented, the plants being clean and healthy. Ericas in variety, double Primulas, Bouvardias, and Cyclamens

are also extensively grown.

Messrs. E. D. Shuttleworth & Co. have a branch nursery at Fleet, Hampshire, over which Mr. Wigley presides, and here, the Journal representative was informed, hardy plants, Roses, Coniferæ, forest and fruit trees, are grown in large numbers. About two acres of ground are devoted to the culture of Daffodils, which give promise of becoming a leading feature in the business. Carnations and Dahlias, with other popular flowers, likewise have attention, all the newer varieties of these being cultivated. Much more could be said in regard to this thriving business, but the foregoing will suffice to show the firm merits all the attention that has been given. It is worthy of mention, however, that comprehensive and well arranged catalogues of general plants, bulbs, and seeds are issued by this firm, and these, like the plants, deserve more than a passing glance.

DESSERT TABLE COMPETITIONS.

The points raised by Mr. E. Harland in connection with this subject (page 519) may perhaps appear confusing to some, but to my mind the matter is clear and simple enough, as it hinges upon the query, Can a dessert table be considered "completely laid out" if no fruit or other accessories are placed upon it? Decidedly, yes, as the custom of not placing fruit upon the table is a rapidly extending one. True, there are hosts of families among whom the older custom of placing both fruits and sweetmeats upon the table still lingers. That, however, does not prove a dessert table to be incomplete without them, any more than that a dinner table would not be considered "completely laid out" unless the viands were placed upon it. In my opinion, therefore, the Judges at the Hull Chrysanthemum Show rightly awarded the first prize to the table which was acknowledged to be the best artistic arrangement, and I fail to see how a protest for disqualification could have been sustained by the point raised.—H. Dunkin.

On first reading the paragraph contained in the Hull Chrysanthemum schedule, one naturally comes to the conclusion that the exhibitor who had no dishes of fruit in his exhibit for dessert table decoration would render himself liable to disqualification. But, on closer scrutiny, it is plain that the Judges would not have been justified in disqualifying such exhibit, as it would be quite in conformity with the wording of the schedule. One has no doubt as to what was in the minds of the Committee when arranging for this class, though the Judges cannot take into account any intentions of the donors of such prizes, but must give their decision according to the exact wording of the schedule.

The clause is very explicit as to what flowers and foliage are to be used, but not a word as to what kind of dessert fruit, or how many dishes, "if any," were required; the word "completely" contains, no doubt a good deal of meaning, but to have its full significance the clause should read, "completely laid out, with not less than 'so many' dishes or varieties of dessert fruits."—GEO. WOODGATE, Warren House Gardens,

Kingston Hill, Surrey.

It is very evident that the problem propounded for solution by Mr. Harland is more one for logicians than for table decorators. Custom or rule does not bind the case. It is to be determined by interpretation of words. Those of primary importance are "dessert" and "completely. Now, with regard to the first, what is a dessert table? Clearly one at which people sit to partake of whatsoever of fruit, sweets, and drinks, may be placed before them. Now, we have hundreds of dinnertable competitions florally dressed, but because "dinner-table" did anyone ever hold that in any such competition there must be placed on the table dishes of meats, entrées, poultry, fish, vegetables, and sauces? Of course no one. It is held that dinners are not now so served, but rather are furnished à la Russe. That estimate has always been excepted, and no one perhaps has ever held that because called "dinner"-table the presence of the usual accompaniments of a dinner were essential. We have but to apply the same rule to a "dessert" table, and the solution of the problem is found.

Besides, it is evident that "fruit," or the ordinary concomitants of a dessert, was not in the minds of the framers of the schedule, or they would have so expressed themselves. On the other hand, Chrysanthcmum flowers and foliage are specially enjoined. It is so obvious that the prize is given for the best floral dressing, because the form or material of dressing is strictly enjoined. Then as to the interpretation of the word "completely," who would undertake to assume when or how a table was completely furnished with dessert? Say it is for six persons, should the dessert include a Pine, white and black Grapes, Pears and Apples, Oranges, dried fruits, nuts, swects, biscuits, and wines. Does not all this paraphernalia present itself to any sensible person's mind as preposterous? Indeed, were it bound to be furnished, it is but too evident that the judgment of the tables would be more contingent on the fruits than on the floral decorations and their style of arrangement. That it is not now the ordinary practice at small dinner tables to place all the dessert on the table—a vicious practice—but to hand it round from the sideboard, shows that in merely furnishing plates, knives and forks, and one or two trivial dishes, that the principal decorator merely wished to convey the idea, as intimated in the schedule, that places at the table were furnished for six people, and that number only. That was his interpretation of the word "completely," and it would seem to be the only logical one.

A dessert table does not mean one dressed with a dessert. Had such been expected it would have been specially provided for. What was required is what is fully expressed in the quotation from the schedule,

"Only Chrysanthenums, with any hardy foliage, to be used in its decoration." The word "only" settles the business.—A. D.

MR. HARLAND has given us a very queer nut to crack. If the framers of the prize schedule of the Hull Chrysanthemum Show had tried to word the conditions governing the class for a "dessert table," so as to cause confusion among both exhibitors and judges, they could not well have done it more effectively. Personally I am inclined to agree with those judges who, when they have to decide a knotty point, lean towards sustaining the framers of schedules in what they intended should be understood by certain conditions, and not towards those of the exhibitors who prefer to put their own, and perhaps a very different construction upon the wording. In particular would I favour what has been accepted as the right construction in former years. In the course of a fairly long career as an exhibitor I have been either disqualified or lost points more than once for putting my own construction upon the wording of certain rules, and can therefore sympathise with those who also have to suffer if not exactly for "conscience sake," at any rate for "backing their own opinion."

"backing their own opinion."

As a Judge I thoroughly dislike disqualifying exhibits, though it has to be done occasionally; and all things considered I should have hesitated about voting against the table at Hull on which there was no fruit. If it had been worded "only fruit and Chrysanthemums, with any kind of foliage to be used," there could have been no mistaking the conditions; but unfortunately fruit was left out, and this gives a good opening for a lawyer. Candidly I think the Judges took the only way out of the difficulty. It is unfortunately too true that in some quarters it has become the custom to keep the dessert off the table, this being served very much as the earlier part of the dinner is done. This practice is to be commended in all cases where the dessert will not bear much inspection, but is not likely to prevail where the host or hostess has some good home-grown fruit to offer. By all means serve Grapes without bloom, bruised Pears, shabby Apples, and imported fruit generally from the sideboards; but if my brother gardeners are well advised they will endeavour, to the best of their ability, to keep up the old custom of placing some of the best of their fruit on the table. Not only does it add greatly to the general effect, but it often leads to an acknowledgement—that is to say, a commendatory notice from the guests, and subsequently the master or mistress as the case may be.

If 1 intended to compete for the prizes offered at Hull I should certainly feel justified is using four good dishes of fruit, both because the wording admits of this being done, and more especially because I am certain that would gain me a few points with the Judges. Seeing that the wording of the schedule must stand, my advice to the Hull Committee is to let matters take their course, beyond intimating to the Judges, if they are different to those engaged this year, that there must be no disqualifying tables, whether fruit is or is not used in their decoration, providing the competitors adhere to the other conditions. They have established a precedent, which ought now to stand till the end of the competition.—W. IGGULDEN.

WITH Mr. Harland, I fully agree that the first prize was rightly awarded to Mrs. Douglas Joy, of Welton Hill, her table being much the best artistic arrangement of Chrysanthemums and foliage, and that, I take it, is the principal object for offering these prizes. Yet, on the other hand, I must entirely differ from Mr. Harland when he states that "if a protest had been entered, this table must have been disqualified," because, forsooth, it was not "completely laid out." In this instance, what a bugbear that word "completely" can be made. Was every exhibitor to load her table with all the known wines and cordials, also all the home and foreign fruit, both fresh and dried, that our fruiterers could supply? I think if such were the case there would be a terrible crowding out of everything in the way of floral decorations. Your correspondent wishes "to know what is the correct view." I quote the following from "The Gentlewoman" (no mean authority, by the way):—"Fruit is not often put on the table for dessert, but instead very small dishes of salted almonds, olives, and French bonbons."—A YORKSHIRE BITE.

REFERING to "Dessert Table Decoration," I have come to the decision that fruit and every requisite should have been placed on the table to accord with the wording of the schedule. At Southampton, as far as I can now recollect, it mentions in the schedule, "in the dessert table class," that fruit need not be placed on the table. I do not see how a table can be complete without the fruit and all requisites.— F. W. FLIGHT, Cornstiles, Twyford.

I THINK a Judge would take a bold step if disqualification was enforced because a table was devoid of fruit in its adornment. I know of no rule that bids the placing dishes of fruit on the table. This is entirely a matter of personal taste, and in the absence of such a rule the laying down of individual law is liable to bring complications. I have repeatedly seen tables this year win premier honours that had no fruit on them beyond dishes similar to those described by Mr. Harland on the winning table at the Hull Show.

The main point in awarding the prizes for table decoration is to recognise the greatest skill and taste in disposal of the flowers allowed. It would be a peculiar law, I think, that permitted an exhibitor to take a premier honour with an arrangement of flowers of diverse colours, as well as being huddled together, for the reason that it contained a solitary dish or two of any ripe fruit which its opponent, intentionally or

—"The Great Stor Harding, F.R.Met. Soc."

On Changes in the Bombay Water "On Changes in the Bombay Water".

otherwise, had omitted. In the absence of definite instructions that dishes of fruit must be employed, I cannot see how disqualification can be supported. I have examined many schedules containing classes of this kind, and in nearly all the conditions are similar to those named in the Hull schedule. The definition applied to the words, "completely laid out," I take it means that such articles as plates, knives and forks must be present.—E. MOLYNEUX.

[Those letters from exhibitors, judges, secretaries of shows, and accomplished table decorators, are overwhelmingly in favour of the interpretation of the conditions by the adjudicators at Hull—Mr. Cypher of Cheltenham, and Mr. Hudson of Gunnersbury.]

THE WEATHER IN LONDON.—Much rain has fallen in the metropolis since publishing our last issue. A slight frost was apparent on Sunday morning, but as the day advanced it rained heavily. Monday proved fine, but on Tuesday it was very squally. Wednesday opened wet, and at the time of going to press the weather is very unsettled, but mild.

— Weather in the North.—There has been very little frost during the past week, but many sleet showers and much high wind. Throughout Thursday night and all Friday a gale from the southwest blew, causing much damage to property, and Saturday was also gusty with heavy showers of sleet. Roads were slippery, and driving difficult from frost on Sunday morning, but there was high wind and drizzle in the evening. Monday was the best day of the eight, and this morning (12th) the ground is white with snow.—B. D., S. Perthshire.

— Mons. Ed. Ortgies,—It is announced that Mons. Ed. Ortgies, who for the last thirty-eight years has been Curator of the Botanic Gardens, Zurich, is about to retire into private life, and will resign his office on April 1st, 1894. As a young gardener, Mons. Ortgies served at Chatsworth, also in some of the London nurseries, and was a foreign member of the Royal Horticultural Society.

— RUGBY AND DISTRICT HORTICULTURAL SOCIETY. — May I, through your columns, express to those exhibitors who so kindly gave their spare blooms and fruit to the stall held at our late Show on behalf of the Royal Gardeners' Orphan Fund, and also to Messrs. E. D. Shuttleworth & Co. for sending a case of small Ferns and Palms for the same object, our Committee's sincere and hearty thanks, and to state the amount realised was £6 17s. Sd., a cheque for which has been forwarded to the Hon. Secretary to the Fund.—WILLIAM BRYANT, Sec.

THE SEASON.—What is to be done with regard to the more "precocious" belonging to our herbaceous plants? Many of these are pushing vigorously—bulbous plants, too. I have already gathered Crocuses, shallow planted ones of course. My idea is to have a supply at once at hand of cocoa-fibre refuse, and when serious frosts attack us to drop it into the centre of the plants, and for 4 or 5 inches around them. Do not put it on before it is absolutely necessary. Pæonies are very hardy, but still the early growth must be susceptible to frost. Whatever should be put on must be light stuff, and dry.—J. A. W.

THE DECEMBER NUMBER OF "CURTIS' BOTANICAL MAGAZINE" has just been received by us. It contains representations of Amorphophallus oncophyllus, Eulophia Zeyheri, Protea rhodantha, Abutilon vitifolium, and Eria Meirax.

— WE acknowledge the receipt of the Christmas number of Sylvia's "Home Journal," which is a most tastefully arranged and profusely illustrated sixpennyworth, and conspicuous among the exceptional numbers issued at this season.

—— ROYAL METEOROLOGICAL SOCIETY.—At the next meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 20th inst, at 8 P.M., the following papers will be read:

—"The Great Storm of November 16th to 20th, 1893," by Charles Harding, F.R.Met.Soc. "Rainfall and Evaporation Observations at the Bombay Water Works," by S. Tomlinson, M.Inst.C.E, F.R.Met.Soc. "On Changes in the Character of Certain Months," by A. E. Watson, B.A., F.R.Met.Soc.

- "KEW BULLETIN."—We have received a copy of the "Kew Bulletin," Appendix 1894, which contains a list of such hardy herbaceous annual and perennial plants as well as of such trees and shrubs that have matured seeds under cultivation in the Royal Gardens, Kew, during the year 1893. These seeds are available for exchange with colonial, Indian, and foreign botanic gardens, as well as with regular correspondents of Kew. The seeds are only available in moderate quantity, and are not sold to the general public. It is desirable to add that no application, except from remote colonial possessions, can be received for seeds after the end of March.
- ROYAL BOTANIC SOCIETY.—At a meeting of this Society, held on Saturday last, in the gardens at Regent's Park, Mr. Arthur Rigg in the chair, it was reported that the donations received since the last meeting included specimens of the peculiar tropical ants inhabiting Myrmecodia Beccari, living plants of which are already in the gardens. These plants are remarkable as affording food and shelter to certain genera of ants in return for the protection they are able to give against the attacks of injurious animals or insects. It is stated that H.R.H. the Duke of York has been made a Fellow of this Society.
- A TRANSATLANTIC contemporary states:—Three of the largest Japanese Maples in America are now standing in Prospect Park, Brooklyn. They are said to be among the first of these trees sent there by the late Mr. Thomas Hogg, and are now, perhaps, 35 feet high, with a corresponding trunk circumference. Although they are beginning to be crowded they are fine trees, and during the late autumn they are especially beautiful. This late retention of foliage is a peculiarity of East Asian plants, and it should be taken advantage of when planting for autumn effect.
- STAPELIA GIGANTEA.—This wonderful species, according to Mr. W. Watson, in the "Garden and Forest," has recently flowered freely in a stove at Kew, and some of the star-shaped flowers measured a foot in diameter. While it may be taken as a general rule that Stapelias prefer a dry atmosphere with plenty of sunlight and warmth, there are exceptions, and S. gigantea is one of them. Until this plant was placed in a moist stove along with the Palms and Aroids, where it had shade in bright weather and plenty of water at all times, except for a few weeks in midwinter, it never flowered. There is something fascinating about the flowers of Stapelias, dull though they are in colour as a rule, and disagreeable, too, in odour, but when these flowers are a foot across, tawny-red in colour, hairy, and not too disagreeable in odour, they are worth a place in every stove collection. S. gigantea is as interesting in its way as Aristolochia gigas Sturtevanti or Victoria regia.
- LILIES AND THEIR CULTURE.—This was the title of an able lecture delivered before the members of the Wakefield Paxton Society at their ordinary weekly meeting on Saturday, December 2nd. The lecturer was Dr. Clarke, M.A., of Headingley, Leeds, Professor in the Agricultural Department at the Yorkshire College, Leeds. Dr. Clarke is an authority on horticultural and agricultural matters. He has a hobby in the culture of Japanese Lilies. The lecturer named many of the best varieties of Lilies suitable for indoor and outdoor cultivation in this country, and by means of chalk illustrations on a black board he showed the best mode of planting Lilies in pots, strongly recommending the use of peat, sandy compost, and rape dust. He deprecated the practice of plunging pots of Lilies and other bulbs in ashes, saying that the rain frequently washed sulphurous matter out of the ashes into the bulbs, and this had a damaging effect. He preferred clean and dry straw to either ashes or cocoa fibre dust, this being a safer material for the purpose in question.
- MISSOURI BOTANICAL GARDEN.—We have received a pamphlet containing the fifth announcement of the pupils at the Missouri Botanical Gardens, St. Louis, U.S.A. Previous to entering the garden the pupils must pass a preliminary examination. Pupils are lodged in comfortable rooms in a spacious dwelling adjoining the garden, under the charge of a competent employé of the garden. The lodging-house includes a reading-room supplied with horticultural and agricultural papers, and also with a collection of books on the same subjects, of which the pupils have free use. So far as possible, the surroundings of pupils are made home-like, and without assuming any responsibility for their behaviour, an effort is made to subject them to influences calculated to insure for them habits of industry and investigation. During the first year of their scholarship the pupils work at the practical duties of the garden nine or ten hours daily. After the first year, one-half of each day is given to manual work, the remainder being devoted to class work.

- A BOTANIC GARDEN FOR CARDIFF.—It is reported that the Parks Committee of the Cardiff County Council recently passed a resolution to the effect that £500 be voted for the purpose of erecting a glass house, and for buying a collection of herbaceous plants to form a botanic garden in connection with the Roath Public Park.
- PRESENTATION TO MR. W. BAILEY.—We learn that on the 6th inst. the employés at Southwark Park, S.E., presented Mr. Bailey, until recently superintendent of the park, and now of Dulwich Park, with a handsome electro-plated cruet stand. The foreman, Mr. F. Bright, made the presentation on behalf of the men, and wished Mr. Bailey success in his new appointment.
- THE WATFORD CHRYSANTHEMUM SHOW.—I was somewhat surprised to read in your last issue (page 512) that Mr. Gleeson, The Warren House Gardens, Stanmore, had been awarded a set of fish carvers for the best exhibit in the Show. Mr. Colchester offered the above as a special prize for the best exhibit in the Show grown with a specified manure, but too late to appear in the schedule, consequently the Judges considered it would be wise to hold over the prize till next year, and did not award it to Mr. Gleeson, but I suppose Mr. Colchester has done so personally. I do not object to Mr. Gleeson having the prize in fact, I congratulate him on receiving it, but I do object to him saying it was for the best exhibit in the Show. The Judges alone should decide this.—One of the Committee.
- LIVERPOOL HORTICULTURAL ASSOCIATION.—On Saturday evening last the members of the above Association held their seventh annual dinner at the Adelphi Hotel, Lime Street; but in consequence of the large amount of sickness prevailing many old friends were missed, and the company, which numbered seventy-four, was only about half the usual strength. Mr. W. Tunnington, in proposing the toast of the Association, spoke of the great difference of the exhibits of sixteen years ago and the present time, more particularly the Chrysanthemums. He referred to the good work the Association had done in disseminating knowledge in horticulture amongst the young gardeners, and hoped it would go on prospering in its work. Mr. T. White, the Chairman of the Association, briefly responded, and regretted that their splendid exhibitions were not more patronised by the public.—R. P. R.
- DOYENNE DU COMICE PEAR FROM A NORTH WALL.—Very good samples of fruit of this fine Pear so produced were shown by a local gardener at Limpsfield, Surrey, on the occasion of a lecture on fruit culture by one of the County Council lecturers last week. The fruits were larger than what are often found on wall trees on a warm aspect, but even so late as November 22nd were far from being ripe, and would be probably be at their best a month later, whilst the flesh was excellent. It lacked softness and the fine flavour which so characterises this grand Pear. That such fruit would be produced on a north wall in ordinary seasons is doubtful, indeed in this case the tree had not borne before the present year. It is very obvious all the same that some good Pears will and do produce good fruit on a north wall, and it may be with a view to prolong the Pear season, all too short this year; to also grow more on north walls than is at present the case.
- BIRMINGHAM AMATEUR GARDENERS' ASSOCIATION.—The present session of this Association was brought to a close on Wednesday, 6th inst., when Mr. Alderman Wm. White, J.P., gave his Presidential address at the Temperance Institute. There was a good attendance, but not so many as there should have been to hear such an enthusiast in gardening matters, who as Chairman of the Parks Committee is Birmingham's "head gardener." He chose for his subject "Gardens, Gardeners, and Gardening." His connection with a garden commenced fifty years ago, when he used to enjoy many a chat with his father's gardener. As to gardeners, he had always found them a very genial class of mcn; but he thought rather addicted somewhat to calling their employers' plants and fruit "my this" or "my that." In the case of his own gardener (for he said he was only an under gardener now) he held that he had a right to style them as partly his own, and when the gardener spoke of "my Grapes," he turned and said, "Oh! they are not yours entirely, for they partly belong to me." However, to turn to gardening, he said that times had greatly altered when he was a youth; very few at that time had a greenhouse. At the conclusion of his address, Mr. Griffin proposed and Mr. Roe seconded a vote of thanks to the President for his very interesting address. Messrs. E. D. Clarke, Gosling, W. B. Griffin, and R. F. Rees exhibited plants and flowers, and the usual awards were made. The silver medal for the highest number of points during the year has been won by Mr. Gosling, the bronze medal by Mr. W. B. Griffin.

- —— TRAPPING BULLFINCHES.—A few weeks since I noticed Mr. Hiam was writing about trapping bullfinches. Will Mr. Hiam say if the trap cages can be easily made, or where they can be bought?—J. E.
- Mons. L. GILLEKENS.—We are informed that Mons. Gillekens, who has been Director of the Ecole d'Horticulture of Vilvorde for twenty-six years, has tendered his resignation. Mons. Gillekens will, we understand, retain his present title as an honorary distinction.
- A LARGE PAULOWNIA.—Mr. George Canby writes that he has since made an accurate measurement of the great Paulownia or Empress Tree in Independent Square, Philadelphia, and he finds at 3 feet from the ground it is 9 feet in circumference. As we ("Meehans' Monthly") happen to know that this is probably the oldest tree in the United States, it will be interesting to learn if there is a larger one or not in the country.
- THE ROYAL HORTICULTURAL SOCIETY OF IRELAND .- A special meeting of the above Society was held on December 4th at the office, 15, Lower Sackville Street. The following members of Council were present:—Sir Percy R. Grace, Bart., D.L. (in the chair); Major Cusack, J.P.; Mr. Edmund D'Olier, Mr. F. W. Moore, Mr. William Dick, Mr. George Casson, J.P.; Mr. C. Strong King, J.P.; Mr. George Ross, M.A., B.E.; and Mr. Hamilton Drummond, J.P., Hon. Sec. The following resolution was passed:—"That the members of the Council of the Royal Horticultural Society of Ireland desire to express their deep regret at the death of His Grace the Duke of Leinster, their late President, and their sincere sympathy with Her Grace the Duchess in her bereavement, and that a copy of this resolution be sent to Her Grace.—(Signed) Percy R. Grace, Bart., Chairman." The following were elected annual members of the Society: - Major A. Mansfield, Morristown Lattin, Naas, Co. Kildare; Mrs. Adam Findlater, Primrose Hill, Kingstown; John M'Entaggart, Esq., Highfield Manor, Rathfarnham and Lower Sackville Street.
- CALIFORNIA AND AUSTRALIA CANNED FRUITS.-A horticultural magazine of Melbourne, Australia, calls attention to the fact that Australia may become a close competitor with California in furnishing dried and canned fruits for exportation to the old world. Peaches, Pears, Plums, and Apricots find themselves very much at home in Australia; and the freight from there to the old world is little, if any more than the freight from California. For some reason or other, the enterprise in prosecuting these branches of fruit business has never been very successful in Australia; but our contemporary states that during the past year or two a great advance has been made in this branch of fruit economy, and that at least one firm in South Australia has been remarkably successful in making profitable ventures in this line to the old world. In some branches of agriculture the Australians have become close competitors with America for portions of the trade of the world; and it would look, from the facts above noted, as if they were destined in the future to come closely into competition with an industry which has been almost a monopoly for California.
- THE WEATHER LAST MONTH IN SCOTLAND. Mr. G. McDougall, Stirling, writes: - The total rainfall here was 3.417 inches, which fell on eighteen days, the greatest fall being 0.950 inch on the 16th. Frost was registered on nineteen days. Warmest day, 54.2° on the 27th; coldest day, 35.5° on the 18th; warmest night, 49.8° on the 29th; coldest night, 21° on the 21st. Mean maximum, 45 6°; mean minimum, 31.4°. The terrific gale of the 18th will long be remembered as the most disastrous experienced in this district for a long time. Nurserymen will be busy before they can supply the demand that is sure to arise if only some of the trees blown down are replaced. On the Abbey Craig, which belongs to the town of Stirling, more than 3000 trees are uprooted. In some parts they are literally packed above each other. Mr. Lunt, gardener at Keir, told me that all their finest specimens are down. Some of the woods at Airthrey have the appearance as if a battery of artillerymen had been practising amongst them. It is the same cry from all quarters, "What a destruction among our woods! The finest of our trees are lying prostrate, trees which we cannot replace."
- WHITE EARWIGS (page 511).—I have often observed earwigs of a lightish colour, but they were always under cover, and, when disturbed, they endeavoured to get out of sight as soon as possible. I have always attributed their lightish colour to a new change of garments. Some of the Carabis beetles, too, may be seen with their elytra white and soft, but these again are newly emerged from the chrysalis.—G. MACDOUGAL, Stirling.

- —. A GIFT TO DUNDEE. We understand that Messrs. R. B. Laird & Sons of Edinburgh have offered to the Council of the City of Dundee as a gift glass houses, trees, and shrubs, valued at £4000. It is stated that the houses are those at Coates Gardens, Edinburgh.
- Two Crops of Grapes in One Season. California is especially favoured in many ways. It seems to be the Paradise of fruit growing. It does not seem to be generally known that they have two crops of Grapes often in one season. At the present time, according to an American contemporary, one of the questions with Californian fruit growers is whether it really pays to allow the Grapes borne upon the later wood growth to mature; some believing that the drain on the vitality of the Vine injures it for the future, while some contend that the plant is just as strong in after years where these two crops are taken as it would be with only one.
- WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY .-On Thursday, the 7th inst., under the chairmanship of Mr. H. Corlett Mr. R. G. Waterman gave an interesting account of various noted horticultural places he had visited during the summer-viz., Impney Hall, Droitwich, the chief features being the Chrysanthemums and fernery; Appley Towers, Isle of Wight, mention being made of an unusually large Fig tree carrying an enormous crop; Messrs. Drover's, Fareham, and their Chrysanthemums; Swanmore Park, where Grapes were very fine, but the great feature was the Apple trees, carrying such a heavy load as to necessitate their being propped. He finished an interesting paper by mentioning the Earl's Court Exhibition and the Crystal Palace Fête. Although a departure out of the ordinary run of the meetings, it proved of great interest, as showing many different methods and ideas at the places visited. Mr. Stoney and Mr. Carling followed with a few remarks. The usual votes of thanks terminated the meeting.—R. P. R.
- FRUIT MACHINERY.—When we consider the vast difference between the price of labour in American gardens and orchards, and the low prices paid in the Old World, it is a matter of surprise to foreigners that we, says an American paper, can compete so successfully with them in their markets. They attribute it to our fine climate and good soil, yet there are not wanting some intelligent fruit cultivators who believe that these conditions are just the reverse, that America has probably the worst climate in the world for the successful growth of fruits, and that it is simply American genius which overcomes these difficulties, and thus gives them the command of the world's markets. But it is in the Far West, and especially along the Pacific slope, where thousands of acres are devoted to fruit culture, and the fruit industries are among the most profitable of the States' revenues, that this adaptation of art to overcome Nature is more apparent perhaps than in the Eastern States. Sometimes we see praise given to the systems of education in effect in the Old World as compared with that popular in America; but if the proof of the pudding is in the eating, American education seems to have decidedly the advantage.
- THE ANTWERP EXHIBITION. Arrangements are now in progress for the adequate representation of Great Britain and Ireland at the forthcoming International Exhibition at Antwerp, which is to be opened in May next, and of which the King of the Belgians is the patron, and the Count of Flanders the President. The Exhibition includes industrial, scientific, and artistic productions, maritime, colonial, and African sections; and shows of agricultural products, flowers, and fruit. The site of the Exhibition is a plot of land of 200 acres, near the river Scheldt, and connected with all the principal railways, and the main buildings cover 120,000 square yards. The Governor of Antwerp is the President of the Executive Committee, and the Belgian Government has appointed a Commissary-General. The British Government has authorised Mr. De Courcy Perry, Her Majesty's Consul-General in Belgium, to act as Commissioner-General for Great Britain, and he has nominated as the Antwerp Committee the Lord Mayor, Sir Frederic Leighton, P.R.A., Alderman Sir David Evans, Sir George Birdwood, Mr. Kennedy, C.B., Colonel North, Mr. Walter H. Harris, Mr. A. Agelasto, Mr. James Dredge, Mr. John Morgan, and others. The scheme has received the warm approval of the London Chamber of Commerce and the Associated Chambers, and a programme indicating their co-operation will shortly be issued. information will be supplied in London by the Chamber of Commerce, and in Antwerp by the British Consul-General. To co-operate with the Chamber of Commerce an important Committee has been formed by M. Rogier, Belgian Vice-Consul in London. Many of the exhibitors at Chicago are sending their goods direct to Antwerp.

OSTROWSKIA MAGNIFICA.

In a note on Ostrowskia magnifica, which appeared in the Journal of September 28th (page 282), I referred to the difficulty of preserving

Mr. J. N. Gerard, of Elizabeth, New Jersey, U.S.A., the writer of the article, very kindly sent me a copy of "Garden and Forest," which was followed by a letter giving further information. In the meantime I had been in communication with the Rev. H. Ewbank, who is not easily

Fig. 77.—OSTROWSKIA MAGNIFICA.

and flowering this plant, and asked for information regarding it. On page 355 an extract from the American "Garden and Forest" was published, giving the experience of a correspondent of that journal in its cultivation, in which he had been successful. Shortly afterwards

baffled in the culture of hardy flowers, and, as I expected, special treatment is required in order to grow and flower this undoubtedly fire plant.

Mr. Ewbank says it should be dried off in the summer in situ. He

does it by placing a piece of glass over it after flowering, and it appears that Herr Max Leichtlin says that it requires this treatment. The experience of Mr. Gerard also points to the necessity of a period of rest in summer. His plant is grown in an Oncocyclus Iris bed, a raised border against the south wall of the dwelling house, where plants can be kept perfectly dry from time of ripening until well into August. There (New Jersey) the Ostrowskia does not start into growth until well into April, and hard frosts are not experienced after the first week in that month.

This information would point to a bed devoted to Oncocyclus Irises being one of the most suitable positions for the Ostrowskia, these Irises also requiring a period of perfect rest. The early starting into growth of the Ostrowskia, which in this neighbourhood we also experience with the Eremuri is not so easily remedied, and I fear for this we shall have to protect for a little while in the early spring. It still remains to be seen whether our cooler summers in the north will give sufficient heat to ripen this plant. The summer heat at Baden Baden, New Jersey, and Ryde must be considerably greater and more prolonged than we can expect further north, but we must make another attempt to attain success with an uncommon flower.—S. Arnott, Dumfries.

[This plant, flowers of which are depicted in the illustration (fig. 77), was exhibited by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, at a meeting of the Royal Horticultural Society in July, 1888, when a first-class certificate was awarded for it. It is stated that Messrs. Veitch & Sons first flowered Ostrowskia magnifica in this country.]

THE RASPBERRY MOTH (LAMPRONIA RUBIELLA).

The small red caterpillars of this moth are most destructive to Raspberry canes. The culture of Raspberries has enormously increased, as they have proved in some seasons to be a most profitable crop; their enemy, the Raspberry Moth, has multiplied in a proportionate degree. The production of this valuable fruit has been much decreased by its action in some seasons, and it has been consequently considerably dearer than other fruit, Currants, Strawberries, and Cherries, for instance, as seen by the higher prices charged for Raspberry jam when the insect has been troublesome. On many fruit farms the crop has been reduced from one-third to half in consequence of the attack of this insect. Fruit farms in Kent and other counties have been visited in the spring, upon which at least half of the buds of the Raspberry canes had been destroyed. In some of the buds the caterpillars were still actively working, in some they had changed into pupæ. This is frequently the condition of many Raspberry plantations in England and Scotland. Much mischief is often occasioned also in gardens and allotments where patches of Raspberry canes are cultivated.

Upon close examination of the attacked Raspberry canes, it will be seen that the soft juicy part at the base of the buds has been eaten away, so as to kill the buds and prevent their foliage and blossoms from being put forth. There is also a hole in the cane at the base of the buds, in which the pupa will be found ensconced.

DESCRIPTION OF THE MOTH.

The Lampronia rubiella, or Raspberry Moth, belongs to the family Tineidæ, of the group Tineina. It is a most beautiful moth, of a light brown colour, with a series of spots like burnished gold upon its fore wings. The hinder wings are slightly lighter in colour, with light fringes. It is barely half an inch across its wings, and its body is only about the fourth of an inch in length. It may be seen towards the end of May, or the first week of June, flying round the Raspberry canes.

LIFE HISTORY.

The moth places her eggs upon the flowers of the Raspberry canes at the end of May, or in the beginning of June. After five or six days the caterpillar may be found in the raised white receptacle upon which the fruit, or more correctly the collection of little fruits composing the Raspberry, is formed. The caterpillar does not appear to injure the fruit, nor, indeed, to feed at all at this time. Mr. Stainton, in his "Manual of Butterflies and Moths," says that the caterpillar hibernates without feeding. When it is fully grown the caterpillar makes its way out of the receptacle, either by crawling or by letting itself down by silken cords to the earth beneath the canes, and passes the winter in a case, or kind of cocoon. It emerges from this state of hibernation on the first approach of spring, and crawls up the Raspberry canes, and getting to the buds, worms itself into these at their bases, and makes up for long autumn and winter months of fasting by feeding upon them. In 1892 caterpillars were first found in Raspberry buds on April 10th. Dr. Chapman states that the caterpillar leaves the hibernating cocoon in March, early or late, according to the season.

When the time arrives for pupation, the caterpillar scoops out a hole in the pith of the canes, just below the bases of the buds, in which it turns to a chrysalis.

From a quantity of pieces of Raspberry canes, whose buds were badly infested with caterpillars, sent on the 8th of May, and kept in a glass case, moths came forth on the 9th of June. That there might be no

possible doubt as to their identity, some were sent to Mr. Stainton, who pronounced them to be Lampronia rubiella.

The larva is close upon a quarter of an inch long, decidedly pink in colour for the most part, though the shade of colour varies somewhat in individuals, and becomes more rcd in most larvæ as they get older. The head is black. There is a patch of black on the first segment. It has three pairs of black feet on the thoracic segments. The pro-legs number four pairs, and there is a pair of anal feet.

The pupa is exactly the fourth of an inch long, tapering somewhat unusually, and has a curious spine upon the back on the last segment.

METHODS OF PREVENTION AND REMEDIES.

The caterpillars are just under the surface of the ground, around and among the stocks of the Raspberry canes. As it has been shown, they remain there from about midsummer until March. Therefore, forking the ground round and between the stocks deeply with a pronged fork, or even hoeing it with a three-toothed hoe would destroy some and bury others so deeply that they could not get forth.

others so deeply that they could not get forth.

Dr. Chapman has suggested the following practical method of prevention: "The caterpillars are in the crown of the stock, or near it, and under rubbish there collected. Rake this away, and earth the stock up again, and you will thus bury them, and most will

perish."

Soot, lime ashes, or soot and lime mixed, which form a pungent compound, might be forked or hoed into the ground in the autumn or winter.

Raspberry canes in field culture are nearly all cut away, so that there are but few canes or stems left. It would be easy, therefore, to put a little thick softsoap composition containing paraffin oil, or carbolic acid, or some other offensive stuff, with a large paint brush, upon the lower part of each cane that is left, in order to prevent the caterpillars from crawling up. They are very small, and the least obstruction of a disagreeable nature, it is believed, would stop their progress.

Cutting off and burning the infested stems while the caterpillars are in the buds or receptacles, between April and the middle of June, would destroy many caterpillars. This may be very freely done, as Raspberry canes throw up plenty of shoots to take the place of those cut away.—

(Board of Agriculture.)

FLORAL NOMENCLATURE.

RESPECTING scientific names (page 495), if young men during the probation of bothy life embraced those golden opportunities seldom recurring afterwards by a little steady and continuous application of spare time to self culture we should not hear so much of bad spelling. Many do, I know, but there are very many more who do not, who would not think of going into the field of knowledge after the day's work in the houses or garden is over, and there delve a little for themselves by digging up a few of those dry old Latin roots. To those who do, how they bud forth into leaves and flowers; concealed under those hard names, what a hitherto hidden world is revealed to him. It may have to be done under difficulties. I have experienced some in settling myself in the corner of a small bothy kitchen of a winter's night with four playing with cards on the table, and one solitary candle between us. I know the fifth part of that luminary seemed very small to me, but

"He who hopes th' Olympic prize to gain, All arts must try and every toil sustain."

Relative to the names of florists' flowers, could not some protection be given by special societies? For instance, could not the National Rose Society persuade the raiser of, say, Souvenir de Mons. Andre Leroy d'Angers that his Rose by any other name would smell as sweet? or the National Chrysanthemum Society that L'Enfant des Deux Mondes would not suffer if deprived of its two worlds, or, vice versâ, the two worlds might do without the child? These are stumbling blocks that trip up old gardeners as well as young ones, and those who will persist in so baptising their progeny must not only expect liberties taken with them, nor be surprised if they get so mutilated that they fail to recognise their own children.—E. K.

THE POLLINATION OF PEARS.

I AM, as must be many of your readers, much indebted to Mr. Abbey for his suggestive article (page 506) on the "Pollination of Pears." The subject appears to have been neglected in this country, while it has been forced upon the attention of Americans by their custom of planting large areas with single varieties. This has enabled them to discover that certain varieties under such circumstances do not become fertilised, although the same varieties elsewhere are well known to be fertile.

It is difficult for an amateur to derive from a mixed collection, where many varieties are grown together, much experience as to the matter at issue; yet I venture to give some little, not because of its value, but that it may induce others to give us the benefit of theirs, as I believe the subject is well worthy of discussion. To take some of the Pears mentioned by Mr. Abbey: Beurré Giffard, an excellent Pear and valuable for its season, although perfectly healthy, very rarely sets its fruit with me, while Williams' Bon Chrêtien or the Bartlett, as invariably bears a large and regular crop; Beurré Clairgeau, quoted as imperfectly staminate, is retained in my collection solely for its

beauty, when annually loaded with its handsome fruit; it is never eaten here.

I fully agree with Mr. Abbey that Comte de Lamy is the best of all Pears. It has every merit that a Pear should possess, not excepting size, which is most convenient for biting. Every Pear to be enjoyed perfectly should be bitten, large juicy Pears cannot be so eaten comfortably. Jersey Gratioli with me sets its fruit regularly and so abundantly that it has no energy left to make young wood; there is no Pear more refreshing. The fartility of family these descriptions are the Pear more refreshing. The fertility of fruit trees depends on the perfect development of the blossom, and this may vary with soil, situation, or climate. Therefore it is not difficult to understand that a variety, which in some circumstances does not develop its anthers, may, under other conditions, perfect them, and so some of the discrepancies referred to in Mr. Abbey's article may be explained.

Mr. Abbey teaches the lesson to make an accurate record of the dates of the blossoming of the Pear, and at the same time to note down carefully the condition of the fertilising organs; and if it be found in a tree otherwise healthy, but unfruitful, that the anthers are imperfect and deficient in pollen, to plant in the neighbourhood of that tree a variety which produces pollen in abundance, and in the meantime, until the latter is in a condition to assist the tree deficient in pollen, to try the experiment of fertilising it by artificial means with foreign pollen.— E. Tonks, Knowle, Birmingham.

MR. MOLYNEUX IN IRELAND.

I AM grateful to Mr. Molyneux for the kind expressions (page 516) in his courteous letter on Ireland, and considerably soothed besides. He has, figuratively, taken the shillelagh out of my hand. Being behind the scenes whilst he was on the stage that exciting day in Dalkey, I was privileged and pleased to hear the vox populi unanimously vote him "A jolly good fellow." That is a fact, and not blarney from—PADDY.

INCURVED JAPANESE CHRYSANTHEMUMS.

RELATIVE to the article in the Journal of Horticulture, November 30th, page 497, as I was the winner of the first prize at Reading alluded to by "Beginner," I must say neither Gaspard Rozain, nor Mdlle. Marie Hoste were exhibited in my stand. I should not think of putting either in as an incurved Japanese. Perhaps it would be as well for "Beginner" to be sure before he states anything in print. If necessary I can give the names of all blooms exhibited in my stand,—G. LANE, Highfield, Englefield Green.

CHRYSANTHEMUM FLORENCE CARR.

I SEE a "Grower" (page 515) is inquiring where Florence Carr can be obtained. It may interest your readers to know that I have secured the stock, and the variety, with others, is being advertised.—W. WELLS.

CHRYSANTHEMUM ROBERT PETFIELD.

MR. R. OWEN writes, "An error has crept into your notes (page 514) regarding the parentage of this incurved Chrysanthemum. It is not a sport, but a seedling from Princess of Wales of my own raising." In justice to Mr. Owen, who is to be complimented upon the introduction of such a sterling novelty, I hasten to make the correction.— E. MOLYNEUX.

CHRYSANTHEMUMS AT PHILADELPHIA, U.S A.

AT this Show, the first prize for six new varieties never before exhibited was awarded to my old friend, Mr. H. B. Surman, of Germantown. The same grower was also awarded a silver medal for Mrs. W. A. Reed, an orange-yellow Japanese of the Golden Ball type, and a certificate of merit for another new seedling named Dr. Herbert M. Howe. The flowers of this variety are of fine "Elkhorn" form and good pink colour. Mr. Surman is well known as the raiser of many of the best American varieties .- CHAS. LAWTON, The Gardens, Welton House, East Yorkshire.

CHRYSANTHEMUM CHAS. DAVIS.

By altering a phrase and passing it off as a quotation "Querist" (page 497) now limits his grievance to the statement that the unsuccessful blooms were "perfect in shape, fresh, and equal in size" to those that secured the award. It is precisely here where we differ. The winning blooms were not faded; they were only paler in colour, and so far as size is concerned they were much larger blooms altogether than those which appear to have captivated the eye of "Querist."

As to point judging at the Floral Committee, I am not aware that such a system is supposed to prevail there at all. Their only rule is that when more than one exhibit of the same variety is staged the award shall be to the one in the best condition. What "best condition" means is for them, or the majority of them, to decide. As I have said before, the Committee certificate the variety, not any particular tone of colour the flower may assume. Of course, "Querist's" individual opinion may differ, but when well-known exhibition flowers are staged for certificates size must tell, and evidently did so in this case.—P.

CHRYSANTHEMUM MDLLE. THÉRÈSE REY.

I AM pleased to find Mr. Molyneux (page 514) places this beautiful new white Japanese in the foremost place of novelties. It seems to me to be amongst white what E. Molyneux is amongst dark varieties. It is a distinct departure from the too common forms in whites, either dense petalled reflexed of the Avalanche style, or else incurved like Stanstead White. Mdlle. Therese Rey was one of the very best shown at the Royal Aquarium last week. It keeps its true character to the last, and does not, as some others do, vary its proper form with age. The florets are broad, flat, and very pure, but are not too long, as is the case with so many varieties. With so very many new Japs showing incurved form, and Robert Owen is the best of that strain yet, it is rather refreshing to find such a delightful variety in the white Mdlle Thérèse Rey, that is so very "Japanese" in character.—D.

THE N.C.S. AND ITS CERTIFICATES.

BECAUSE I referred to the fact that the Royal Horticultural Society sometimes sit in a bad light "A Mummer" (page 497) jumps to the conclusion that I am trying to argue that they always do so. One thing is certain, whether they meet an hour earlier than the National Chrysanthemum Society or not, that it must have been very bad on November 14th, when your reporter says it was impossible to see the true colours of the flowers. I should like to know where fair daylight can be depended on in Local during November, and all I intended to point out was that the N.C.S. is not the only Society that suffers from

what none of us can help.
"A Mummer" finds the R.H.S. more lavish than the N.C.S. in the matter of certificates, and hopes the latter will not follow suit. I fail to see why. The one is not essentially a Chrysanthemum Society, the other is. The novelties exhibited at the N.C.S. must be far more numerous than those staged at the Drill Hall, and what would be more feasible than to find the National awarding a larger number of certificates? If they do not do so, and "A Mummer" seems to know, it only shows what I have already stated, that a very rigid system of selection is carried out by the N.C.S., and that the standard now required is a very high one.—P.

NATIONAL CHRYSANTHEMUM SOCIETY.

THERE was a meeting of the General Committee of the above Society on Menday last at Anderton's Hotel, Mr. R. Ballantine occupying the chair. After reading the minutes of the previous meeting the Chairman mentioned that there was only one matter arising out of them, and it referred to the suggestion of holding the Society's Show elsewhere than at the Aquarium. He had visited two places suggested, but they were quite unsuitable, not only in regard to size but also in the price required. He would be pleased to inspect any building that members thought appropriate, but he felt that no terms equal to those offered by the Aquarium Co. could be obtained, and that the Society was not in a position to hold its shows entirely on its own account.

The awards of the Arbitration Committee at the December Show were then confirmed, consisting of a gold medal to Mr. H. J. Jones, silver-gilt medals to Mr. W. Wells, Mr. R. Owen, Mr. Henry Perkins; and silver medals to Messrs. Chard, N. Davis, E. Stevens, Rowbottom, Waite, Witty, and Cannell & Sons for exhibits of Chrysanthemums, and other flowers. The Secretary presented the interim report of the Schedule Sub-Committee, from which it was gathered that arrangements have been concluded with the Aquarium Co. to hold exhibitions in 1894 in October, November, and December, and that the Society will receive £300 towards the prize money. The dates fixed are as follows:—
10th, 11th, and 12th October; 6th, 7th, and 8th November; and 4th, 5th, and 6th December.

The financial statement showed receipts to the amount of £650, and the reserve fund has been increased to upwards of £50. Thirteen new members were elected. The paper by Mr. C. E. Shea on judging was then read by the Secretary in the absence of the author. It was a lengthy but interesting review of the present system, and contained

suggestions for a new method to be authoritatively set up by the N.C.S. This paper will appear in the schedule for the ensuing year.

NEW CHRYSANTHEMUMS.

(Concluded from page 514.)
Van den Heede.—The colour of this is peculiar, being that of cherry wood, the reverse buff lake. The florets are perhaps a trifle short, the flower is exceptionally full and solid.

Le Verseau.—When developed from what is known as late crown buds this may be termed a refined Etoile de Lyon. The florets much resemble that variety in formation, while they form a full solid flower, in every respect possessing much quality; in colour rosy lilac, the tip

of each floret is white when expanding.

Thomas Wilkins.—This resembles Mrs. F. Jameson in form, the florets are however longer, the flower full and solid. In colour it is golden bronze—a promising variety.

James Myers.—This is an English raised seedling. In form it reminds one of Flamme de Punch. The colour is rose.

Rose Wynne.—Incurving florets of extra width, blush, heavily

veined with rose pink. A large loosely formed flower.

Madame R. M. Ricoud. - Narrow flat florets, rose lilac, tipped white, a

full solid bloom; most promising.

Golden Wedding.—Although yellow flowers are tolerably plentiful in this section, there is room for more when they possess the sterling quality of this American raised variety. Rich orange yellow is the shade of this. The florets are narrow at the base, widening towards their extremity and incurving at the points.

International.—This is a giant in size, even moderately well grown blooms measuring 8 inches in diameter. The florets are flat and broad, with a semi-drooping character; lilac in colour, with rich purple

stripes.

Miss Muriel Scott.—The lower florets are golden bronze, the centre

pale yellow. A full and pleasing variety.

C. Vere Flood.—The result of a cross between Mrs. F. Jameson and Puritan, and retains some of the character of both. In form the florets partake of the former. The colour is deep purple rose, mottled white in the centre.

Thomas Hewitt.—This variety is deserving of notice on account of its great keeping property. The florets are broad, and incurve thoroughly, giving it a massive appearance. The colour is white, flushed and striped

with rose.

Mrs. J. Hammill.—Like the foregoing, this belongs to the incurved section. The florets, too, are of massive proportion. In colour they are creamy white, suffused with rose.

Pearl Beauty.—An American seedling, raised in 1892. The florets are ivory white and heavy in appearance, belonging also to the incurved section.

Madame Adolphus Chatin.—As an incurved Japanese, this should prove valuable to the exhibitor. The florets are broad and pure white; with age they become tinged with pink, adding to their appearance.

Middleton Clarke.—This variety has reflexed florets, rose crimson in

colour; promising.

Sautel, 1893.—Sautel adding the year of introduction to its name must have thought highly of it. The florets resemble those of Comte de Germiny in formation. The colour is lilac on the reverse, rose inside.

Silver Cloud.—An American raised variety, quite unique in point of colouring, which reminds one of the outer covering of a pale coloured Mushroom, the florets are broad, and remind one of late flowers of Mdlle. Marie Hoste in their form.

Niveum.—Dwarf in habit of growth, the florets are strap shaped,

pure white, and full flower.

Madame Isaac.—This is also pure white, the flat sword-like florets are numerously disposed, making a full solid bloom, quite promising.

H. Hammond Spencer.—Named by Mr. Jones after the Devonshire

exhibitor. It is a full flowered rose lilac bloom.

exhibitor. It is a full flowered rose fllac bloom.

Duke of York.—The plant is of dwarf growth, carrying very large blossoms; the colour, magenta, is showy, suffused with silver. The points of the flat florets incurve, giving the bloom much character.

Le Prince du Bois.—This was raised and exhibited by Mr. C. Gibson, which is a guarantee of its worth. The colour is pleasing, rich yellow, fading to a lighter shade with age. The florets are narrow, twist slightly at the points, and have a semi-drooping tendency.

Miss Alice Wilson.—An improved Stanstead Surprise, the colour being richer, while the blooms have more substance: a decided gain

being richer, while the blooms have more substance; a decided gain.

Kentish Yellow.—Perhaps the best of yellows, the florets have an inclination to incurve. It is devoid of anything approaching coarseness, the rich colour is decidedly pleasing.

Professor Whitmack.—We have not too many varieties of this colour—rose magenta, therefore this should become popular with arbibitors. The reverse is silver which is plainly seen until the blooms. exhibitors. The reverse is silver, which is plainly seen until the blooms are fully expanded, as they at first incurve. The blooms are not extra large, but possess quality.

Primrose League.—This provides the exhibitor with blooms for the back row, they being extra large. The colour is creamy white, primrose

centre, as the florets develop.

Lizzie Cartledge.—Bright rose pink, reverse silvery white, late crown buds develop blooms with even flat florets, a trifle pointed, the whole

possessing much merit.

Dr. Brigham.—The blooms of this American variety resemble Avalanche in form, except that it is not quite so compact. The colour is creamy white, with a blush suffusion at the base. As an early flowering variety it deserves a place in collections.

Joan Farwell.—Rich crimson, very bright, reverse gold, the florets narrow and serrated at the points, curling slightly also; a full, solid

bloom.

C. Shrimpton.—This is best described as a dull coloured E. Molyneux.

The florets resemble those of this variety in formation.

T. W. Sanders.—The flowers are delicate yellow, and the florets are

narrow. It is not extra large, but perfect in all other respects.

Alice Seward.—Where incurved Japanese varieties are favoured, this English seedling is well worth growing. The colour of the stout florets

is rosy purple.

Potter Palmer.—This variety was in existence last season, but only in the hands of a very few growers. It is perhaps the purest white in existence; the florets at the base are tubular, those in the middle or body of the flower are lance shaped. Fully developed blooms measure 8 inches in diameter, and of corresponding depth.

Mrs. Robert Craig.—Another of American origin; the blooms are

large, pure white, incurved Japanese.

J. Whittle.—Flesh pink, deeper in the centre as the flowers expand; promising.

Mrs. A. G. Ramsay.—In colour this is Indian-red, tipped gold, which passes away with age; a full promising flower.

Mrs. Hillier.—The florets slightly incurve at the tips; in colour it is yellow in the centre, passing to primrose at the edge.

Principe de Trabia.—An incurved Japanese, rosy lilac; promising. Robert Owen.—The best of all the incurved Japanese section; the florets fold evenly over, forming a regular ball of bronzy yellow.

JAPANESE ANEMONE.

Several sterling novelties have been added to this section this season, rendering this class all the more attractive.

Sir Walter Raleigh.—This is furnished with handsome guard florets,

blush white, with a full rose-coloured disc.

Queen Elizabeth.—Lilac pink guard florets, with deep blush disc. John Bunyan.—The finest introduction in this section for years. It is best described as having a Gluck centre, with paler coloured long guard florets.

W. W. Astor.—High rosy yellow disc, tinted blush long flat guard florets. The above four varieties were raised by Mr. Owen, who is send-

ing them out.

LARGE ANEMONES.

Celtic.—Brassy lilac, full centre, short guard florets. Hibernius.—Bronze disc, pale yellow guard florets.

SINGLES.

A few have been added to the list of single-flowered varieties, of which the following are the most noteworthy:

Pattie Penford.—The florets are of medium length, semi-drooping,

and pure white. The disc is high, pale green in colour.

Dolly Varden.—The florets are rose magenta with yellow disc. A

remarkably free flowering variety of dwarf habit.

Rev. W. E. Remfrey.—Purple amaranth, florets cup shaped, very

Alice.—Creamy white, shaded blush, long flat florets.

Millie Agate. The base of the florets white, deepening to blushpink at the edges; good form.

HIRSUTE VARIETIES.

These have increased so rapidly of late that abundant material is

available now to form a separate class.

Hairy Wonder.—This is being sent out by Mr. Jones, and is considered by him to be quite one of the best in this section. The florets are broad, incurve thoroughly, and are more thickly covered with their hirsute appendages than any other variety. The colour is buff, suffused with chocolate.

Wm. Falconer.—A sport from Louis Boehmer. In colour it is a

blush pink, changing to lighter shade.

Queen of the Hirsutes.—Dull red, freely incurved, thickly covered with hairs.

L'Enfant des Deux Mondes.—This is a pure white sport from Louis Boehmer, and certainly the best of all the section.

W. A. Manda.—Rich orange yellow; points of florets incurve closely. The body of the flower, though, is rather thin.—E. MOLYNEUX.

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 12TH.

THE last meeting for the current year was held at the Drill Hall, James Street, Westminster, S.W., on the above date. There was a fair display, Orchids and Chrysanthemums being well represented. Fruit was also shown in good condition. Being the concluding meeting for 1893 votes of thanks to the Chairmen of the Committees were unanimously passed.

FRUIT COMMITTEE.—Present: Philip Crowley, Esq. (in the chair), and Rev. W. Wilks, Dr. Hogg, with Messrs. H. de Vilmorin, H. J. Pearson, G. Bunyard, G. W. Cummins, J. Cheal, G. Taber, T. J. Saltmarsh, W. Warren, A. Dean, W. Bates, A. J. Laing, J. Willard, G. Wythes, C. Ross, F. Q. Lane, J. Hudgerson, H. Balderson, G. Sage, A. H. Pearson, I. Smith and J. Wright, a large attendance as is usual A. H. Pearson, J. Smith, and J. Wright—a large attendance, as is usual at the last meeting of the year; also as is usual on such occasions, the

duties of the Committee were somewhat light.
D. C. A. Cave, Esq. (gardener, Mr. J. H. Stevens), Sidbury Manor, Sidmouth, Devon, sent a seedling Orange, Edith—beautifully shaped, fruits juicy, and delicious. The leaves attached to the fruits somewhat resembled those of Lemons. The tree is said to be a free bearer, and was raised from seed by Mr. Cave. A first-class certificate was

unanimously awarded.

Mr. Owen Thomas, The Gardens, Frogmore, sent a dish of large fruits of ripe Tomatoes, Frogmore Selected; also stems bearing fine clusters. A cultural commendation was awarded, and a desire expressed to see

samples in February.

Messrs. Lane & Sons, Berkhamsted, exhibited seventy dishes of well kept Apples, including splendidly coloured specimens of Lane's Prince Albert. A silver Knightian medal was recommended. Upwards of thirty dishes of excellent Apples from Messrs. John Laing & Co., Forest Hill, were marred in appearance by excessive polishing (bronze

Messrs. James Veitch & Sons sent very tall Brussels Sprouts with compact knobs, also bronze, green, and beautifully variegated Kales, and a vote of thanks was accorded. A small collection of vegetables from the Society's Gardens at Chiswick included specimens of the christmas Drumhead Cabbage; heads medium size, round and firm, said by Mr. Barron to remain in the same condition throughout the winter. plants were grown from seed sown presumably in May or early June. The variety has been grown at Chiswick for seven years without sustaining injury by frost. It is of French origin, and the leaves dark green. Mr. Bunyard grows this Cabbage, and values it highly for its hardiness and excellent quality in winter. An award of merit unanimously awarded. Mr. Osman sent a new form of Grape scissors, opening

with a spring; to be tried with other forms at Chiswick.

Before rising from the table the Chairman thanked the Committee for their attendance and support during the year. Dr. Hogg returned the compliment by proposing a vote of thanks to Mr. Crowley for his ability and urbanity as Chairman. This was passed with acclamation, and the last of the year's series of pleasant meetings was brought to a

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); Messrs. J. Laing, R. Owen, H. Herbst, R. Dean, H. B. May, C. F. Bause, G. Stevens, F. Ross, C. Jeffries, P. Barr, T. W. Girdlestone, J. D. Pawle, W. Furze, W. Bain, T. Godfrey, T. Baines, C. E. Shea, C. Noble, J. T. Bennett-Poë, G. Gordon, Jas. Walker, G. Paul, and the Rev. H. H. D'Ombrain.

Messrs. Hugh Low & Co., Bush Hill Park Nurseries, Enfield, staged a handsome collection of Cyclamens, comprising many splendidly flowered plants (silver Flora medal). A beautiful group of foliage and flowering plants was staged by Messrs. J. Laing & Son, Forest Hill. Prominent amongst the plants in this exhibit were Orchids, Crotons, Palms, Cyclamens, and Anthuriums (silver Flora medal). An attractive feature of the show were the Nepenthes shown by Messrs. J. Veitch and Sons, Royal Exotic Nursery, Chelsea. Particularly noticeable were N. Northiana, Chelsoni, mixta, cincta, Amesiana (first-class certificate; see below), Burkei excellens, and Morganiæ (silver Flora medal). H. B. May, Dyson's Lane Nurseries, Upper Edmonton, exhibited a charming collection of Ferns, in which Lomaria platyptera, Pteris Victoriæ, P. tremula Smithiana, Platycerium stemmaria (æthiopica) first-class certificate; Ncphrolepis davalloides furcans, and Polypodium nigrescens were the most striking (silver Flora medal). Mr. Robert Owen, Maidenhead, showed a table of Chrysanthemums in excellent condition. Amongst the best were Golden Wedding, Viviand Morel, Abbé Mendenhall, Secretary Farson, Niveus, Mdlle. Thérèse Pankoucke Mrs. Marian Bourne, and Good Gracious received awards of merit, and are described elsewhere (silver Flora medal). A botanical certificate was accorded to Mr. Bain, gardener to Sir Trevor Lawrence, for a plant of Massonia amygdalina in bloom. Costus igneus was also staged by the same exhibitor, and a first-class certificate awarded (see below). Mr. Bain also showed a basket of Primula Forbesi composed of profusely flowered plants. A small collection of Chrysanthemums was shown by Mr. W. Wells, Earlswood Nurseries, Red Hill. Mr. J. R. Tranter, Mr. J. R. Tranter, Henley-on-Thames, staged plants of Nicotiana affinis variegata.

From the Royal Gardens, Kew, came specimens of Manettia bicolor, Brownea Crawfordi X, Bomarea oligantha, Senecio macroglossus, Thunbergia (Hexacentris) Mysorensis, Bomarea pataccensis and Calpurnia aurea, the Natal Laburnum (a vote of thanks was adjudged). Specimens of Veronica Purple Queen were staged by Messrs. J. Veitch & Sons. Mr. Balderson, Hemel Hempstead, showed fine blooms of white and rose coloured Primulas, and also a bunch of a rich deep velvety crimson variety, which has a clearly defined circle round the eye of a much

deeper shade. It is a grand addition to these popular plants.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); Dr. Masters, Messrs. J. O'Brien, De B. Crawshay, H. M. Pollett, H. Ballantine, C. J. Lucas, T. Statter, E. Hill, J. Douglas, T. B. Hay-

wood, and J. Jaques.

Messrs. B. S. Williams & Son, Upper Holloway, N., staged a good collection of Orchids, comprising Cypripediums, Odontoglossums, Oncidiums, and a few Lælias. The group had a background of Palms, and Ferns were arranged along the front, the whole making an effective display (silver Banksian medal). Messrs. F. Sander & Co., St. Albans, sent a small group of choice species and varieties. Amongst these were the beautiful Lælia anceps Sanderiana, L. autumnalis alba, Cypripediums in variety, and Zygopetalum rostratum. An award of merit was adjudged for the last-named plant, which is described elsewhere (silver Banksian medal). Mons. Jules Hye Lysen, Gand, sent a plant of Cypripedium fascinatum, a grand form, for which a first-class certificate was awarded (see below). C. J. Lucas, Esq., Warnham Court, sent Cypripedium Warnhamensis, evidently a free flowering hybrid (award of merit). E. Ashworth, Esq., Wilmslow, Cheshire, staged Lælia anceps Amesiana (figured in the Journal of Horticulture last week) in good condition, and other Orchids. W. Wells, Esq., Bloomfield, Sale, had a fine spike of Cattleya exoniensis which attracted notice. Mons. Linden, Brussels, had a number of choice Orchids, including Lycaste Imschootiana (award of merit); L. Luciana (botanical certificate); Lælio-Cattleya Stchegoleffiana, and Odontoglossum crispum var. Thompsonæ (award of merit). A silver Banksian medal was recommended for the collection.

Messrs. J. Veitch & Sons exhibited a collection of Orchids, including Cypripediums T. B. Haywood, C. Leeanum, C. Enone (award of merit). A botanical certificate was awarded for Dendrobium glomeratum, shown by Messrs. Veitch. Baron Schröder was awarded a first-class certificate for Lælio-Cattleya Nyca, which is described below. Messrs. Hugh Low & Co., Clapton, sent a small group of Cypripediums and Odontoglossums, arranged with Palms (silver Banksian medal). Mr. J. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, staged a splendid group of Calanthes, and a silver Banksian medal

was recommended...

J. F. Ebrer, Esq., Woodlands, Beckenham (gardener, Mr. A. Waite) was adjudged an award of merit for Cypripedium Sallieri aureum. T. Statter, Esq., Stand Hall, Manchester, had some Cypripediums, as did R. J. Measures, Esq, the latter showing C. venustum Measurianum (award of merit) and Pleurothallis scapha (botanical certificate).

CERTIFICATES AND AWARDS OF MERIT.

Chrysanthemum Good Gracious (R. Owen).—A delicate rose-coloured

Japanese, with narrow somewhat twisted florets (award of merit).

Chrysanthemum Mrs. Marian Bourne (R. Owen).—An incurved Japanese variety, with broad silvery rose-coloured florets.

Costus igneus (Sir Trevor Lawrence).—A fine species, with large,

rich, orange-coloured flowers (first-class certificate).

Cypripedium venustum Measurianum (R. J. Measures, Esq.) .- A distinct form with rather small flowers. The upper sepal is white lined green, the petals and lip being yellow marked with green. The foliage is pale green blotched with a darker shade (award of merit).

Cypripedium Warnhamensis (C. J. Lucas, Esq.).—This is a very fine hybrid, said to be the result of a cross between C. Curtisi and C. lævigatum. The upper and lower sepals are similar in colour, being white veined with purplish crimson and green. The petals are twisted and are spotted, and suffused with dark purple. The lip is very large, and of a bronzy green shade. The plant exhibited bore two flowers on one spike (award of merit).

Cypripedium fascinatum (M. Jules Hye Lysen, Gand).—This is a splendid acquisition. The upper sepal large, white, suffused and spotted crimson, with a green base. The petals are spotted purple, and also have light purplish tips. The lip is very dark (first-class

certificate).

Cypripedium Sallieri aureum (J. F. Ebrer, Esq.).—This is the result of a cross between C. insigne and C. villosum. The flowers are mainly a shining greenish yellow, the upper sepal being spotted brown (award of merit).

Cypripedium Enone (J. Veitch & Sons).—The result of a cross between C. superbiens and C. Hookeri. The upper sepal is white and green, petals spotted and suffused purple, the lip being bronzy green (award of merit).

Lælia Finckeniana (C. W. Fincken, Esq.).—The plant of this that was exhibited had one spike carrying six flowers. The sepals and petals are pure white, the lip also, with a broad violet margin on the tip (firstclass certificate).

Lælio-Cattleya Nyca (Baron Schröder).—This bigeneric hybrid is the result of cross between Lælia crispa and Cattleya gigas, raised by Messrs. J. Veitch and Sons. It is a magnificent flower with large rosy mauve petals and sepals. The lip is a rich purplish crimson, and the throat pale yellow (first-class certificate).

Lycaste Inschootiana (M. Linden, Brussels).—A very distinct hybrid, being the result of a cross between L. Skinneri and Maxillaria The flower is a pale yellow shade, spotted crimson. The lip is a brighter shade than the other parts of the bloom, and the throat is richly spotted (award of merit).

Nopenthes Amesiana (J. Veitch & Sons).—This is a handsome hybrid between N. Rafflesiana and L. Hookeriana, the former being the pollen parent. The pitchers are short and very broad, the ground colour being green, profusely blotched with deep crimson (first-class certificate).

Odontoglossum crispum var. Thompsonæ (M. Linden, Brussels).—A grand variety of the well-known type. The plant shown bore a splendid spike of fourteen flowers (award of merit).

Platycerium stemmaria (athiopica) (H. B. May).—A handsome species, with large fronds of a bright green, covered with a silvery down (first-class certificate).

Zygopetalum rostratum (F. Sander & Co.).—An exceedingly pretty pecies. The lip is for the most part white, crimson lines starting from the base. The petals and sepals are white, tipped with pale brown (award of merit).

NATIONAL ROSE SOCIETY.—NEW CATALOGUE FUND.

SUCH of the subscribers to this fund as have not paid their donations will oblige by doing so at an early date to Mr. Charles Grahame or Mr. E. B. Lindsell, the Hon. Secretaries, who wish to close the list.

PROTECTING TEA ROSES.

I FIND nothing better than a mixture of burnt refuse and light soil. Three spadefuls of this dropped into the centre of the plant is better, I think, than the earthing-up system, for to earth up sufficiently must interfere with the surface fibrous roots, and if there be no such roots there has been a lack of good cultivation. The burnt refuse, too, in the spring, when pricked into the soil, serves as a valuable manure. Light dry litter straw or bracken form should be added later or Light dry litter, straw, or bracken fern should be added later on, weather demanding.—J. A. W.

ROSE PESTS AND THEIR ERADICATION.

It does not much matter what the time of year may be, we are sure to be able to find insect pests of some kinds upon Roses carrying young growth. Even under the most skilful treatment a few can generally be found. The above fact indicates how very necessary it is to adopt precautionary measures early, and although I do not wish to discourage growers by the formidable list of enemies and diseases it would be easy to name, it may be well to draw attention to a few of the most persistent pests the Rose is subject to. The whole secret of keeping Roses healthy and clean is to commence operations early, and I am quite certain that precautionary measures are invaluable. "I must fumigate soon, I see there are a few flies about," is a remark a friend of mine made use of while I was looking through his conservatory a few days ago. This will not do. Instead of "soon" it should have been at once. Why wait until the enemies have increased before commencing the fight? And yet this is the plain truth about delay. Not only is it easier to kill a few, but we avoid the injury they and their posterity would commit.

There are far too many enemies, and also too many remedies in the way of insecticides for me to name them all, so I propose to confine myself to a few general hints. The two most important of these are immediate operations as soon as the pests are discovered, and the freer use of insecticides of a weaker nature than usual. A very little should be contained in all the water the plants are syringed with, and this will be found a grand check to insect life. A free use of the syringe prevents any dust or other impurities from settling upon the foliage, and encourages growth. Green fly, thrips, red spider, scale, and other insects may be killed easily while in a young state, but when they are allowed to increase it is difficult to dislodge them. The older insects are also able to stand against stronger measures than would be safe to use upon the tender young growths which they affect with such disastrous results.

Among diseases under glass we must name mildew as the worst, but this can be cured if taken in hand at once. The first point is to decide upon the cause, and alter that; when this is done give a free syringing with a reliable insecticide to which has been added a little flowers of sulphur. Do not be persuaded into dusting over the foliage with sulphur. This has an unsightly appearance, is far less effectual, and wastes a great deal of sulphur. Mix the sulphur in the form of paste previous to putting it in the solution. It will then be easy to apply if the whole be kept on the move while using. In dusting the foliage it is impossible to do it uniformly, or to get the sulphur to adhere to the lower part of the leaves. This difficulty is surmounted when applied as I have directed above; when the foliage dries there will be a very slight dusting of sulphur left wherever the solution touched, and the unsightly appearance of dusting is avoided.—PRACTICE.

MESSRS. HARKNESS & SONS' ROSES.

WE notice Messrs. Cocker & Sons (page 509) take exception to "D., Deal's," remarks (page 494) re classes of seventy-two Roses, and wish to point out that the only exhibitions where during the season of 1893 prizes were offered for seventy-two Roses distinct were Crystal Palace, Gloucester, Hereford, Bath, Manchester, Wolverhampton, and Worksop, the first in each case being awarded to us. The class referred to by Messrs. Cocker at Tibshelf is for fifty varieties, whilst that at Elland is for twenty-four varieties, so neither are ever referred to in connection

with the great classes of seventy-two distinct.

With regard to the number of times Messrs. Cocker claim to have met us, there must be some mistake. We only competed against them at seven shows, four of which were in August, with the result that sixteen first and one equal first were awarded to Messrs. Cocker, and seven firsts, and one equal first were awarded to us, including the leading prizes at Newcastle and Trentham. At Tibshelf it may be interesting to state that we were beaten in the largest class by one point only, the total number of points being 109 as against 108. We were second for forty-eight distinct, equal first for thirty-six with Messrs. Cocker; we were also first for twenty-four blooms. We considered our Roses quite over by the last week in July, and only attended several of the August shows in response and repeated invitations from the secretaries. We feel we owe you an apology for occupying your valuable space for so trivial a matter.—HARKNESS & SONS.

MANURING AND TRANSPLANTING ROSES.

I HAVE read with interest the letter under this heading from "A Lover of Roses" (page 510), and should think a great deal of his advice is good and sound. But there are one or two points to which I should take exception. I think it is a mistake (though not an unusual one) to try to make a top-dressing of manure in the winter act both as food and protection—as a manure and as a mulch. If meant for a mulch, then long strawy manure would be better, and dead leaves the best protection from the frost. And surely the plants themselves require covering from frost even than more the roots; and this may be done in a far cleaner and more sightly manner, and also more readily, with leaves than with either long or short manure. If meant for food, some good will be done by the rain permeating the manure, but not much; you cannot expect much good from liquid manure in the winter, unless it be plentiful or very strong.

But it is the "forking" in of the manure in spring, after (as "A Lover of Roses" admits) the rain has washed the nutriment out, that seems to me a great and common mistake. It is a very usual piece of advice: "After planting, mulch the surface with manure for protection against frost" (some say "long manure," which would be the best protection, but would add to the after uselessness and hopeless struggles with the fork), "and 'fork it,' 'prick it,'" (I have seen "hoe it") "into the ground in the spring. Now, it is not only that the manure, being thoroughly washed and bleached by the rain and snows of winter, can be of very little service in the ground—but what I want to know is, how I am to "fork," "prick," or "hoe" in 3 inches of manure, whether long or short, so as to cover it, and yet not disturb the roots, which are

to be close to the surface, or put the manure in actual contact with them, which is well known to be prejudicial?

The roots of my Roses are horizontal and close to the surface, and I not only should not attempt such a job, but believe it to be of as little use as another one for which "A Lover of Roses" neglects precious planting time; and that is, gathering leaves as they fall. I know of no picture that shows a more striking object-lesson of waste of time than one I have often seen: a man sweeping leaves on a path or lawn, while they are in the very act of falling behind him as fast as he gathers them up. The great bulk of the leaves fall in ten days or a fortnight; an army could not keep the place elean during that time; and in many places a good sweeping wind, instead of adding to, saves labour eventually when the time comes for gathering them up.—W. R. RAILLEM.

NATIONAL ROSE SOCIETY .-- ANNUAL MEETING.

THE annual general meeting of the members of the National Rose Society was held at the Horticultural Club Room, Hotel Windsor, Victoria Street, S.W., on Thursday 7th instant. The Rev. W. Wilks occupied the chair, and there was a large attendance. Amongst others present were Sir Alexander Arbuthnot, Dr. H. Shackleton, Revs. F. R. Burnside, Page-Roberts, Foster-Melliar, F. H. Gall, H. A. Berners, Captain Christy, Messrs. C. J. Grahame, R. Bloxam, C. E. Shea, Colin Romaine, Cecil Cant, W. J. Jefferies, J. Bateman, F. Cant, G. Bunyard, G. Paul, E. B. Lindsell, G. Prince, J. Cranston, H. Merryweather, J. D. Pawle, H. P. Landon, R. E. West, H. Appleby, W. Boyes, J. Burrell, W. F. Cooling, R. L. Knight, G. Mount, A. Piper, A. Prince, A. Slaughter, R. H. Langton, G. Moules, W. H. Williams, J. T. Strange, A. W. Paul, with Rev. H. H. D'Ombrain and Mr. E. Mawley, the Hon. Secretaries, and Mr. T. B. Haywood, Hon. Treasurer. Messrs. Colin Romaine and Cecil Cant were appointed scrutineers of the ballot. Following this the report of the Committee for 1893 and the financial statement were read. Much discussion followed regarding the date of the provincial Show at Halifax, and many members expressed their opiaions on the subject. Mr. Lindsell said he had consulted some northern growers, including H. V. Machin, Esq., of Worksop, and Messrs. Harkness & Sons, Bedale, and they were in favour of July 12th, being anxious to meet the great southern rosarians. Mr. F. Cant said that if held on the 19th of July all southern growers would be excluded. Sir Alexander Arbuthnot, G. Paul, W. J. Jefferies, E. Mawley, and the Rev. H. H. D'Ombrain were in favour of the latter date, and it was eventually decided, by a large majority, that the Northern Show of the Society be held at Halifax on July 19th. The report and financial statement, which are published below, were adopted.

REPORT OF THE COMMITTEE FOR THE YEAR 1893.

The past season, owing to the continued drought and heat, proved one of the most disastrous for Roses and Rose shows that has been experienced for many years, so that notwithstanding the loyal support of the exhibiting members at the three exhibitions held by the Society, the blooms staged were, as a rule, much below the average in number, size, and quality. The competition at the Show of Tea Roses held at the Drill Hall, Westminster, was good, also in several of the leading classes at Worksop, but at the Crystal Palace there were fewer Roses than at any similar exhibition for nine years. In connection with the Worksop Show, some of the stands exhibited at which were exceptionally fine, it should be stated that the success of the Exhibition was greatly due to the admirable manner in which all the arrangements connected with it were carried out by the Committee of the Worksop Rose and Horticultural Society, especial credit being due to Mr. H. V. Machin, Vice-President, Mr. J. S. Whall, Hon. Treasurer, and Mr. G. Baxter, Hon. Secretary.

The new catalogue of exhibition and garden Roses was issued to members early in May last, and appears to have been much appreciated. Several foreign trade growers have already followed the Society's lead in introducing into their own catalogues a separate section for Hybrid Teas upon similar lines to that adopted in the Society's catalogue.

It is with much regret the Committee announce the loss the Society has sustained during the year through the death of one of its Vice-Presidents—the Rev. J. M. Fuller—whose valuable services as Chairman at their meetings will be greatly missed. They have also to deplore the death of Monsieur J. B. Guillot, a recently elected honorary member, and so well known to rosarians generally as the raiser of many of the choicest Tea and other Roses in cultivation.

Notwithstanding the great depression in trade which has prevailed throughout the country during the past year, the number of members as well as the number of affiliated societies has been well maintained; in fact, in no previous year, with the exception of 1892, have the present numbers been exceeded.

FINANCIAL STATEMENT.

The Committee congratulate the members upon the present satisfactory financial position of the Society. The amount in hand at the beginning of the year was £31 16s. 7d., and now at its close there remains £81 19s. 3d. to carry forward to the next account, the total expenditure having been £699 3s. 3d., while the aggregate receipts, including last year's balance, were £781 2s. 6d. It should here be stated that a special fund was raised early in the year among the exhibitors to defray the cost of printing and binding the new catalogue, so that no part of the cost of its publication has fallen on the ordinary funds of the Society. Although more than the usual number of changes

have taken place in the *personnel* of the non-exhibiting members the amount received in subscriptions was nevertheless in excess of that of any previous year.

-T. B. HAYWOOD, Hon. Treasurer.

ARRANGEMENTS FOR 1894.

In order to meet the requirements of exhibitors in all parts of the country, it has been decided by the Committee to hold next year a Southern Show, a Metropolitan Show, and a Northern Show. The carly exhibition of Tea Roses at the Drill Hall, Westminster, will therefore be discontinued, and a Southern Show be held instead of it at Windsor, in connection with the Windsor, Eton, and District Horticultural and Rose Society, on Wednesday, June 27th. The Metropolitan Show will take place at the Crystal Palace on Saturday, July 7th, while the Northern Show will be held at Halifax on Thursday, July 19th, in conjunction with the Salterhebble and District Rose Society.

MEMBERS' PRIVILEGES.

Members subscribing £1 will be entitled to two private view tickets and four transferable tickets, the latter admitting at the same time as the general public, while subscribers of 10s. are entitled to one private view ticket and to two transferable tickets. Each of these tickets is available for any one of the Society's Exhibitions. Members joining the Society for the first time next year will also receive a copy of the Society's new descriptive catalogue of exhibition and garden Roses. Members alone are allowed to compete at the Society's Exhibitions.

There are two classes of helpers to whom the Committee feel especially grateful. In the first place to those local Secretaries who have either secured for the Society new members, or, where this has not been possible, have done all in their power to keep within its ranks those they had previously obtained; and secondly, to all those who, by the gift of special prizes or by contributing to the prizewinners' fund for the new catalogue, have enabled the Committee to maintain the high standard of prizes offered in the schedules. Among the local Secretaries two are worthy of special mention—Mr. C. J. Grahame, late local Secretary for Croydon, who again secured for the Society a large number of new subscribers; and Mr. C. F. Hore, who has for many years rendered the Society such good service as local Secretary for Beckenham, and to whose zeal and energy the Society is indebted for the largest number of subscribers ever obtained by any individual member of it.

ALTERATIONS OF BY-LAWS AND REGULATIONS.

Following the usual resolutions passing votes of thanks to the Hort cultural Club for the use of their rooms during the past year, and to the officers and other members of the Committee for their services, several alterations and additions to the by-laws and regulations were made.

Mr. R. L. Knight first proposed an addition to be made to by-law 5, and after a discussion an amendment was moved by Mr. Bloxam, so that the addition to the said by-law will now read: "A general meeting of the Society may be called at any time on a requisition, signed by not less than twenty members, being delivered to one of the Secretaries at least fourteen days prior to the date of the proposed meeting. The requisition must specify the business for which the meeting is called, and no other business shall be transacted thereat." Mr. G. Paul seconded the proposition, which was carried.

Mr. Lindsell then proposed that by-law 12 should be altered to read: "The Society's regulations for exhibitions, 2, 5, 6, 7, 8, 13, and 14, are binding on all affiliated societies, and must either be printed in their schedules, or it must be prominently stated in them that their exhibition of Roses is held under the National Rose Society's regulations." Several members spoke on this point, and an amendment was moved by Mr. Jefferies, making it binding for all affiliated societies to print the N.R.S.

regulations in their catalogues. The amendment, however, on being put to the meeting was lost, so that the alteration in by-law 12 being eventually carried by a large majority will read as above.

Mr. G. Paul, after pointing out the necessity of such an alteration, next moved that regulation 6 be altered so as to read:—"The following Roses which are bracketed together are considered synonymous, and must not be shown in the same stand; for instance, Marie Finger must not be shown in the same stand as Eugénie Verdier:—

HYBRID PERPETUALS—

Charles Lefebvre
Marguerite Brassac
Paul Jamaiu
Comtesse de Choiseul
Marie Rady
Duke of Wellington
Rosieriste Jacobs
Eugénie Verdicr
Marie Finger
Exposition de Brie
Ferdinand de Lesseps
Mauriee Bernardin
Sir Garnet Wolseley

HYBRID PERPETUALS—

Grand Mogul
Jean Soupert
La Rosière
Prince C. de Rohan

TEAS AND NOISETTES—
Alba Rosea
Josephine Malton
Madame Bravy
Madame de Sertot
Souvenir de S. A. Prince

"The climbing variety of any Rose cannot be shown in the same stand with it; for instance, Climbing Devoniensis cannot be shown in the same stand with Devoniensis.

"N.B.—In bracketing varieties together, foliage and habit of growth are not taken into consideration." This proposition was, after being duly seconded, immediately unanimously adopted.

Mr. F. Cant moved that an alteration should be made in Regulation 14, and after some discussion it was proposed that it should read: "Hybrid Teas cannot be shown in the classes set apart for Teas and Noisettes, but may be shown amongst Hybrid Perpetuals, and in the mixed classes." Mr. Jefferies seconded this resolution, and it was unanimously carried.

Mr. West next proposed that the following new regulation be added: "In all cases where three trusses of each variety are required to be shown the three trusses must be arranged in the stand triangularly." Mr. C. J. Grahame said that in connection with this it would be advisable to have a clear understanding as to what was really meant by "triangularly." It was a question of more importance than many might suppose. Some years ago a dispute arose at the Crystal Palace as to what form the triangle should be—that is to say, whether the base, as it were, ought always to be at the bottom. The Rev. W. Wilks remarked that, in his opinion, the triangles would make a better appearance if placed alternately in the box. After being seconded the motion was carried.

Mr. J. Bateman, on behalf of Mr. A. Dickson, made a proposed alteration of note respecting "New Roses," to read: "In such classes by 'New Roses' are meant those offered for the first time in English nurserymen's lists in the spring of a certain year and subsequently; also named seedlings and sports not yet in commerce." A lengthy discussion took place on this point, and many members expressed their views. Mr. Bateman lucidly referred to the importance of the question, but the Rev. H. H. D'Ombrain thought the existing regulation would do, and was very unwilling to alter it, being sure Mr. A. Dickson would not mind if the proposition was not carried, as he had won the gold medals for new Roses. Mr. Grahame dissented, as did others, including Mr. E. Mawley, Mr. G. Mount, Mr. Jefferies, and Mr. G. Bunyard, the latter remarking that some further mark of recognition for new Roses would be a necessity a few years hence, inasmuch as after the past tropical summer many seedling Roses would be forthcoming. Mr. G. Paul seconded the proposition, and it was subsequently carried to read as above.

Mr. F. Cant, after the above alterations and additions in the bylaws and regulations were made, brought forward a personal matter. He said inasmuch as a report to the effect that Mr. Orpen had exhibited Roses from his (Mr. Cant's) ground had been circulated, he wished to give an absolute denial to the rumour. He did not think that the statement had been made maliciously; but, nevertheless, such would be damaging to him from a business point of view if not contradicted. Sir Alexander Arbuthnot deplored the action of the Society in deciding to discontinue the Exhibition of Tea Roses at the Drill Hall.

Sir Alexander Arbuthnot deplored the action of the Society in deciding to discontinue the Exhibition of Tea Roses at the Drill Hall. He thought that if precautions were taken, and announcement made through the Press, that the attendance at the Drill Hall on such occasions would be better. The Rev. Foster Melliar also regretted that no show of Tea Roses would be held at the Drill Hall next year. The Rev. W. Wilks remarked, as the matter had been brought forward he might say, although nothing to do with the present meeting, that the Council of the Royal Horticultural Society likewise regretted the step taken, but they had arranged that practically the same amount of prizes would be offered for Tea Roses at the Drill Hall on the day previous the Exhibition at Windsor.

The scrutineers having announced the result of the ballot was to the effect that the house list had been unanimously adopted, a vote of thanks to the Chairman closed the meeting.

THE ANNUAL DINNER.

AFTER the annual general meeting passed off so harmoniously, it was only fitting that the day should close with the annual festive gathering, which, after various alterations has come back to its original day. That the change was appreciated is evident from the fact that there was a larger attendance than there has been for a great many years past.

The President of the Society, the Very Rev. the Dean of Rochester, was unavoidably absent, but his place was ably filled by the Rev. W.

Wilks, one of the Vice-Presidents of the Society. The guests included a large number of both professional and amateur Rose-growers. It is not the custom at this dinner to have many toasts; in fact, except the loyal toasts and that of the Society, all else are excluded. The Chairman, in proposing that of the National Rose Society, congratulated the members on its success; a Society which in these days could show a balance of £81 was indeed in an enviable position. This was in no slight degree to be attributed to the admirable manner in which the Committee and officers of the Society have fulfilled their duties. He therefore proposed prosperity to the National Rose Society, and coupled with the toast the names of the Secretaries, both of whom responded to it. After Mr. George Paul had proposed the health of the Chairman, who briefly replied, the party separated.

THE "KNOWSLEY" SNOW PLOUGH.

As the time of the year is at hand when snow ploughs may be in request, I am sending a photograph of one which we have found to be a great improvement upon the rude implement in ordinary use. The "Knowsley" snow plough is, as will be seen by the illustration (fig. 78), an adjustable machine, and can be readily fixed to suit various widths of road, up to about 12 feet. There is a slightly projecting plate of iron fixed to the bottom edge of each side piece, which act as "shares" in cutting the snow loose from the ground, and a pair of iron "skates" fixed in the line of draught, and secured to the shafts and front part prevent the possibility of the implement refusing to act when it happens to get into a deep drift. As a further aid to that end the

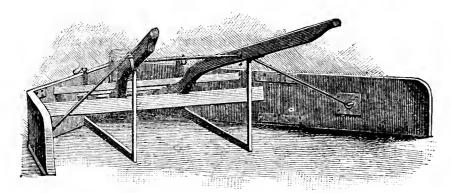

FIG. 78.—THE "KNOWSLEY" SNOW PLOUGH.

power is applied, that is the horse is hooked on, not at the extreme end as is usually done, but a little further back. The draught of the new implement is much lighter than that of the old pattern. The plough is shown here with one side extended and the other drawn in .- F. HARRISON.

OSIERS.

(Continued from page 273.)

HITHERTO the ordinary practice of most growers has been to sell the rods when cut to persons who peel, sort, and store them. The peeler requires a considerable supply of labour at a particular period, buildings in which to store the rods, and capital to enable him to hold the stock until it is wanted.

The cost of peeling is as follows. Women are paid 5d. per green hunch. The rods are brought to them by men, who sort, dry, tie, and store the bunches. Two men will attend to ten or twelve peelers, and they are paid 2d. per green bunch. A woman will peel from three to three and a half bunches in a day. The peeling process extends over eight to ten weeks.

The per-centage and weight of each class of rods produced in a holt has been estimated as follows :-

Large rods, 35 per cent., 56 lbs. per bunch.

Middle, 40 , 40-45 lbs. per bunch. Small, 28 lbs. per bunch. 25

Average weight per bunch about $43\frac{1}{4}$ lbs.

It takes three bunches of green rods to produce two bunches of peeled rods, and the ratio of white rods to green rods will be, approxi-

mately, $54\frac{1}{2}$ per cent. in weight.

A large proportion of the Osiers grown are sold by the growers in a green state. In the Cambridge district it has become usual to sell by auction at so much per acre, the purchaser cutting the crop and carrying it away. Basket-makers frequently contract with growers to take their green rods at a fixed price for a series of five, seven, or even fourteen years. The most common plan is for the grower to cut and sell green on the spot at the market price of the day. This price has of late years ranged from 1s. 6d. to 2s. 6d. per bunch, and at the present time the price is 2s. for good rods. Some of the larger growers peel and store the rods, and sell them when there is a brisk demand. Some, and an increasing number, combine the business of growing with that of manufacturing.

White rods are now generally sold by the ton, and the present price is about £18.

It will be interesting to compare the relative returns to the grower who sells the raw material and to the intermediary who prepares that material for the manufacturer. Taking the figures and prices given previously as a basis, it would appear that a grower who sells his rods green would receive for an average crop at present prices £15 an acre. A grower who peels his rods would receive for the same crop at present prices £34 19s. 1d.

The details of the calculation are as follows: - Average crop 150 bunches.

A. GROWER WHO SELLS GREEN.

150 green bunches at 2s. £15 0 0

B. GROWER WHO PEELS.

150 green bunches yield 100 bunches of white rods, average weight per bunch $43\frac{1}{2}$ lbs. = 1.942 tons at £18 per ton ... 34 19 1

> ... £19 19 1 Difference in gross returns ...

The cost of peeling, sorting, and storing has been stated as 7d. pe green bunch.

150 bunches at 7d. ... Add for carriage from holt to peeling yard 0 12 6 ld. per bunch Cost of peeling, &c. ... £5

This leaves £14 19s. 1d. to pay the middleman for his outlay of capital and risks of trade. It would seem, then that at current prices the value of the crop is divided pretty equally between the grower and the middleman, and that, as usual, the producer of the raw material gets very little in proportion to his original outlay unless he prepares his crop for the artificer.

Of course, in the fluctuation of prices the circumstances are sometimes less favourable to the man who does the intermediary work of dressing the raw material.

If the price of green bunches is 2s. 6d. when the price of rods is no more than £18, the margin between gross receipts of the two is reduced by £3 15s., and if the minimum prices of green rods and white rods be taken the case is very much altered.

150 green bunches at 1s. 6d. 1.942 tons of white rods at £10 per ton £19 8 4 Expenses of peeling and carriage ... 5 0 0 Difference...

It may, perhaps, be taken for granted that on the average the dresser or finisher has a good margin between the current price of the raw material and that of the prepared goods, and that an Osier grower who has conveniently situated and suitable premises, where a sufficient supply of labour can be found, has a great advantage over one who has no choice but to sell his rods as he cuts them, because he can get the middleman's profit.

Among other causes of the alleged decline in the osier industry, it has been said that cane is now largely used in the place of wicker-work Boxes have taken the place of hampers for the transport of fish. Barrels are much used for Potatoes, and iron scuttles and sieves are more common than they were.

There is also said to be some difficulty in obtaining an adequate supply of labour at the particular period when the peeling must be done. If that process is not completed before midsummer the quality of the rods is seriously deteriorated.

A grower states it as his own deliberate opinion that "a holt planted in a suitable site, well planted, cleaned, and cared for, filled up and replanted when necessary, has always paid its way, and where the circumstances allow of peeling the rods a very good result has been obtained.

(To be continued.)

HARDY FRUIT GARDEN.

Winter Pruning.—It is desirable to begin and complete this operation during the present month, as it is better to relieve trees and bushes of superfluous wood as soon as possible after the fall of the leaves. Though trees apparently are at rest there is yet a certain amount of activity prevailing which is seen in the gradual plumping and swelling of the buds, this process continuing all the winter. If pruning is deferred until early spring the buds intended to remain are deprived of much support they might otherwise receive when they have not to share it with useless growths. Mild, dry weather is the best time for pruning operations, hard frosty weather the worst. Much may be done on a slight frosty day, the ground being clean to walk upon, and the work not unpleasant.

Pyramid and Bush Trees.—Trained trees, well established, with the branches sufficiently wide apart to admit sun and light to each throughout the entire length, will need only the side shoots pruning to three buds, leaving the leading growths about a foot in length, or less if extension is not desired. Trees in the course of formation, having well ripened leading growths not too long, need not have these shortened severely, the removal of the points, which are invariably blossom buds and would prevent extension, being usually sufficient. Long immature shoots must be shortened back to firm wood, cutting near to a bud pointing in the right direction, making a short, sloping cut, which leaves no snags to die back. Remove dead spurs or wood, and of the spurs remaining any which are unduly elongated shorten back, also thin out crowded clumps. The access of light and air to the interior of the trees will then strengthen weak fruit buds.

Standard Trees.—The mistaken practice of shortening the branches of fully formed trees to any extent results in filling the interior and the upper branches with useless shoots. Properly managed standard trees require little pruning. Rank, gross growths when they appear may be cut out entirely. Branches extending beyond the bounds which mark a shapely, well balanced tree are better shortened to where other branches originate, this preventing the production of strong young growth likely to crowd the trees and make them unfruitful. Remove branches crossing one another, as well as those thickly and ill-placed. The advantages of having the branches thinly disposed, not only in winter, but in the summer, so that every part can receive the full benefit of abundant air and light, will quickly be apparent in early and continued fruitfulness, thus reducing severe pruning to a minimum.

Cordon Trees.—Upright, diagonal, and horizontal cordon-trained trees are easily managed, if the proper attention is accorded in the summer in stopping the side shoots, and, when the full extent of space is not covered, allowing the leaders to extend. Young trees well managed in these respects will soon be furnished from the base upwards with fruit buds. The pruning necessary at this season consists in reducing to two or three buds the summer-pruned shoots, slightly reducing elongated spurs, and thinning out where much crowded any clusters of spurs on aged cordons. As a rule immediately fruit bearing commences on young cordons over-vigorous growth of side shoots and leaders will be subdued, but should strong shoots assert themselves unduly, which cannot be restricted by summer pruning, lifting the trees when the leaves fall will restore the balance.

Fan-shaped Trees.—This form of training fruit trees is one of the best, because of the readiness with which branches can be replaced. It admits also of the combination method in the case of stone fruit trees by which fruit is produced on spurs as well as on young wood of one or two years' growth. Morello Cherries, Peaches, Nectarines, and Apricots produce fruit freely and best on healthy shoots of medium strength developed the previous season, but they will also bear on spurs. Plums and dessert Cherries on walls should have the branches well furnished with spurs by summer pinching, and the intervening spaces occupied with young wood thinly disposed, which will bear the second year. The chief pruning, therefore, consists of cutting out the old bearing wood and training in succession shoots, stopping those not well placed in summer to form spurs. Plums and Cherries may be pruned now, Peaches, Nectarines, and Apricots in February.

Bush Fruit.—Birds begin their depredations among Gooseberry and Currant bushes earlier than many people suspect, therefore it is not well to prune Gooseberry trees severely, but merely to thin out crowded shoots and branches, leaving a good proportion of young wood for future bearing. This may be done now or in spring, but whether the bushes are pruned or left alone they should be well dusted with soot or lime, applying either when the trees are wet with dew, fog, or rain. The buds are thus rendered distasteful to the birds, who in a great measure leave them alone so long as the bitter deposit adheres to the shoots.

If Red and White Currants have a great proportion of the buds picked out on the spurred-in shoots the following crop of fruit will be light. Cotton or worsted run in lines over the trees will prevent birds taking the buds, but the best protection is to grow the trees under wire netting, forming a fruit cage from which birds can be excluded during

winter, and when the fruit is ripe. At other times they should have free access to the trees, or insects may become rampant. Shorten the leading shoots of Currants to 8 or 9 inches, the side growths to an inch. Black Currants may have the old worn out shoots cut away, maintaining a good selection of vigorous young growths from the base which bear the finest fruit. No spurring-in of side shoots or shortening the leaders except where extending beyond bounds is necessary.

FRUIT FORCING.

Vines.—Earliest House.—After the buds break the temperature will need to be increased to 60° at night in mild weather, and 55° in severe, gradually increasing it so as to have it at 60° at night when the Vines are in leaf, and 70° to 75° by day with moderate ventilation. If there are evaporation troughs in the house, keep them regularly charged with liquid manure. Where these do not exist, and there is no fermenting bed, guano water, 1 lb. to 20 gallons of water, or the urinary drainings of stables and cowhouses, diluted with six times the bulk of water, may be sprinkled on the floor and surfaces of borders in the late afternoon, two or three times a week. Vines in pots will require more nourishment as the growth advances, supplying liquid manure at the temperature of the house. Sprinkle the house two or three times a day in clear weather, avoiding a very close and too damp or a dry atmosphere. Tie up the Vines in position as soon as growth has commenced in the lowest buds, always before the shoots are so long as to be damaged by the process. Disbudding should not be practised until the fruit shows in the points of the shoots.

Houses to have Fruit Ripe in May .- The Vines for this purpose must be started without delay, for quite five months are necessary to secure fruit of the early varieties during the winter and spring months. To facilitate a good break, and to save fuel, a bed of stable litter and leaves in equal parts, placed on the floor of the house, turning a portion of it daily, so as to supply ammonia, is useful. The outside border must also have the needful protection from cold rains and snow. If the roots of the Vines are mainly inside, a covering of leaves about 6 inches thick, and a little litter over them to prevent their being blown about by wind, will afford the needful protection. Where the roots are chiefly outside a covering of warm litter after the Vines break will materially assist root action and the supply of nourishment; two-thirds leaves to one third of stable litter affording a less violent heat, but more lasting than all manure. This material once put on must be kept at a regular heat by adding fresh as necessary and removing some of the spent. The inside borders should be made thoroughly moist, but not soddened, by applying water, or in the case of weakly Vines, liquid manure at the mean temperature of the house—preferably 5° in advance of it. It suffices if the soil is moderately moist until the Vines break. Start with a temperature of 50° in severe weather, 55° in mild weather, and 65° by day, except the weather is severe and dull, when 55° will be more Maintain a moist atmosphere by syringing the Vines and suitable. house occasionally, but avoid excessive moisture and keeping the rods dripping wet, for this excites the production of aërial roots from the rods. Depress young canes to the horizontal position or below to cause the buds to break regularly.

Midseason Houses.—The Vines will, in most cases, be pruned and at rest. If not, the pruning and cleansing of the house and Vines should be attended to without delay, for late pruning favours bleeding and insect pests immensely. Where the Grapes are partially cut the remainder may be removed with a good portion of wood attached, and that inserted in bottles of water, with a piece of charcoal in each, will keep the Grapes admirably in a dry room from which frost is excluded. This will liberate the Vines for pruning (it being assumed that the leaves are all down) and the house for cleaning, repairs and painting. The Vines ought only to have the loose bark removed, be washed with soapy tepid water, and afterwards with an insecticide. If they have been infested with scale or mealy bug add a fluid ounce of petroleum to a gallon of water in which 4 ozs. of softsoap has been dissolved, and churn violently with a syringe until the oil is well mixed with the solution, which is best effected at a temperature as high as the hand can bear, and then applied in a tepid state to the Vines with a stiffish brush, reaching well into every angle, crevice, and hole. Remove the surface soil without disturbing the roots, and supply a top-dressing of fresh loam about a couple of inches thick, and sprinkle over it a good handful of bonemeal and a similar amount of wood ashes (from twigs) per square yard. Both will be diffused through the soil, and be in a condition for taking up with the roots by the time the Vines start into growth, when they can be fed with quick acting manures.

Late Houses.—When the foliage is all down fire heat will only be necessary to exclude frost in dry weather, taking care to admit air before the sun acts on the house so as to cause moisture to be condensed on the berries, for in that case the skin of the Grapes will become discoloured and rapidly decay. A temperature of 50° by artificial means dries the atmosphere too much to preserve thin-skinned Grapes, such as Black Hamburghs, in sound condition—that is, without shrivelling. Muscats, Lady Downe's and Gros Colman require a temperature of 50° until thoroughly matured, and then a dry and equable temperature of 40° to 50° will insure their sound keeping, but a close, damp atmosphere causes the berries of Gros Colman to split and those of Muscat of Alexandria to spot, and the end of their keeping is then begun.

Figs.—Potted Trees.—For the early supply of Figs experience has proved the advantage of the pot over the planted out system. Trees in pots forced early for a number of years become more fruitful as they advance in age, and they commence growth as the usual time of starting

comes round in a lower temperature than trees that have not been subjected to the process. Being grown gradually they retain their first crop fruits much better than trees forced for the first time, unless these have been started early in the previous season, so as to make and complete their growth early, and have time for rest before starting. One great mistake in the culture of Figs in pots consists in retaining more trees than can have full exposure to light, for instead of reducing the number of trees by removing the least appreciated varieties or duplicates, the whole of the trees first procured are attempted to be grown in small pots and by reducing the heads. This is not the way to secure plants of fine Figs, for the extension system of pruning is not applicable to potted trees, and those that are early forced must not be crowded. For early forcing Early Violet and St. John's are excellent small fruited varieties, White Marseilles and Brown Turkey Figs being far the best for general supply, and afford an excellent succession. Trees in pots do remarkably well when afforded bottom heat, the pots being stood on loose brick pedestals, the roots allowed to extend outside the pots, and renewed annually. This with copious supplies of liquid manure, and judicious thinning of the second crop fruits, results in a satisfactory crop of early Figs, the most important in forcing.

Planted-out Trees.—These are much more luxuriant and have longerjointed wood than trees in pots. They are often unfruitful when grown
in a deep and rich soil. To have fruitful trees the border must be
firm, narrow, shallow, and well drained, then the growth will be sturdy,
the foliage thick, the wood stout, short-jointed, hard, and well-ripened.
The border must be composed of well-compacted rather strong loam,
containing plentiful supplies of calcareous and siliceous matter. A
width of 3 feet is ample to begin with, and 6 feet for the largest tree,
and a foot depth of drainage must be provided, having a drain under
(unless the substratum be gravel or other natural drainage) to carry off
superfluous water, placing a 3-inch layer of lime rubbish over it. The
soil may consist of medium textured loam, inclined to be stiff rather
than light, and if not calcareous add a sixth of gravelly marl, a fifth of
old mortar rubbish and a fourth of road scrapings, well incorporated.
If the loam is inclined to clay, omit the marl and add more road
scrapings, if light omit the road scrapings and increase the marl. Put
together firmly when moderately dry, allowing a few inches for
settling.

Trees with single stems are the only suitable ones. They will be in pots. Remove and wash away all the soil; then disentangle the roots, spread them out evenly, covering about 3 inches with fine soil, and give a good watering. When the surface has become dry, tread firmly, and mulch with a little short manure. Fan training is the most suitable. The house must be light, face south for preference (imperatively so for early forcing), and have top and bottom ventilation. The shoots should be trained about 1 foot from the glass. For a lean-to it is better to plant the trees at the back and train the growths down than plant in front and take them up the roof. This insures the light direct into the points of the shoots, and the fruit is borne freely throughout the length of the terminals, which produces much finer specimens than stunted pinched growths.

For general forcing purposes no Fig surpasses Brown Turkey, and it has an eligible companion in White Marseilles. Negro Largo is very fine, especially for succession and iate crops, but it must be confined at the roots. For high quality Black Bourjassotte, Gourand Noir, Monaco Bianca, and Grizzly Bourjassotte are unrivalled as midseason varieties, while for late use Col di Signora Bianca and Agen are excellent. To ripen these well they require fire heat.

APIARIAN NOTES.

THE LANARKSHIRE STORIFYING HIVE.

"A Sussex Amateur" is desirous of having full information how to construct the Lanarkshire storifying hive. At an early date descriptive notes with drawings will be published, which will enable any amateur to make them, or to materially assist his tradesman. Meanwhile it is to be hoped no one will allow himself to be carried away with the idea that a hive of some peculiar construction should first be procured, and then large yields of honey will follow without further exertion. The fact is, as I have repeatedly shown, as much honey can be had from a common box or straw hive, as from the most elaborate frame one. Give them proper attention with ample accommodation, and the bees of the abused straw hive will yield to their owner as much weight or more of a superior quality of honey than any frame hive of the modern bee-keeper, with the use and the abuse of combs and extractor. Turning unsealed combs containing brood, food, and water for larvæ into it does not produce that excellence in honey we were accustomed to in our youth from the selected combs of the straw hive. The sealings of the comb were cut and honey allowed to drip through a clean wicker basket and muslin cloth.

The advantages of frame hives are to be sought for in different directions than large yields of honey. But in the proper management of superior frame hives the facilities are greater to increase the yield if given proper attention; if neglected, then the large straw hive is superior. The winter problem is thoroughly solved in the Lanarkshire hive. The bees are all preserved alive in it during the winter; breeding goes on uninterrupted and in a healthy state from the end of December. The bees are always strong, and ready to gather honey and pollen from any source at the earliest opportunities. Bees that have been badly wintered in unhealthy hives require weeks to make up what they lose in the winter through dampness and other evils.

A properly constructed hive enables the bee-keeper to add or diminish its size at will, and to compel the bees to store the choicest honey where he chooses. He may also delay or prevent swarming according to circumstances, and to be able in a few minutes to move them from one place to another, with perfect safety to the bees and to those attending them. It is possible, too, to pack them when in transit in little space without any damage resulting to the hives. The foregoing are only a few of the properties the Lanarkshire storifying hive possess, which gives the bee-keeper a slight idea of what a hive should be like and what it should possess.—

A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Communications for Our "Next Issue" (J. K.).—You are only one of several correspondents who prevent their communications appearing in the desired "next issue" by posting them too late for that purpose. Only brief and urgent letters arriving on Wednesday morning can be inserted the same week.

Chrysanthemum Waban (E. Molyneux).—The bloom is very imposing, being just 30 inches in circumference. Evidently you do not intend Chrysanthemum growing to become a lost art at Swanmore, though you have "given up showing."

Black Paint for Hot-water Pipes (T. R. P.).—Lampblack formed into a thin paint with boiled linseed oil is the best. If the pipes are made warm before, and kept so whilst the paint is being applied, it will dry sooner, and air being admitted the smell will not prove injurious to plants. Only one even coat need be given.

Sawdust from Stables as a Mulch for Fruit Trees (F. J.).—Sawdust, after being used for bedding horses, is a good mulch for fruit trees, as it is rich in ammonia-forming matter. The only danger attending its use is that of favouring fungi, which may prove injurious to the roots of the fruit trees, but we have used it without any deleterious consequences following. It may also be used for Strawberries.

Vine Affected with Mildew (F. J.).—After washing the Black Hamburgh Vine with softsoap and water, and thoroughly cleansing the house, the rod and spurs may be dressed with sulphide of potassium, 1 cz. to a gallon of water, applying with a brush, and reaching well into every angle and crevice, but taking care not to injure the buds. Limewash the walls, adding a good handful of flowers of sulphur to a pailful of limewash. Remove the loose surface soil from the border, and supply fresh loam. If the mildew appear next season dust with flowers of sulphur.

Specks on Apple (Effingham).—The specks are produced by a fungus called Glæosporium fructigenum. It is rather common this year on the gritty Pears and hard-fleshed Apples, attacking them later in the season than usual, but it develops rapidly in the stores. Sulphide of potassium, half an ounce to a gallon of water, used as a spray or through a fine-rose syringe when the fruit is about a quarter grown, again when half grown, and a third time when about three parts grown, is recommended as a preventive. The fruit should be disposed of, or preferably destroyed. If the Apples are used the peelings ought to be burned.

Greenish-white Chrysanthemum (R. P.). — Mr. Molyneux says the only variety he knows resembling Florence Davis (Japanese) in colour is Lord Eversley, a sport from Princess Teck, originating in the hands of the late Mr. Wildsmith, at Heckfield, in 1887. In formation it is, like nearly all sports, the exact counterpart of its parent. It, however, produces the smallest blooms of all the "Teck" family. For late flowering it is valuable, and for exhibition, too, where a large number of varieties is required. Like Florence Davis, the florets are tinted green when unfolding, but as in the case of that Japanese variety the blooms are pure white when fully developed. In the case of Lord Eversley, though, it is the tips of the florets that are green, in the other referred to it is the centre of the flower.

Microscope for Examining Bacteria (L. D.).—To show the bioplasm or living matter growing and multiplying in the bundles of fibrous tissue in animals, or in the cells of plants, a power of 700 diameters is necessary; while to differentiate or show the very minute particles of the contagious living matter or bioplasm a lens magnifying 1800 diameters is required; but to distinguish the malignant from the useful bacteria, and refer each to its specific character, a power of 5000 diameters is absolutely essential. This implies a knowledge of bacteriology, attainable only by a long course of study and acquirement of the distinction between fungal and bacterial ferments, which in many cases, especially in plants, is only determinable by cultures.

Sunday Work in Gardens (A. E. C.). — Our correspondent could not have been aware of what you state, and, we hope, exaggerate. We cannot understand that any gentleman countenancing such Sunday work in his garden as "hoeing between Beet, hacking Potatoes, 'wartering' Lettuce plants" (you should learn to spell 'watering') "syringing Peas, Cherry trees, and doing such like work." We are of opinion that all unnecessary labour should be avoided in gardens on Sundays. Your letter is so faulty in grammar that it cannot be inserted. You say our correspondent does the work indicated, though you no doubt intended your allegation to apply to the gardener whose work he described.

Liquid Manure in Winter for Vines (W. Law).—As you say the border is poor, and you could not obtain sewage until now, by all means use it at once provided the site is naturally or artificially drained so that superfluous water passes away freely. Some of the most profitable Vines we know, and which have afforded splendid Grapes that have won leading honours at the best shows this year, are made so in part (and the grower believes it a considerable part) by applications of liquid manure on favourable occasions during the winter. It can be used with advantage much stronger, during what is known as the resting than the growing period of Vines and fruit trees. Do not miss the opportunity of applying it to anything that needs manurial support.

House for Fruit and Chrysanthemums (W. H. M.).-1, The house will answer as regards aspect, but it is somewhat narrow, for with a path up the centre there will be a 4 feet 6 inches border on each side. This is quite wide enough for the trees with liberal feeding. You may have a tree on each side. Dymond and Royal George are excellent Peaches, planting the first on the south-east, and the latter on the north-west aspect. 2, Pears are not suitable on account of the heat in winter. 3, A flow and return 4-inch hot-water pipe along both sides would be sufficient, the pipe not needing to be highly heated. 4, The pipes may be fixed about 6 inches from the wall. 5, A 3-feet wide border would answer for cordon or "U" trained trees, and it would then be a better arrangement as regards the Chrysanthemums, as they would then have the centre of the house.

Mineral Constituents of Pears, Plums, and Strawberries (Diss.).—The differences between the per-centages of ash and mineral (Diss.).—The differences between the per-centages of ash and mineral matter have no connection whatever with each other, as they referentirely to different subjects. To give a detailed analysis of Apples would enhance the value and add to the expense tenfold, which no analytical chemist, as a rule, gives, for the simple reason that few care to pay for so elaborate an analysis of fruit. Pear: Potash, 54.69; soda, 8.52; magnesia, 5.22; lime, 7.98; phosphoric acid, 14.28; sulphuric acid, 5.69; silica, 1.49; iron, 1.96; chloride of sodium, trace. Plum: Potash, 59.21; soda, 0.54; magnesia, 5.46; lime, 10.04; phosphoric acid, 12.26; sulphuric acid, 3.83; silica, 2.36; iron, 6.04; chloride of sodium, trace. Strawberries: Potash, 21.07; soda, 27.01; magnesia, trace: lime, 14.21; phosphoric acid, 8.59; sulphuric acid. magnesia, trace; lime, 14 21; phosphoric acid, 8:59; sulphuric acid, 3:15; silica, 12:03; iron, 11:12; chloride of sodium, 2:78. The percentages of potash and sodium vary in fruit from different soils as they are interchangeable by the Strawberry. The albuminoids in Pears are 0.3; mineral matter, 0.3. In Plums: Albuminoids, 0.5; mineral matter, 0.4. In Strawberries: Albuminoids, 0.3; mineral matter, 0.2.

Vines for a House without Fire Heat (G. B.).—The variety you name is not desirable for the purpose indicated. Chasselas Vibert, Early Smyrna Frontignan, and Foster's Seedling (white Grapes), also Black Hamburgh, Black Prince, and Madresfield Court (black Grapes) succeed in unheated houses farther north than the Midlan's in favourable localities and seasons, under judicious management. This mainly consists in husbanding the sun's heat after the Vines start into growth, allowing them to do this naturally—that is, not coddling them in the spring, but ventilating fully, so as to prevent growth before April, then pushing them ahead by judicious early closing, especially after the Grapes are set and until they are well ripened. At the same time we

consider that structures for growing Grapes in are incomplete if provision is not made for affording artificial heat.

Names of Fruits.—Notice.—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (T. J., Watford.).—We think the Apple is Warner's King. (H. D.).—The most careful dissection does not reveal the name of the Apple, and it may be a local seedling. (W. G.).—Wyken Pippin undoubtedly.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (F. H.).—Anthurium Andreanum. (Young Gardener).—1, Agave americana; 2, Yucca filamentosa; 3, Kentia Canterburyana; 4, Seaforthia elegans. (Amateur).—Jasminum nudiflorum. (H. P.).— Impatiens Hawkeri.

PROFITABLE LIVE STOCK.

LESSON OF THE CATTLE SHOW.

FOR an easy, enjoyable, and instructive comparison of breeds in full development, or far on the way thither, the winter show of fat stock at Islington is altogether preferable to the summer meeting of the "Royal," simply because at the Agricultural Hall the classes are so near each other and are so accessible that comparison is easy, and a useful critical inspection really possible.

Among the cattle the chief points of interest are early development, symmetrical forms, and large size. Taking the dictum for our guide of Sir John B. Lawes, that as a certain amount of food is consumed every day by an animal for respiratory and other vital functions, it is evident that the quicker an animal is fed for the butcher the less total amount of food he will consume, weight, age, and general appearance all have attention. Among the Shorthorns in class 11 for steers not exceeding two years old, the Queen's first prize handsome steer, weighing 14 cwt. 9 lbs., and one year eleven months three weeks old, was a marvellous example of early development. The weekly average weight from birth to show entry being about 151 lbs., bears favourable comparison with that of another of Her Majesty's prizewinners, Prince Charlie, weighing 201 cwt. at the age of three years six months two weeks, or a weekly average of about $12\frac{1}{2}$ lbs. This grand beast was so symmetrical that it not only took first prize in the class for Shorthorn steers above three and not exceeding four years, beating Mr. J. W. Rowland's huge second prize steer, weighing 22 cwt. 2 qrs. 18 lbs., and Lord Tredegar's third prize beast, weighing 20 cwt. 3 qrs. 21 lbs., but it was awarded the breed cup, the £50 cup as best male among the cattle, and the reserve ticket for the championship. A marvellous sight were these three magnificent animals, each of them over a ton live weight, but apart from prizewinning, and regarded strictly from a commercial point of view, the younger steer bears away the palm from all of them.

That the judges were not influenced by mere weight was also evident in the contest for the championship between Prince Charlie and Mr. J. D. Fletcher's polled Aberdeen, Angus heifer, Pride of the Highlands, two years and eleven months old, and weighing 17 cwt. 2 qrs. So excellent were both of them that it was only after the most deliberate inspection and discussion of every point that the judges decided in favour of Pride of the Highlands, which was also first in its class, and winner of the breed cup.

Excellent examples of early maturity were there in other breeds, as, for example, Mr. T. H. Risdon's first prize Devon steer, one year eleven months two weeks old, weighing 11 cwt.; Lord Coventry's first prize Hereford steer, one year seven months old, weighing 11 cwt. 25 lbs.; Mr. J. Godman's first prize Sussex steer, one year ten months three weeks old, weighing 12 cwt. 26 lbs.; Mr. R. Turner's first prize polled Aberdeen-Angus steer, one year ten months old, weighing 11 cwt. 2 qrs. 2 lbs.; and a cross-bred steer, for which Mr. John Ross had first prize, a very compact polled beast, black and white in colour, with Aberdeen-Angus blood largely predominant, one year eight months one week old, weighing 12 cwt. 1 qr. 12 lbs. All of them were in the classes of their respective breeds for steers not exceeding two years. Though the crossbred steer has some advantage over the pure-bred animals in weight, we were not favourably impressed by the appearance of it or any other cross-bred cattle in the Show. They had an inferior appearance that suffered very much by comparison with the pure breeds.

For condition, form, and finish there was nothing to equal the attractive and picturesque Herefords. Their white faces, red coats, evident ripeness, and symmetry showed how entirely they were worthy of the high rank assigned them among our best cattle, and how well they repay for careful tending and judicious feeding. We were probably more impressed by them because we had seen many of the same breed out of conditionvictims of the drought-at Guildford Market on the previous day. One of the most handsome beasts in the Show was Mr. John Wortley's first prize Hereford, in the class for steers not exceeding three years old. It was two years seven months old, and weighed 16 cwt. 26 lbs., gaining also the breed cup. Our note of it was "a fine compact beast—a picture!" Very handsome, too, was the Queen's first prize Hereford heifer, weighing 12 cwt, at the age of two years seven months. Mr. R. Edwards' second prize heifer, a month younger than Her Majesty's, weighed nearly 2 cwt. more, and was, we thought, the finer animal of the two; and the heaviest Shorthorns had no mean rival in Mr. F. Platt's Hereford steer, weighing 20 cwt. 2 qrs. 24 lbs. at the age of three years ten months.

WORK ON THE HOME FARM.

Recent inquiries about eggs in winter show how little progress is made in a matter wherein success depends upon details of management, and not upon exterior influences. Where the supply has fallen off for want of pullets coming in to lay now, nothing can be done till next season, unless, indeed, more pullets were purchased at once, which would prove to be an expensive affair. But if there is a cessation of laying by the April or May hens of the current year, it is probably owing to the use of improper food and a want of shelter for the poultry both by day and night. Remember that fowls go to roost early now, often by or before 3 P.M. At least, on alternate days, preferably daily, they should have some warm food about 2.30, consisting either of oat meal or barleymeal, or both in mixture. In Sussex it would probably be oatmeal, in the eastern counties barleymeal; which of them has preference is immaterial, the point of real importance is that they have the food warm. Some very successful poultry keepers prefer whole corn. We do not object, only the meal can be prepared simply by mixing it with hot water, while the whole corn require a saucepan in which it is placed, almost covered with cold water, which is then made to just boil, then withdrawn slightly from the fire for an hour so as to keep hot, and cause the corn to swell without any more boiling.

When they come down in the morning they have a warm breakfast, and then run into a long shed open to the south, having plenty of dust on the earthen floor. Here they have some corn, Wheat, Maize, or Barley thrown among the dust to busy them, but this is only in calm weather. On very rough cold days they are kept in the snug poultry house, which is quite clean, has plenty of light, not a chink or hole of any sort, nor openings along the eaves to admit draughts; warm food is then given them at dawn of day at about clean, and accir food is then given them at dawn of day, at about eleven, and again about three hours before they go up to the perches.

We have now an excellent supply of rich-looking brown eggs from Wyandotte pullets, which are excellent. Minorcas and White Dorkings have also supplied us well with winter eggs, mainly because of shelter and warm nourishing foods.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

3rd.—Frequent bright sunshine in morning, and at times in afternoon; fair evening;

3rd.—Frequent bright sunshine in morning, and at times in alternoon; last evening, cloudy night.
4th.—Cloudy with occasional faint sunshine in morning; bright for about an hour at midday; dull and drizzly from 8 P.M. 5th.—Fair, but almost sunless.
6th.—Fair with occasional faint sunshine; drizzle and spots of rain in evening.
7th.—Showers early; bright sunshine from 9 A.M., and almost cloudless from 11 A.M.
8th.—Overcast early; frequent drizzle from 8.30 A.M.; rain from noon, and heavy rain at 2 P.M.; fair after 3 P.M.
9th.—Rain from 0.30 to 2.30 A.M., and at 5.30 A.M.; cleared after sunrise, and bright sun from 10 A.M.; almost cloudless night.
Barometer and wind variable, temperature slightly below the average.—G.J.SYMONS.

As the festive season of Christmas approaches, bringing with it feelings of universal gladness, long-parted friends and relations gather once more around the family board, or perchance lift up their voices in thankfulness and praise within the sacred walls of the church of childhood's days. On these befitting occasions it has long been the widespread custom to embellish the interior of our sacred edifices with evergreens, berries, and flowers. In so many instances the execution of the lion's share of this kind of work falls to the gardeners that it may without further explanation be classed among their multitudinous duties. Having had a considerable amount of experience at this work, I trust a few remarks on the subject may prove useful to many at the present time.

A prominent feature in church decorations, especially in those instances in which stately pillars or beautiful Gothic arches abound, is produced by tracing the outlines of the latter, and encircling the former, with wreaths made of evergreens of various descriptions. These, if well made, are always effective, even if many kinds of foliage are mixed up in an indiscriminate fashion; but in order to avoid sameness and produce distinct features, if the work is carried out on an extensive scale, certain portions of it should be done with one or two kinds of foliage only, and others with entirely different material. In this way special features are created, for the lack of which many examples of decorative work are greatly marred. I will here give a few illustrations of my meaning, which of course are not advanced as the only methods of securing the desired effect, but are given to show the plan of action by which monotony may be avoided.

The dark coloured oak of which choir stalls are frequently constructed may be effectively decorated by employing Variegated Holly or shoots of Aucuba japonica formed into wreaths and fastened around their outlines. Stone pillars, which are generally light in colour, look exceedingly well if encircled with wreaths made of sprays of Ivy surmounted with berries. Holly with green leaves and red berries, or a combination of Portugal Laurel and light sprays of Yew, are equally suitable for the purpose. The angles formed by the outer walls and ceiling require as a rule the heaviest wreaths. These may, therefore, have a great variety of materials employed in their construction. Laurel, Yew, Box and Holly answer the purpose admirably. Whenever there is a considerable amount of bare wall below the base of the roof, wreath festoons should be arranged from it at intervals of from 3 to 6 feet. The wreaths to fit in the angles ought to be made flat; those for festooning round, and be so arranged that they are fullest in the centre, gradually tapering to the point where they are fastened to the wreath above. Arches which have a series of grooves cut in the stone of which they are made, generally require a rather heavy wreath fitted round the outer groove, and a much smaller and round one made of Box, arranged in the groove nearest the under side of the arch.

A most finished way of decorating large arches is to treat them as already described, and in addition procure stout iron rods, have them bent to the shape of the arch, and by means of iron clips at the base and apex fasten them in position so as to join the framework of another arch 1 foot below the arch proper. Before placing finally in position, these irons should be covered with Holly or other stiff evergreen, and when fitted up have baskets of Ferns

suspended from the apex and base. The effect is then exceedingly good. Those who have not yet tried this plan, I would strongly advise to do so.

In making wreaths of all kinds the thickness of string should be regulated by the diameter of the wreath to be made, and in all instances I prefer wire for binding the shoots to the string. The kind of wire obtained on reels is scarcely thick enough for the purpose, but I have no difficulty in obtaining rolls of iron or brass wire of exactly the right thickness. It is wound on reels as required, being much handier for use in that form. Bunches of Helichrysums of various colours are extremely useful for fastening at intervals along wreaths in the most conspicuous positions.

One of the most tedious branches of the work of church decoration is that of arranging letters in the form of texts on substances of various descriptions and shapes. A framework of board with scarlet cloth stretched across it is a favourite and effective method of forming the groundwork, and letters cut out of stiff white paper look well upon such a groundwork. I used to find it a rather difficult matter to cut out the letters in good form; that difficulty has, however, been overcome by getting the printers to stamp the required letters on paper with their largest type, it is then an easy matter to cut them out correctly. Perhaps the most effective white letters are those formed of cotton wool which has been split asunder, so as to leave a rough side to the front. When these are used I cut out the letters in paper, and then mark the wool under them. Letters may also be formed of gilt paper, as well as paper of other colours, Holly berries, Holly leaves, or leaves of many kinds, gum, cotton, or tacks being the material employed for securing them to the groundwork. Holly leaves or small twigs of Yew are generally employed to form a border round devices on which texts have been fastened. Rough wooden frameworks formed of laths crossing each other in such a way as to form a series of diamonds, if covered with Laurel leaves, which may easily be fastened with tin tacks, provide an easy method of covering bare spaces of wall, or for making temporary screens of an ornamental character. Holly berries or bunches of Immortelles should be fastened at the points where the laths cross each other.

The pulpit and lectern require especial attention in the matter of decoration. To do this effectively whatever materials are employed for the purpose should be so arranged as to trace the outline of panels and beading. Strips of brown paper or canvas are the most generally useful for fastening the materials to. I have sometimes secured an excellent effect by covering such strips with Holly or Laurel leaves, and then dotting them at intervals alternately with small circles of red berries and tufts of grey lichen (obtained from old Apple trees), the centre of the panels being covered with cotton wool, supporting interwoven letters worked out in red Holly berries. The berries and lichen are easily fastened in position by the aid of rather thick gum.

Many fine examples of windows of various types may be met with in our ancient Churches. These when tastefully decorated add much to the general effect from an artistic point of view, yet strange to say, the embellishment of windows usually receives but scant attention, beyond encircling the surrounding rim of wall in a wreath of evergreens. When all of them cannot be well done, a few of the most prominent should receive special attention. The largest and most conspicuous is usually immediately above the Communion Table. This has generally a wide sloping ledge, upon which a most pleasing effect may be produced by the employment of cut flowers and pot plants. A shallow tin about 2 inches wide should be fitted along the front of the ledge, and a groundwork of Ferns in pots be arranged over the remaining space. This groundwork may be dotted thinly with graceful Palms, some plants of Poinsettia, or Scarlet Pelargoniums, and Roman Hyacinths; but few will be required even for the largest windows, as overcrowding is the great thing to avoid. This finished, the tins may be filled with water and arranged with flowers and greenery; scarlet is the most

suitable colour. Smaller windows may be quickly done by placing a Palm or Dracæna in the centre, covering the foot, and the remainder of the window-ledge with a mound of moss, dotting this with berried Holly, Immortelles, or flowers. In doing this work to the best of our ability something is contributed towards the happiness of others, which helps both worker and beholder to realise the hidden meaning of the time-honoured greeting—"A Happy Christmas!"

Much more might be written on this subject, but I have endeavoured to set the inventive faculties of Journal readers at work in such a way as to enable them to create novel and beautiful combinations for themselves.—Decorator.

THE FRUIT-KEEPING QUESTION.

FOR one reason do I again return to this question—namely, to point out to "A.D." (page 527) that he has not shown his usual perspicacity in looking at the arguments of those with whom he appears to differ, or exhibited that impartiality of judgment that generally characterises his writings. He has been so anxious to demolish his neighbour's theory that he has not made himself thoroughly conversant with it, or if so, he has not been generous enough to give his neighbour the benefit of that aquaintance. I leave the defence of the theory set up by your other correspondents and myself in better hands than mine if they care to go over the ground again, or to enlarge the question by other arguments.

It will be sufficient for me to call "A. D.'s" attention to this fact that I did not "jump to my conclusion as to the sap theory with a real rush," but that I arrived at it by slow and painful degrees; and for this reason, because it was those early Pears which swelled "after the rains came," and which, by their season, had to be gathered whether or not, that were the soonest decayed, and deficient in quality. Having, as he thinks, tripped me up about Pears, he attempts to do so as to Apples. I said Apples were keeping well, and so they are, the late ones, and for that very reason I said we gave them as long a time to mature as we could, in order that the rush of sap into the fruits might be converted from the crude watery elements of its first stage into the ripened juices of the perfect stage. Is there anything wrong in that?

Fruit gathered with sap in it which had not been elaborated would mean an early corruption of it, just as fruit gathered after the elements had by time chemically changed that crude sap into conservative juices would keep, unless fungus or other decaying agencies were at work. That is how I look at it. It is perhaps a very simple way of doing so, and not quite that of these fin de siècle days. Nevertheless, as a gardener of the older school, and one that has been a reader of the Journal of Horticulture for forty years this very year, I am not ashamed of it, because I gathered it first from my early teachers in the old Cottage Gardener, and have seen no reason in all that time to alter it by a long fruit experience. I think if "A. D." will read back he will see that his charge against me of hasty, illogical, and unpractical deductions of a theory is not a sound one, and if he will kindly re-read my notes, I think even he will agree that it is scarcely a generous one. As I said before, so say I again, "A. D." is usually so fair in his judgment that I am sure he will do me this justice.

As the blessed time of "Peace on earth" is here—sentimentally, if we do not make it practically so—I wish him, and all readers of the Journal of Horticulture, but especially our chief and his most efficient assistants, and the old writers (not many left now!) and the young writers (more power to them!), a very Merry Christmas and a Happy New Year, when it comes. We of the generation which looks back along the years we have been together, and miss the old names in the pages of our Journal, do so with a deepening sadness at the remembrance of the loss of their steadfast lives and practical teachings; but also with much satisfaction that their "prophet's mantle" has fallen on to most worthy shoulders of the present day; and so with calm cou age we settle down to doing the day's duty as best we can in our coming days, be they many or few.—N. H. P.

[We are sure that both old friends and new writers and readers will reciprocate the kindly sentiments so felicitously expressed, and hope that "N. H. P." has yet many happy new years to come]

My opinion for Apples not keeping well in some instances this year is the rain came just at the time they were maturing, and, therefore, unable to assimilate the superabundant moisture contracted by absorption from the humid atmosphere as well as through

the cellular tissue of the tree. Is there at y remedy to prevent the early decaying of Apples? or is it possible to build a fruit house that will be every year satisfactory? I am afiaid not. Potatoes, Turnips, and other roots sometimes decay to all appearance the same as Apples are doing. The cause, I believe, is some sort of ferment, which, owing to a certain amount of water being present, overcomes the antiseptic properties of sugar, converting it and the starch into carbonised matter much in the same way as sulphuric acid acts upon sugar.

Shrivelled Apples are frequently more delicious to the palate than plump ones, and are in a better state of preservation if the shrivelling be moderate. Had these juicy Apples been thoroughly desiccated there would not have been premature decay, and in the other extreme, plunged into water, they would in all likelihood remained fresh for a longer period. I have known Apples and Pears to keep well when damaged slightly by a small piece being

cut or chipped from them.

Fruit to keep well should have a certain proportion of water to the amount of sugar present, and when in excess ought to be evaporated by being kept in a warm fruit house. To know the right proportion of water experiments should be made to learn that, and the weight of sugar to the bulk of Apples ascertained.

—W. T.

AMERICAN APPLES.

BOTH Mr. Bunyard and Mr. Watkins (page 528) are somewhat down on American Apples, and they should be able now to estimate their true value. I grew Northein Spy for many years on stiff clay in a bed on the Crab stock, and never had a fruit; on the other hand, with Mr. Turton at Maiden Erlegh, on almost as stiff soil, but worked on the Paradise stock, and in bush form, it fruits freely, some of the fruits being exceptionally handsome, rich coloured, and good. Against that success we have to set the fact that it is a variety that displays far more of failures than successes. I had given me the other day, grown on the chalk at Titsey Park, Surrey, by Mr. J. Dean, a couple of much larger samples, and the fruits look as if they would keep firm till the end of January. Still the past season has been so exceptional, as all admit, that varieties that under ordinary conditions seldom fruit have borne good crops are fine samples.

At the Drill Hall last week Mr. J. Smith, of Mentmore Gardens, invited me, with others, to taste samples of the American Baldwin he had from trees grown at Mentmore. The samples were good, skin clear golden, not highly coloured, the flesh soft, and particularly sugary, but not specially flavoured. I wonder whether persons who praise this Apple so much sometimes mistake sugar for flavour. Whenever any doubt prevails as to whether a variety has flavour or not, it is wise to refresh the palate with a taste of Cox's Orange Pippin, and a standard of excellence is found that admits of no disputation. It will be interesting to learn how the Baldwin does at Mentmore in ordinary seasons. Practically we have little room in this country for American Apples, and less need for them. Our wealth of varieties literally covers all our needs. Any advance, if it be possible, should not be found in adding so much to our present plethora of early dessert and huge cooking sorts, of which we have legion, but rather in improving our late-keeping or winter varieties, for these afford most scope for development.—A. D.

HARDY FLOWER NOTES.

Snowdrops.

So long has the Snowdrop seemed to us the "early herald of the infant year" that to many the introduction of the varieties which bloom in late autumn and early winter appears somewhat unwelcome. Our ordinary Galanthus nivalis has always been eagerly looked for as the harbinger of spring, betokening the coming of the host of flowers which that season delights to display to our admiring eyes. Yet to those who grow the autumn and winter Snowdrops it is wonderful how soon they entwine themselves into our affections, and equally wonderful how eagerly they are watched for as they peer through the soil, and gradually attain their flowering period. It was with the keenest pleasure that I recently lingered before a few of these chaste flowers, when a partial recovery from a severe attack of influenza enabled me once more to venture into the garden to see what was left to us in these gloomy days.

GALANTHUS OCTOBRENSIS (?) FROM ALBANIA.

One of these autumn Snowdrops which will, in all probability, prove one of the hardiest of its race is one introduced from Albania by Mr. Van Tubergen of Haarlem. The flowers are not, perhaps, the largest, but the plant shows every sign of a good constitution; my few bulbs, which were planted in the summer of 1892, all showing offsets this season. The first flowers of this Snowdrop became fully expanded on October 22nd, and continued in beauty

for a long period. In my garden it has attained a height of only 4 inches, and the sepals or outer segments are rather less than 1 inch in length. In this species or variety, which an excellent authority on Snowdrops has recognised as only a variety of G. octobrensis, the sepals appear to be more deeply fluted than any of the others in flower here. The leaves, which are narrow, present the great characteristic of the autumn and winter Snowdrop—the glaucous line down the centre—which adds much to the appearance of the plant. The flower scape, which is cylindrical, is of a beautiful glaucous green.

GALANTHUS CORCYRENSIS PRÆCOX (?).

In a small consignment of G. corcyrensis which reached me through an Italian firm in 1892 was a fine Snowdrop, that flowered much earlier than the others of the same parcel last winter, and this year the same bulb produced a flower which was fully expanded on October 22nd, the same day as G. octobrensis flowered. As it is undistinguishable from the typical G. corcyrensis, except from its earlier period of blooming and its handsomer flower, I have named it provisionally G. corcyrensis præcox. It has broader leaves than the species already spoken of, and grows to the top of the spathe valves to between 5 and 6 inches in height, while the floral segments, which are of good form and substance, are considerably over 1 inch in length. Last year this bulb produced two flowers, and this season it will produce the same number, but is as yet showing no signs of any offsets.

GALANTHUS RACHELÆ.

I have to acknowledge, on the part of Mr. F. W. Burbidge, of Trinity College Gardens, Dublin, an act of great kindness in his sending me, quite unsolicited, a bulb of the true G. Rachelæ, and also one of the true G. Elsæ. I appreciate Mr. Burbidge's kindness all the more highly in consideration of my being a total stranger to him, and the stock of these two rare Snowdrops being so small. Up to the time I write, while G. Elsæ has made its appearance above the soil; G. Rachelæ has not yet shown, but I am in hope it is still in existence. In 1892 I, however, received from the same source as the G. corcyrensis præcox, mentioned above, a Snowdrop under the name of G. Rachelæ. Last year I was very sceptical as to its truth to name, knowing as I did that it could not have come from the small stock brought from Greece by Professor Mahaffy. This year, however, it flowered about October 29th, and I am more inclined to think that it may after all be from the same habitat as Professor Mahaffy's plant. In G. Rachelæ the flowers should appear before the foliage, and in the plant under notice the leaves are only noticeable when the flower appears. Whether correctly named or not, this Snowdrop is a very pretty one, of excellent form and colour, with sepals of 1 inch in length on a scape about 5 inches high, and with the pretty leaves just showing. Various other autumn Snowdrops have reached me this season, but they cannot be spoken of with any confidence at present.

CROCUS HYEMALIS VAR. FOXI.

In walking round my garden a welcome greeting seemed offered by a clump of this pretty Crocus, which had come into flower while I was confined to the house. I have mentioned it before, but the fact of its thorough hardiness being well proved, and the beauty of its white flowers with black anthers and gold wire-like stigmas, make it worthy of this further passing notice.

ANEMONE FULGENS.

This is at present in leaf here, and, attracting my attention, I was reminded that for some time I have intended writing a brief note upon this undeniably fine Anemone. For some time past complaints, which have been in accordance with my own difficulties, have reached me with regard to the non-flowering of A. fulgens after the first season from purchase. Generally speaking it proves satisfactory enough the first season, and the pleasure experienced at the sight of the brilliant scarlet flowers only intensifies the disappointment the following year. The obvious remedy for this unsatisfactory state of matters is to lift the roots when the foliage has died off, to dry them well, and replant in autumn. In many cases, however, my own being one of these, this involves too much work. Growing, as I do, a large collection of plants it is found exceedingly troublesome to grow many which require annual lifting, drying off, and replanting. By accident I have, I am glad to say, discovered how to flower Anemone fulgens annually without lifting.

In planting a number of roots a few years ago I placed one on a high position on a dry rockery fully exposed to the sun. This alone of the number I had has continued to flower from year to year, and I purpose increasing the number thus planted. I am aware that in many gardens no difficulty is experienced with this beautiful Windflower, but where this is felt the plan of planting on dry rockwork might be adopted with advantage. I refer, how-

ever, to properly constructed rockwork in terraces which, while securing perfect drainage, do not allow the rainfall to run off without reaching the plants.—S. Arnott, Dumfries.

LYCASTE IMSCHOOTIANA.

At the last meeting of the Royal Horticultural Society for this year, Messrs. Linden, L'Horticulture Internationale, Brussels; exhibited, amongst other Orchids, two very distinct new Lycastes, on which more than ordinary interest was centred. One of these,

FIG. 79.—LYCASTE IMSCHOOTIANA.

L. Imschootiana, is depicted in the illustration (fig. 79). This is a hybrid from Peru, and is said to be the result of a cross between Lycaste Skinneri and Maxillaria nigrescens. In habit of growth it resembles the former parent, the flowers also being about the same size and shape. As regards colour, however, they are very distinct. The petals and sepals are pale yellow densely spotted crimson, whilst the lip is also yellow of a brighter shade. An award of merit was adjudged for this fine hybrid.

LÆLIA FINCKENIANA.

THE illustration (fig. 80) published on page 557 represents a plant of this beautiful Lælia, which was exhibited by C. W. Fincken,

Esq., Hoyland Hall, Barnsley, at the meeting of the Royal Horticultural Society on Tuesday, December 14th. It is supposed to be a natural hybrid, and appears to be allied to L. anceps. As will be noticed in the engraving, the plant exhibited had one spike, on which were six flowers. The sepals and petals are white, with a deep violet-tinted blotch on the lip. The flowers are medium-sized, but of an attractive appearance, and the plant merited the first-class certificate which was awarded on the above-mentioned

ORCHID LESSONS FOR YOUNG GARDENERS. ROOTS AND THEIR REQUIREMENTS.

WHEN Orchids were first brought into British gardens, and for a considerable period afterwards, they were regarded as mysterious plants, most difficult of cultivation and beyond the powers of any but trained specialists. Mysterious Orchids still undoubtedly are, but only in their structural peculiarities, for most of the unfounded notions respecting their culture have been removed, and there are few members of the family that can be said to still afford serious puzzles to the grower. The fact is that every well trained gardener can soon master the requisites of success in Orchid growing, and it is quite possible for a man with no special knowledge of gardening, if he be intelligent, observant, and attentive, to perform under good direction all the operations needed. In the early stages of my experience I was requested by my employer to visit a nursery where Cattleyas had for some time been grown with much more than ordinary success, and the object was to pick up a few hints to guide me in my work. Like many young men in starting who are very anxious to give satisfaction I had invested Orchid growing with imaginary difficulties, and I was prepared to find that the grower in charge was a kind of horticultural genius, and to admire him accordingly. The manager took me into the spacious house where the grand Cattleyas were flourishing, and gave a brief outline of their routine, which I found to be as simple and reasonable as nursery management usually is. "But of course the man in charge has had considerable experience with Orchids," I ventured to remark, and the reply rather surprised me. "Certainly our grower has had good experience here," he said; "but when I brought him into this house I do not believe he had ever seen an Orchid. I knew he was a careful and attentive workman. I gave him a week's instruction and close supervision, found he was to be trusted, and I have never had any trouble since; in fact, he knows more about the plants now than I do.'

It must not be supposed that I wish to lessen the credit due to any successful grower by making too light of the work, but I desire to remove the idea that there is anything in Orchid culture which a careful gardener cannot overcome, and many could be pointed out who have gained no mean degree of fame as cultivators who were appointed to their charge solely because they had proved their skill and care in general gardening. The qualities needed to render a man successful in any department of horticulture are exactly those which applied to any other branch would give similar results. It is a long experience and a full conviction of the truth of this which has awakened in me a respect for specialists, as I have never known a man who had made a name with Chrysanthemums, Orchids, fruits, or vegetables, either as a private grower or as an exhibitor, who had not also proved himself the possessor of valuable qualities that would have rendered him a formidable opponent in whatever he undertook. The phrase "know something of everything and everything of something" is a good one for gardeners to bear in mind.

One quality which is of the greatest importance to a gardener is observation, and as it is of equal importance in the cultivation of Orchids it cannot be too strongly impressed upon young men that the best training, experience, and opportunities are lost unless they learn to use their eyes, note keenly, and remember carefully whatever bears upon their work and the welfare of the plants in their charge. Some of the most famed horticulturists of the present day freely admit how much they owe to the faculty of observation, which is essential alike to the beginner and the overseer, and those who would distinguish themselves as cultivators of Orchids or other plants must strive also to cultivate this quality in themselves. It was my good fortune to have a long and careful training under a practical gardener of the old school who had had too much experience to depend upon "rule of thumb" practice, or to think that a young man could be made a good gardener by learning rules by rote. His lessons sunk deeply into my mind, and much of the satisfaction and pleasure I have derived from my calling since then is entirely due to the direction given to my thoughts. Most earnestly was it always impressed upon me that observation and attention, combined with a genuine interest in the

work, were indispensable to anyone engaging in gardening, and as I have proved the advantage derivable from a development of those qualities it is given as portion of this preliminary lesson, not only for the benefit of beginners in Orchid culture but for young

gardeners generally.

Advancing one step farther, an early lesson given me by my old and respected instructor was founded on the horticultural text, "Take care of the roots." This seems so simple and obvious a precaution in plant growing, that it is always difficult for experienced men to understand how it can ever be disregarded; but the simple things are often neglected, and thus it is we too often find that only repeated instructions will induce young men to attach to it due importance. It is painful to see the roots of plants treated as barbarously as they frequently are, and just as surprising that anything like success can be expected to follow. Whether we are dealing with fruit trees, Vines, vegetables, or Orchids, with plants generally, it is not possible to be too careful in impressing the axiom, "Take care of the roots."—ORCHIDIST.

(To be continued.)

LONDON CITY GARDENS: PAST AND PRESENT.

(Concluded from page 526.)

NOTABLE amongst the open spaces of Old London were its numerous churchyards; even in the limits of the City proper there was considerably over a hundred of these after the Great Fire led to the remodeling of the metropolis. Few of them presented a garden-like aspect to our ancestors; some shrubs or trees grew in them, but could not be said to flourish. If these were, to use a modern phrase, the "lungs of London," they must have been unhealthy ones, for the way in which burials were ordinarily carried out made the graveyards far from sanitary. Many of these have now been built over, or lines of streets cross them, others have become yards used for business purposes, and some have been turned into private gardens, these being of small dimensions mostly, and difficult to find amongst the blocks of huge buildings which frequently surround them. Chiefly by the exertions of the Metropolitan Public Gardens Association, which has done so much for the preservation and increase of London's open spaces, several of the long-closed churchyards in the City have been turned into pleasant and much appreciated resorts, and there are still a number of them, at present closed, which we may hope some day to see turned to account, and planted with shrubs or flowers.

The City churchyards have still amongst them a fair sprinkling of trees, and some are conspicuous in other parts, though none of great age are to be seen. London trees have not only its atmosphere to contend with, but even there insect foes are active. In a contemporary in 1877, one of the contributors supplied a calculation of the number of trees growing in central London, and he was able to count up about 1200, which was rather surprising, and if some have vanished, others have been planted since that will replace them. Though the soil of the City is less moist than it used to be, the Poplar may still thrive, and the Willow too, only the goat caterpillars will persistently molest them. But the principal tree is the Plane. This observer reckoned 520 of these, almost half the total of the City trees, and mostly of the western species, one of Tradescant's introductions during the reign of Charles I. But the Oriental Plane had preceded that, as it was planted about London by the middle of the sixteenth century. In busy Cheapside, the large Plane at the corner of Wood Street yet continues to mark where once was the churchyard of St. Peter le Chepe. Not very many years ago it had six rooks' nests; the number diminished to a single pair, then none. It was in Gray's Inn Gardens that the rooks tarried last, after they had quitted other rookeries near the heart of London. Visitors to the City have a good sample of its Planes in those to be seen along Queen Street, and indeed hardly another species can be said to grow better in London air than the Plane does, as witness the noted specimen at Stationers' Hall still existing; but the Lime and Ash bear smoke fairly well; the Elm also. Around Smithfield, for instance, were rows of Elms. The solitary tree of St. Paul's Churchyard was, I believe, an Elm. This is the one made memorable by Leigh Hunt, who tells a story of some City child that had never seen any tree but this. He would be glad, if living, to notice a number of young trees around the precincts of the cathedral, and the churchyard is one of the favourite resorts of those seeking a change of scene during the intervals of their daily work near. Its extent is nearly 2 acres, and the space is turned to good account. There are well kept flower beds, and a fountain adds to the attractiveness.

Others of these City gardens also exhibit fountains, and we may likewise see rockeries, sometimes well contrived, but I feel inclined to object to one or two, where fragments of old tombstones have been used partly in their construction. Pigeon-houses have also been introduced to give a semi-rural aspect, and possibly by-and-by we may see aviaries. A variety of flowers is displayed in the summer season by the bedding-out system, and in spring by the flowering of bulbs, and most gardens have a few herbaceous or perennial plants, upon which less reliance is placed now. London gardens of the old type had these in predominance, the spaces between them being yearly sown with annuals, not to much profit; in fact annuals, as a rule, cannot advantageously be sown in London, the cats and sparrows being much against them, and the soil of the ordinary bed is apt to cake upon the surface if watered, so that the seedlings have difficulty in breaking through.

Many shrubs have been planted in the former burial grounds of the City, and some that seem unlikely to thrive amid smoke have grown fairly well. The calculation of trees in 1877 did not include shrubs, of which the City has always had a number, both of deciduous and evergreen species, such as the Elder, Privet, Lilac, and Laburnum, also the Holly, Aucuba, Portugal Laurel, Box, and Euonymus. It is curious to note how stationary some of these appear to be from year to year, making no appreciable increase in size. One singular effect of the drought of 1893, and the late rains of autumn, was that many London trees and shrubs put forth a crop of leaves at a time when they are usually bare, and retained

these till nearly the end of October.

St. Botolph's garden, Aldersgate Street, is another garden of about an acre in the heart of the City, and so popular on fine summer days that the ground is often crowded with visitors, the conduct of young and old being generally good. The grounds of two other City churches of like name being also much appreciated, especially the half acre of St. Botolph, Aldgate, at the junction of the City and East-end. About the same size is the churchyard of St. Botolph in Bishopsgate, which was laid out as a garden last year. Of smaller size (only a quarter of an acre) are the gardens of St. Mary Aldermary, and St. Katherine Coleman; also those of St. Bride's, Fleet Street, and St. Sepulchre, Holborn Viaduct, just beyond the City boundaries. As an example of a most valuable East London garden, not far from the Tower and St. Katherine's Docks, we might visit St. George's-in-the-East garden, formed from two old burial grounds of 3 acres, where we find a capital display of flowers from spring to autumn, looking little the worse for the murky atmosphere. When I went there one autumn day, the scene was enlivened by a number of white butterflies, which delighted the juveniles, though the gardener demurred to the mischief they had done as caterpillars.

Farther eastward larger gardens occur in crowded neighbourhoods, such as that of St. Dunstan's, Stepncy, 7 acres in extent. Spitalfields, many centuries ago real fields attached to the old hospital, now an over-populous and squalid district, has at least one garden of 2 acres attached to Christ Church, which is much visited by those who cannot reach broader spaces some distance away. Moorfields, once an extensive open space just beyond the north wall of the City, is not all built over, for we have the gardens of Finsbury Square and Circus of nearly 10 acres; upon its ground, though not as yet open to the public, are the Bunhill Fields enclosure of 7 acres, which, however, retains its character of a cemetery, and is not garden-like. On the west of the City is one of the finest spaces of central London, the 12 acre expanse of Lincoln's Inn Fields, well timbered; and along the Embankment

the familiar but smaller Temple Gardens.—J. R. S. C.

SEASONABLE HINTS ON FLORISTS' FLOWERS.

THE closing weeks of the year always more or less bring anxiety to the growers of those, which we of the older generation call florists' flowers. As I have often said, it is almost an impossibility to define what is a florist's flower, but there are certain plants which are always associated with that term, while in later years a few have been generally admitted in the same rank; although we can give no valid reason why a Pansy should be so called, and a Phlox not, yet so it is, and, like many other arbitrary arrangements in horticulture, we must be contented to let them bide. I, therefore, confine my remarks, as usual, to a few out of the many kinds of flowers that have sometimes been so designated. This time of the year is, as I have said, an anxious one, not so much from the dread of frost and snow as from the prevalence of damp; when the atmosphere is heavy and charged with moisture, plants under shelter, whether in the greenhouse or frames, are apt to suffer from it, and the greatest care is necessary.

AURICULAS.

The past season has had, I fear, an unfavourable effect on many Auriculas. They love a cool atmosphere, and hence the long terrible drought of the past summer has had a deleterious effect upon them in two ways; in the first place, their vitality to seems have suffered, and the summer losses were in consequence larger

than usual. Stating this, I am not detailing my own experience, only the same thing has been told me by more extensive growers of this class of plants than myself. Another is that there has been a larger number of autumn blooms than usual. The mild and open weather, also, has tended to increase the number of aphides, many of which may be found snugly sheltered in the upper part of the foliage. With regard to any present work connected with Auriculas, it will be simply that of removing the dead or decaying leaves, and the plants, after this is done, will present a somewhat diminished appearance. These leaves are those which have clothed the plant with beauty, and having fulfilled their task, gradually die off and must be removed, and nothing is more injurious to the well-being of the Auricula than any decaying matter of this kind; at the same time it would be well to look both in the heart of the plant and on the under side of the leaves for aphides, which should be removed when the collection is small with a soft brush. When, however, a large number are grown, this will be too tedious a process, and fumigation may be done. Where Auriculas are grown in frames and not in houses or pits, there is often great danger from There may be some small leakage in the glazing through which the wet comes, or there may be condensation, which has very much the same effect, and in a frame it is not oftentimes easy to see where the injury is; which is, however, easily discovered when grown in a house or pit. Watering will be, of course, necessary, only very occasionally; once a week being quite sufficient in dull weather.

CARNATIONS AND PICOTEES.

Here again we have to repeat that damp is the great enemy we have to contend with; when black spot, which is a fungus, appears on the leaves it is a pretty sure token that something is wrong. Affected leaves should be cut away and the plants well dusted with sulphur, for it is very contagious. So far those who have trusted their border Carnations to the open ground have had a favourable time, but I believe for the greater number it is far safer to keep them in pots in frames during the winter, as has always been done with the florist varieties. I know of some growers who have recommended the former plan have, after the experience of two or three seasons, reverted to the latter practice. The milder weather will probably make aphides troublesome, and they may be eradicated in the same way as from the Auricula, or the shoot may be passed between the finger and thumb, so killing the aphides. Where the collection is large, fumigation had better be resorted to.

GLADIOLI.

Never during the thirty or forty years that I have grown these plants have I been so late in lifting them as in this season. Various causes have contributed to this, the chief one being the illness of my gardener, which has thrown me very much behindhand in many things, and I have not now (December 1st) lifted more than one half of my Gladioli. I have, of course, as I fear I must always have in this garden, a considerable loss of bulbs, but certainly not in any way equal to that of last year, while the sound ones I have lifted are very strong. My friends Messrs. Lindsell and Fowler give the same account of theirs. I am still as perplexed as ever at the cause of my losses. I find them, as in last year, amongst imported and home-grown bulbs, and as yet there seems to be no preventive or remedy. As I no longer exhibit, and grow only for my own pleasure, I am about to try this season the experiment of leaving some in the ground all the winter, giving them some slight protection either of ashes or cocoa-nut fibre. I want to see whether they will fare better that way than by being taken up and dried. That the disease has something to do with the character of the soil I have now very little doubt. Some kinds are more liable to it than others, but it is a sore trouble to all those who grow Gladioli. Some per centage of loss appears to be the misfortune of all growers, and to some, as with myself, in greater mcasure.

PANSIES.

The past hot summer was very unfavourable to those in the south of England who grow these plants; there is nothing to which they more strongly object than drought, and whether kept in pots or planted out, there were considerable losses among them this year. Mine have been put into pots, where they will remain until the spring. There will be the necessity for watching against damp, which they greatly resent, however much they may like moisture. It is a curious thing to notice the collapse of the show varieties, as they were called, for in writing of Pansies hardly anyone now seems to think of anything but the fancy kinds, their stronger constitution and greater variety of colour giving them a decided preference.

Roses.

One hardly likes placing these amongst florists' flowers, yet I suppose they must, strictly speaking, be called so. So much is written

in the Journal concerning Roses that it is almost unnecessary to say anything about them. One is, however, in a difficulty this year; I generally mulch my beds at this season, but this year, owing to the failure of our cereals, it is impossible to get straw, and I have been obliged to get moss litter instead. This will not do for mulching, and consequently all that I can do is to earth up the plants as if they were Potatoes, and in lieu of the nutriment they would get from the farmyard manure I must supply them with larger and more frequent doses of liquid manure later on.

TULIPS.

Of these I have little to say, as I am not in the strict sense of the term a Tulip grower. I possess a bed of fairly good kinds, and these I have been able to plant in good condition a little later perhaps than the orthodox time, which used to be considered the 9th of November. I hardly look forward to the resuscitation of the taste for Tulips which I remember to have been so general in my younger days; they are still much sought after and valued in the north of England, though about the metropolis and the south I see but little signs of a revival. I fear that they entail too much trouble to suit the style of gardening which is prevalent in our days.

There is one thing which must be carefully looked after as regards those plants of whatever kind which are wintered in cold frames, namely, their protection from frost; when this sets in the frames should be covered with mats or other warm material and the plants kept perfectly dry, and it will then be found that the frost does little or no injury to them.—D., Deal.

BLACKBERRIES.

The Bramble or Blackberry is a common shrub in the hedge-rows, copses, and woods of this country. It produces an abundance of fine fruits, which are oftentimes gathered and made remunerative. Blackberries are esteemed by rich and poor for their good qualities, either raw, cooked in pies or puddings, or preserved, the jam being wholesome and of a very rich flavour. They also furnish an excellent home-made wine. Several varieties of the Blackberry have been originated in America, either by cultivation, selection, or crossfertification, large, handsome, juicy, rich flavoured fruits, and withal very productive. These varieties, however, have not proved satisfactory in this country, they requiring warm weather in May or June, and good harvest weather to ripen their fruit and canes. The two most generally cultivated are the Parsley-lcaved and Wilson Junior. The former has large, black, juicy, richly flavoured fruits. It is an immense bearer, a vigorous plant of three or four years' growth trained to a trellis or wall, yielding 100 to 120 quarts of berries in a season. Its habit is very robust and trailing, producing canes 10 to 15 feet long, which push laterals the following year 2 feet long, bearing rose-coloured flowers in July, and splendid fruit in August onwards. It is hardy and reliable, a selected form of R. laciniatus, and superior to it. Wilson Junior has also large, black, juicy, and richly flavoured fruits. It is a medium grower and very prolific.

Blackberries are best increased from cuttings of the roots, and covering the joints of the shoots with soil. Root-cuttings are obtained by digging up the roots and cutting them into pieces about 2 inches long, placing these about 3 inches apart and the same depth in light soil in the autumn or early spring. Layering the points of the canes in August or September is soon followed by stocky young plants. As soon as the tips grow nearly bare of leaves and become dark in colour, peg them into the ground 3 or 4 inches at an angle of about 45°. In a month to six weeks they will form roots, and can be cut off and planted where required. To obtain strong plants, stop a vigorous young growth when 2 feet high, this will cause it to throw out several laterals, and the points of these layered early become well

rooted by the autumn.

The Blackberry neither likes cold wet clay nor poor dry soil, but a deep, free, fertile medium, and of such they are worthy. It must be free from stagnant water, yet moisture should be within reach of their roots. The smaller and younger the plants, providing they are ewell rooted, the safer they are removed, and more satisfactory they grow afterwards. They are best planted in the autumn, not exposing the roots needlessly, such exposure being one reason why a large per centage of these plants often die. Spring planting may be practised if the conditions named are carried out, subsequently watering and mulching to insure uniform moisture in the soil. The canes should be cut down after planting also in the second year if the growth is not strong. Wilson Junior may be planted in rows 5 feet apart and 3 feet between the canes in the rows Strong growing sorts like the Parsley-leaved require much more space—namely, the rows should not be less than 9 feet apart, and the plants $4\frac{1}{2}$ feet asunder in them, and trained to stakes or trellises. Trellises are best fixed about 48 inches from the line of plants, so that the fruiting canes may be thent over to them, thus allowing the young canes to come up

separate from the bearing canes, which facilitates picking the fruit. The Parsley-leaved variety is excellent for covering old walls and training over arches. Dispose the canes thinly and cut them out after fruiting, having a supply of strong summer growths which have not been crowded to secure in the place of those removed.

Blackberry plants, well treated in the first and second year after planting out, will afford considerable fruit in the third summer, some in the second, if the plants make good canes the first year, and in the third or fourth year, as the case may be, they will fruit bounteously. How long they will bear profitably depends on the soil and treatment. In good soil and with generous treatment the plants will continue bearing satisfactorily for ten years, but if the old stools become weak, the shoots are thin, and the fruit small, the Blackberry grower will anticipate this by making new plantations in advance of cutting out the old plants.—G. Abbey.

SETTING UP WIND-BLOWN TREES.

THE gale of November 18th was almost as noteworthy for the damage wrought by its influence on plantations as the one of October 14th, 1881. Some estates that suffered severely then were little the worse this one, while some that escaped last time have been all but ruined now. A feature of these gales, which may easily escape notice, is the harm they do to growing trees which apparently are unscathed but which may be loosened at the roots, or so torn at the forks or clefts in the main branches that they either die slowly where they stand, or in some gale in the near future are limbed or uprooted. I particularly noticed trees that succumbed this time which had been loosened years ago, and during the height of the last gale I saw many trees with loosened roots that it would be impossible to observe had received any harm directly the wind had fallen.

In portions of the pleasure grounds hardly a Conifer, Holly, or Yew escaped without being either loosened or blown more or less from the perpendicular. Two trees were laid prone. With one there was no difficulty in placing upright, as it had been only a dozen years planted; but the other, a Yew 45 feet in height, and with a spread of branches of over 30 fect, and of unknown age, could only be uplifted by means of powerful appliances. As there is certain to be many trees of large dimensions that their owners would gladly see placed in an upright position if sure it can be done, and the tree not suffer much afterwards,

the details of the method we use may be helpful.

In the first place it will be perceived that little more than one-half of the roots are torn from the ground, and that the chances of success with healthy, well rooted trees are therefore good. If the tree is old and many of the roots decayed the chance of the tree surviving is very slight. Another point is that the tree must either be set upright without loss of time, or if this cannot be undertaken at once, then the roots should be covered with moist material until it can be done. If there is a staff of men sufficient to allow them to work in two sections, so many may proceed to make an excavation 2 or 3 feet wider than the broken roots extend, and deep enough to allow the roots to be buried somewhat deeper than they had been growing. The reason for doing this is that they may have a wider range of good soil to feed upon for the first two years, and also that they may be less affected by dry weather, at the same time that the increased depth of soil is a help to keeping the tree more secure. A cartload of good fresh soil ought also to be placed in the bottom of the excavation for the roots to lay upon, meanwhile the other men are engaged in raising the tree. A powerful screwjack facilitates this operation, and two of these are much better than one, as there is then no need for propping the tree, as there is with only one jack every time that a fresh lift is made.

When the tree is raised sufficiently to work block and tackle, the jack is dispensed with, and the tree drawn into position by means of strong ropes. If there is no tree or other means of attaching the further end of the tackle to, an efficient "grip" is obtained by placing a cart filled with stones, side on, and about 50 to 80 yards away from the tree. The rope is run underneath the cart in a line with the axle and attached to the nave of the further wheel on the outside. The "pull" is downward, as well as toward the tree, and even without the aid of a strong stake driven in to keep the last from moving, I have seen large trees successfully drawn up. For moderately large trees, two strong stakes driven 3 or 4 feet into the ground, and lying at an angle of 45° away from the trees, the rope being attached close to the ground, is fairly safe and good. A double block and tackle is much better than a single one. Guy ropes are safe for keeping the tree from swaying, and as the stem is gradually drawn nearer the perpendicular, struts must be kept moved to support

the tree in case of accident to the tackle.

The Yew above referred to, owing to its great weight of branches and foliage. broke a rope three times before it was brought to an upright position. Through being securely supported with struts we did not lose anything, and at the same time saved the tree and other shrubs from further damage. I put four cartloads of good soil about the roots of this tree, and about six tons of stones above the roots to steady the tree, and in addition to three wooden supports tied to each other, four strong wire ropes guy the tree. These are secured to oaken posts driven into the ground. Keep the roots from drought, especially during the first year, and an occasional surface dressing of good soil or manure is of the utmost benefit to trees that have been uprooted and lifted to their old positions.—B., East Lothian.

MATTER FOR PUBLICATION.—Communications for insertion in our next issue should, where it is practicable, arrive at this office on Saturday, this week. Correspondents will oblige by noting this intimation.

- THE WEATHER IN LONDON.— The past week has been characterised by changeable weather. A frost occurred early on Sunday morning, followed by a fog. Monday was fine and mild, but it rained heavily on Tuesday. Wednesday opened wet, the rain continuing as we are going to press. It is very mild for the time of year.
- THE WEATHER IN THE NORTH.—The weather of the past week has been variable. There has been but little frost. High westerly winds have generally prevailed, and a good deal of rain has fallen. Snow fell on the mornings of the 12th and 13th, but thaw soon followed. Sunday was fine throughout, and Monday was wet in the former part, but fine in the afternoon and evening.—B. D., S. Perthshire.
- WE are informed that the Lord Mayor of London has undertaken to take the chair at the next anniversary festival of the ROYAL GARDENERS' ORPHAN FUND. The dinner will be held at the Hotel Métropole some time in May, the exact date not being yet definitely fixed.
- ROYAL GARDENERS' ORPHAN FUND.—As we are now on the eve of the season when it is believed that the human heart is specially open to generous appeals, kindly permit me to invite all subscribers to the Royal Gardeners' Orphan Fund to remember, in the marking of their voting papers for the February election, the most necessitous of those cases that last February failed to secure election, in preference to new ones. There are some that will start with a good number of old votes. These should have the best chance of election, and, so far as possible, where really meritorious, should not be allowed to endure two disappointments. Still only five orphans can be elected. That seems to be an additional reason why the non-elected of last year should have first consideration.—Subscriber.
- INDEX KEWENSIS. After a commendably short interval since the publication of the first part of the Index Kewensis, we are now presented with the second part, which extends from Dendrobium to Justicia. The character of the work is well sustained in every particular as to authorship, typography, and execution, reflecting the highest credit, both on the staff at Kew and that of the Clarendon Press at Oxford. As a work of authority it will long hold precedence, and be regarded as a necessary adjunct to every scientific library, being what Linnæus said of Caspar Bauhin's Pinax—another noted "Index."

Opus est hactenus sine pari Opus est quo, nullus carere potest.

- THE ROYAL HORTICULTURAL SOCIETY.—We learn that arrangements have been made to hold the Exhibitions and meetings of the Royal Horticultural Society during the year 1894 on the following dates:—January 16th, February 13th, March 13th and 27th, April 10th and 24th, May 8th; and Temple Show on May 23rd, 24th, and 25th; June 12th and 26th, July 10th and 24th, August 14th and 28th, September 11th and 25th, October 9th and 23rd, November 13th and 27th, and December 11th.
- DEATH OF MR. A. K. ANGUS.—We much regret to learn of the death of Mr. A. K. Angus, which occurred last week at the Carlton Hotel, Leicester. Prior to becoming the landlord of this excellent commercial house, where he lived for nine years. Mr. Angus was a gardener. He went from the gardens of the Royal Horticultural Society at Chiswick to in a large measure form and furnish the fine gardens of C. H. Wilson, Esq., Warter Priory, Pocklington, which he managed with great success. He was very able, and attained a good and much-respected position in Leicester, as was testified at the funeral. Mr. Angus always gave an hospitable welcome to horticultural friends. His love for gardening never left him, and he bought a walled-in space, wherein he could dig the ground and cultivate crops. The cause of death was rheumatic fever. Mr. Angus was born in Aberdeen in 1853, and was thus only forty years of age. Much sympathy is felt for his widow in her great bereavement.

- NATIONAL AMATEUR GARDENERS' ASSOCIATION. The members of this Association held their third annual dinner at the Holborn Restaurant, London, on Thursday, December 14th, under the chairmanship of Mr. T. W. Sanders. Nearly a hundred ladies and gentlemen were present, and a most enjoyable gathering resulted. In proposing the toast of the evening, the Chairman remarked that there were about 500 members on the books, and several affiliated societies, including one in Tasmania. Numerous silver and bronze medals, also certificates, were presented to members who had won such during the year. A feature of the evening was the presentation of a handsome silver tea and coffee service, with an illuminated address, to Mr. D. B Crane, the energetic Honorary Secretary.
- The Royal Botanic Society.—We understand that the exhibitions held under the auspices of the Royal Botanic Society for 1894 will take place as follows:—Spring Shows, March 14th and April 18th; Summer Show, May 23rd; Special Floral Fêre, June 20th; Evening Fête, July 4th. Musical Promenades will also be held on Wednesdays in May, June, and July, with the exception of fête days. Lectures are to be given on Fridays in May and June at four o'clock. General meetings will be held January 13th, 27th; February 10th, 24th; March 10th, 31st; April 14th, 28th; May 26th; June 9th, 23rd; July 14th, 28th; November 10th, 24th; and December 8th. The Society's annual meeting is arranged to take place on August 10th, at one o'clock P.M.
- SULPHATE OF IRON FOR FRUIT TREES. A foreign paper states:—Professor Sachs of Wurzburg asserted, and the Royal Institute for Fruit and Vine Culture at Giesenheim has tried experiments and is apparently satisfied, that sulphate of iron is a valuable stimulant to plants that are suffering from chlorosis, or absence of the proper green colour. They gave small trees 2 1-5th lbs. of copperas, and large trees 4 and 2-5th lbs. The results, it is said, were most gratifying. Strange to say in some cases where the trees were suffering from the attack of aphides as well as deficiency of colour in the leaves, the aphides disappeared, and frequently the leaves became healthy within a few days after the treatment. The sulphate of iron was dissolved in water, and applied near the roots. Early spring is the best time to try the experiment. Some soils do not require the addition of sulphate of iron.
- THE PERFUME OF FLOWERS.—Mr. E. Mesnard has been making researches into the origin of perfume in flowers, and comes to the conclusion that (1) the essential oil is generally found localised in the epidermic cells of the upper surface of the petals or sepals. It may exist upon both surfaces, especially if the floral parts are completely concealed in the bud. The lower surface generally contains tannin or pigments derived therefrom. (2) The ehlorophyll seems in all cases to give rise to the essential oil. (3) The disengagement of the perfume of the flower makes itself perceptible only when the essential oil is sufficiently disengaged from the intermediate products that have given rise to it, and is found, in a manner, in a ratio inverse to the production of tannin and pigments in the flower. This, says Mr. Mesnard, will explain (a) why flowers with green petals have no odour; (b) why white or rose-eoloured flowers are most often odoriferous; (c) why the Compositæ, which are rich in tannin, have the disagreeable odour that they are known to possess; and (d) why the white Lilac and forced Roses take on a finer perfume.
- ROYAL CALEDONIAN HORTICULTURAL SOCIETY.-The annual meeting of this Society was held on the 7th inst. in Edinburgh, Mr. R. Lindsay, President, in the chair. Mr. Fraser, the Treasurer, submitted the accounts for the year ending 30th November, which showed that members' subscriptions had amounted to £108, special subscriptions to £37, and the drawing at the shows to £1044 —the total receipts for the year having been £1549. On the other hand, the expenditure had been £1578, the show expenses having been £604, the amount of prizes paid £854, and the general expenses £80. At the 30th November the funds of the Socie y amounted to £1183 6s. 9d., as compared with £1261 0s. 8d. at the corresponding date last year, being a decrease of £80 13s. 11d. The income for the year had been £28 17s. 9d. short of the expenditure. The accounts were approved of. Sir Thomas Gibson Carmichael was appointed a Vice-President in room of Lord Balfour of Burleigh. Messrs. D. Mitchell, Comely Bank, Edinburgh; C. Buchanan, Penicuik; and James Morrison, Archerfield, were elected to fill vacancies in the Council. Mr. Maleolm Dunn, Dalkeith, in moving the re-election of Mr. Fraser as Treasurer, and Mr. Charles Stewart, W.S., as Sccretary said if the funds were a little less than hitherto this year it was due wholly to exceptional expenditure.

- —— It is reported that BARON DE GOLDSTEIN, the newly appointed Dutch Ambassador to this country, is the President of the Royal Netherlands Horticultural Society.
- THE AMERICAN DEWBERRY.—An Asiatic contemporary says that among exotic fruits recently introduced into India, one of the most promising seems to be the American Dewberry, which bears fruit profusely in the Shaharanpur Botanic Gardens.
- —— BOLTON HORTICULTURAL AND CHRYSANTHEMUM SOCIETY. —Mr. James Hicks, Secretary, informs us that the next exhibition of Chrysanthemums and other flowers, fruit, and vegetables under the auspices of this Society will be held on November 16th and 17th, 1894.
- THE DEATH OF MR. J. WELLS took place on Saturday, 9th inst., at Osborne Park Nurseries, Potter's Bar, Middlesex. He was considerably over eighty years of age, and in former years was for a long time gardener at Holme Lacy, Hereford, where his services were highly appreciated by the late Lord Chesterfield, who was Sir Henry Scudamore Stanhope in Mr. Wells' time.
- RAILWAY GARDENING.—Some years ago the Midland Railway directors decided to set aside £150 annually, to be allotted as prizes among the station masters throughout the system as an encouragement to them to render their platform garden borders as attractive as possible. This year's awards have just been distributed, and range from £6 to 5s. Matlock Bath takes the first prize, and amongst other Midland stations securing prizes are Sandal and Walton and Woodlesford.
- A NARCISSUS (DAFFODIL) SHOW will be held in the Botanical Gardens, Edgbaston, on Wednesday and Thursday, 18th and 19th April, 1894, under the auspices of the Birmingham Botanical and Horticultural Society. A liberal prize schedule has been prepared, no less than seventeen classes being provided. Any intending exhibitors must give notice in writing of the classes in which they intend to exhibit, and, in the case of honorary exhibits, the table space required, to Mr. W. B. Latham, Curator, Botanical Gardens, Edgbaston, Birmingham, on or before April 13th. F. W. Burbidge, Esq., F.L.S., Trinity College Gardens, Dublin, has been invited to act as judge.
- —— PACIFIC COAST IRISES.—A correspondent writes to an American contemporary:—"Oregon collectors are offering Iris macrosiphon, and describe it as having a cream-coloured flower. It is common on the coast range of Northern California and North Oregon, and where it is generally a lilac-purple. I have seen detached clumps which were pure white. In the range east of Ukiah it frequently varies to cream colour, and in one locality, within a half mile, it runs from purple through bronze-purple to rich bronze and to cream colour. Like all the Pacific coast species, the masses are dense, with rootstocks hard and rather slender. It prefers a gravelly soil in open woods. I have naturalised Iris Douglasiana with success in my Fern beds, where it shows well with its yellow purple-lined flowers. It runs through the eastern edge of the Redwood belt. I. Hartwegi is a somewhat similar species with yellow flowers, found in the open woods of the Sierra, flourishing in the peculiar dry, red, granulated soil."
- ANCIENT SOCIETY OF YORK FLORISTS. The annual dinner of the Ancient Society of York Florists was held on the 13th inst. at Harker's Hotel, York. The Lord Mayor of York (Mr. Alderman Clayton) presided, and was supported by a large number of other gentlemen. Mr. Alderman Rymer in proposing the "Ancient Society of York Florists," said they had a right to lay claim to their title, for they knew that the records of the Society went back 100 years, and tradition took it back further. There was no doubt that the Society had had its ups and downs, but it was never more prosperous than at present. It deserved to prosper, seeing that its aim was to cultivate and encourage the cultivation of all kinds of flowers. The Chrysanthemum Show had had the effect of resuscitating their funds, and had placed them on their legs financially speaking, and had given incalculable pleasure to numberless citizens of York. Mr. J. Key replied, and spoke of the rapid progress of the Society during the past twenty years. They had now in round numbers about 600 members. Mr. Lamb said that their total receipts for the year had been £680, and the expenditure about £528, leaving a balance of about £160. Mr. J. B. Sampson offered a standard work on botany as a prize to scholars, and hoped the Society would take the matter up. Mr. J. J. Hunt also offered £5 as a special first prize for dessert table decorations at the next Chrysanthemum Show, which doubtless will take place on November 14th, 15th, and 16th.

- —— SEAWEED, though not the diet for an epicure, is, when dry, says an Australian writer, richer than oatmeal or Indian corn in nitrogenous constituents, and takes rank among the most nutritious of vegetable foods.
- —— EARLY SNOWDROPS.—Colonel Mesham writes from Pontryffydd, North Wales;—"In most years I have been able to gather some Snowdrops on Christmas Day, but this year I have found several in bloom under the trees in my shrubberies on the 17th inst."
- WE are informed that the Russian traveller, M. POTANIN, who has spent more than a twelvementh in a botanical exploration of Thibet, is expected in St. Petersburg in January next. M. Dobrotworsky has arrived at Jenisseisk on the Jennissei, on a botanical expedition.
- LADY HUTT AND APPLEY TOWERS GRAPES.— "S. W. F." writes:—"I should be interested in hearing the experience of your Vine-growing correspondents with the Grapes Lady Hutt and Appley Towers. They were sent out with a great flourish of trumpets, but since that time I have not seen a reference to either variety in the horticultural press."
- ARISTOLOCHIA SIPHO SEEDING. Miss S. C. Smith, New Galloway, Kirkcudbrightshire, wishes to know through the *Journal of Horticulture* if it is usual for the Aristolochia Sipho to seed in this country, because hers did so this season. The seed pod is like a small Vegetable Marrow and well ripened, and her plant was five years old. Miss Smith has been told by gardeners in her neighbourhood that they had not heard of such an occurrence before.
- THE MIDLAND CARNATION AND PICOTEE SOCIETY.-A copy of the Report for 1893 of the Midland Carnation and Picotee Society has come to hand, and this asserts that the popularity of the Society is proved by the large increase of members, which rose from 152 in 1891 to 204 in 1892; the number still further increased in 1893 to 242, and twelve new members have already promised to support the Society for 1894. The season of 1893 was one long to be remembered for its prolonged drought and great heat, and cultivators experienced much difficulty in keeping down the ravages of thrips and other insect pests; and it was feared for a time that the date fixed for the exhibition would be too late owing to the flowers being driven into bloom so rapidly and prematurely; but to the surprise and intense gratification of the Committee the entries and exhibits were far beyond their expectations, no less than forty-six members bringing flowers, and a very fine exhibition was secured. The success of the exhibition again enables the Committee to give a donation of £5 each to the Gardeners' Royal Benevolent Institution and to the Royal Gardeners' Orphan Fund, and they hope to be able to continue this help each year. The financial statement shows a balance of £50 7s. 3d. The schedule for 1894 will be published in January, when the Committee hope to increase the prize list to £120.
- INSECT PESTS.—An Australian nurseryman referring to the three common pests on fruits and flowers-viz., scale, aphis, and mildew, gives some practical hints from his own experience. In the case of the coccus or scale insect and the aphis or green fly, he recommends kerosine emulsion as the most simple, effective, and the easiest applied. The following is the recipe: Boil softsoap in just sufficient water to dissolve it (1 lb. soap to 12 pint water), then add 1 pint of kerosine. When thoroughly mixed 1 quart will be sufficient for 3 gallons of water, and the mixture should be applied with a fine nozzled syringe. In the case of the aphides one good dressing is generally effectual, but when applied to the scale the greatest care should be exercised, so that every part of the tree gets thoroughly saturated, more especially underneath the leaves, for if this is neglected all the insects so secured will remain untouched, and form a new stock for further destruction. The oïdium or mildew, different from the two preceding pests, is due to a fungus, and in its early stages consists of a white coating over all parts of the infested plant. The superficial position of the fungus renders direct treatment comparatively easy, and a thorough application to the diseased part of flowers of sulphur or sulphide of potassium in weak solution (which is also recommended for green fly and red spider) will be found sufficient to put an end to the fungus without injuring the plants. But it has also been found that the same remedy as has been recommended for scale and aphides with the addition of a little flowers of sulphur, applied during the period of rest, has been found a good preventive; loose bark and the soil immediately round the plant should at the same time be removed and burnt, and every part of the plant thoroughly washed. If this treatment is adopted once a year, as a rule, it will destroy all traces of mildew.

CRYSTAL PALACE SEPTEMBER FRUIT SHOW.—Referring to this question, Mr. W. H. Divers, Ketton Hall Gardens, Stamford, writes:—"I am not surprised at the correspondence which appeared on pages 508 and 531, as I have heard many regrets expressed by fruit growers in various parts of the country on this subject. As an exhibitor there for many years I have no hesitation in adding that I should be very pleased to support the exhibition as much as possible if it is revived. I know of no building so suitable as the Crystal Palace for shows, and I must certainly add the management of all the shows which I have attended there has been all that could be wished for under Mr. Head's supervision. It is a pleasure to an exhibitor to go. The display of fruit has always been most interesting and instructive, and with the daily increasing interest in fruit culture, might reasonably be expected to advance."

BEGONIA GLOIRE DE LORRAINE.—This is a hybrid between B. socotrana and B. Dregi, the latter a Cape species in the way of B. caffra and B. natalensis, with a tuberous rootstock, annual stems bearing soft green leaves and numerous bunches of white flowers. According to an English correspondent in our excellent transatlantic contemporary, the "Garden and Forest," the hybrid was raised by Mons. Lemoine of Nancy, and exhibited in flower at the Paris Exhibition. It has been flowering at Kew for some time, and recently a few well-flowered examples of it were exhibited from the garden of L. de Rothschild, Esq. It is dwarf, rarely exceeding a foot in height, with numerous short branches, which are literally smothered with bright rose-pink flowers, which last a long time, a character peculiar to B. socotrana and all its progeny. This is the seventh distinct hybrid of which B. socotrana is one of the parents, and every one of the seven is worth a place in all good gardens. They flower very freely, usually in late autumn or winter, and their flowers are always pretty in colour and last a long time.

THE RINGS OF TREES.—The annual rings in trees exist as such in all timber grown in the temperate zone, says the "Builder's Gazette," Their structure is so different in different groups of timber that, from their appearance alone, the quality of the timber may be judged to some extent. For this purpose the absolute width of the rings from year to year, and the proportion of spring wood to the autumn wood, must be taken into account. Spring wood is characterised by less substantial elements, the vessels of the thin-walled cells being in greater abundance, while autumn wood is formed of cells with thicker walls, which appear darker in colour. In Conifers and deciduous trees the annual rings are very distinct, while in trees like the Birch, Lime, and Maple the distinction is not so marked, because the vessels are more evenly distributed. Sometimes the gradual change in appearance of the annual ring from spring to autumn wood, which is due to the difference in its component elements, is interrupted in such a manner that a more or less pronounced layer of autumn wood can apparently be recognised, which again gradually changes to spring or summer wood, and gradually finishes with the regular autumn wood.

- FRUIT PRESERVING AT SINGAPORE.-The Netherland Consular report on Singapore for last year, published a short time ago in the Java "Government Gazette," gives the following particulars regarding the preserved Pine Apple trade: — "The preparation of preserved tropical fruits, chiefly Pine Apples, increased again during the year under report, the export being estimated at 1,670,000 Pine Apples against 1,600,000 in 1891. This increase of 70,000 units is, almost exclusively, to be ascribed to the augmented export of 30,000 units to Great Britain, and 40,000 units to the Continent of Europe, mostly to France. The steady extension of this branch of industry is in consequence of the article becoming better known abroad, and of the considerable increase of Pine Apple cultivation in Singapore, Johore, and adjacent places, as also on neighbouring islets in the Rhio Archipelago. The Pine Apple crop was, moreover, very satisfactory during the past year. The price realised, on the average, fell to 2 cents for each Pine Apple against 6 cents in 1891, and this, too, in spite of an increase in preserving factories. During the year under report, at Singapore, five Europeans and five Chinese carried on the preserving business against four Europeans and three Chinese in 1891. From the above mentioned increase in the export it need not, however, be made out that the consumption abroad has grown in proportion. An inconsiderable portion of the export, indeed mostly to England, had to remain there unsold owing to a glut in the market, as also in consequence of inferior quality and less careful preparation of the product. These last mentioned consignments were largely from Chinese factories, of which during the past year several stopped business, while others were set up."

NOTES ON EUPHORBIAS.

No lengthy description is necessary to add to the charms of these beautiful plants, for when well grown they are certain to be noticed, the rich glow of colour, together with their gracefully arching branches, rendering them very attractive. Although a large genus, only a few species are worth cultivating for general decorative purposes. Those most frequently met with are Euphorbia jacquiniæflora, E. pulcherrima, and E. splendens. The last named, although very ornamental and nearly always in flower, is nevertheless not much appreciated on account of the stout sharp thorns which cover the stems. It succeeds best when planted out in the stove and allowed to remain undisturbed. The finest plant I have ever seen of this variety was growing under similar treatment to that described in the gardens of Dale Park, Arundel, Sussex. It had been there many years, and was never known to be without a flower.

EUPHORBIA JACQUINIÆFLORA.

Viewed either as regards its general usefulness or for the exquisite beauty of its bright orange-scarlet flowers, which are produced in long racemes all along the upper parts of the shoots, Euphorbia jacquiniæflora stands quite unrivalled as a winter-flowering plant. Although the individual blooms are small, they are so elegantly arranged, and produced in such profusion, that for general decoration they are invaluable either on the plants or when used in a cut state. The long, graceful, arching branches, thickly studded with flowers, also form a most charming wreath for personal adornment, for which purpose they are valued by ladies. No fear need be entertained in reference to removing a good portion of the stem with the flowers, for, unlike the majority of hardwooded plants, no damage is done by cutting, and its value is not deteriorated in any way other than by the loss of its flowers.

This Euphorbia is not very hard to cultivate after it has fairly started, but it is frequently found very difficult to establish. I find the best way to propagate it is to prepare a sufficient number of small pots by filling them with sandy peat, then place about three or four cuttings in each pot, making the compost quite firm, afterwards placing under a bell-glass or hand-light in a temperature of 65° to 70°. It is very essential that the glass be removed every morning owing to the condensed moisture congregating on it, which if not wiped off is liable to cause the cuttings to damp. When well rooted tilt the glass slightly every day, so that the young plants may not experience a severe check in removing. Where a sufficient number of cuttings can be obtained I should recommend that they when rooted be transferred from the pots in which they were inserted to larger ones, without disturbing the roots in any way. By this means much stronger shoots may be obtained, which will be a decided advantage at the flowering period. Although the general practice is to give this plant stove heat I think much better results may be obtained by growing it in an intermediate house, as flowers that expand under such conditions invariably possess more substance and last much longer in perfection than those which are subjected to a higher temperature. As the plants go out of flower the supply of water should be gradually curtailed, eventually withholding it altogether and allowing them to remain quite dry for two or three months.

EUPHORBIA (POINSETTIA) PULCHERRIMA.

This species, which is more frequently met with under the name of Poinsettia pulcherrima, differs very materially from the foregoing. The best bracts are produced on plants which are grown from cuttings every year. The cuttings should be inserted singly in small pots. When the plants are established, free growth should be encouraged by maintaining a warm moist atmosphere with plenty of light. Where space is available, I should recommend growing them in a cool house during the summer, in preference to cold frames. The advantages obtained by devoting a house to their culture are multitudinous, for not only are they more easily managed, but during a wet dull season they may be assisted by employing a little fire heat. If the roots are checked through cold or any other cause, the plants are liable to lose their bottom leaves, in which case they are disfigured for the remainder of the season. Plenty of air must be afforded them at all times, providing the weather is favourable. I have known some growers shade them lightly during the hottest part of the day, but I prefer letting them have the full rays of the sun, provided plenty of air is afforded, merely shading for a day or two after repotting. It is very important that the ends of the growth be kept near the glass, lowering them as occasion demands, as by this means much sturdier plants are obtained.

A gentle dewing with the syringe every morning and evening during the summer is very beneficial to the plants, and keeps down red spider and other insect pests. When the bracts appear more heat may be given, and an occasional application of manure water at this period will also prove very advantageous to the plants. Judicious watering is essential, as much depends upon the manner in which this is performed.

It has been repeatedly notified in previous issues of the Journal of Horticulture that there are two distinct varieties of Euphorbia pulcherrima, I will, therefore, restrict myself to merely one or two references on this point. Although both varieties are invaluable for intermixing with other plants, or where a succession of bloom is required, I should advise growers whose object is to obtain a mass of colour at one time to confine themselves to the earliest variety only. This is decidedly the better and most valuable of the two; the bracts are much paler in colour and produced with great freedom. A considerable number of plants are grown here annually under similar treatment

to that described. When the bracts appear the plants are placed in a group, filling half of one of the houses, where they produced an imposing effect.—G. PARRANT, Ashby Lodge Gardens, Rugby.

JUDGES AND JUDGING. A NEW CATECHISM.

As we gave prominence to a letter of an extraordinary character and accompanied it with pertinent comments on page 503, December 7th, and as the matter created much interest, we think the letter of another correspondent is entitled to a little more than ordinary attention in our columns.

"Berks" writes: "You wish me to give more information regarding this case. The exhibits were not pointed till the second day of the Exhibition. I think Mr. R. Laird's article settles the whole question, with the exception of who asked this expert to point the exhibits. He ought to come forward and say who appointed him. I am glad you make the remark on my note on page 529, that you carefully refrained from pronouncing the judges incompetent. Then what about the heading of your leading article, page 508, "Judges Judged—Verdict Guilty." I notice you also make remarks on Mr. R. Laird's article, page 530, stating you did not know the name of the society. I ask, why then did you send nearly every member of Committee a gratis copy of your Journal of December 7th, 1893? I regret you should publish such a charge against any society without making inquiry as to the truth of the charge.—Berks."

We are much obliged to "Berks," who takes us a step onward, and an important one too. If the exhibits were not pointed by the "expert" till the second day his figures can have little, or indeed no, weight. Perhaps the "expert," whose identity is not quite unknown to ns, may, as suggested, state hy whom he was engaged to point the blooms—the "second day?" We do not see why he should decline to do this, though he is at liherty to withhold his name from publication.

"Berks" has evidently not read our article carefully. We have had far too much experience to pronounce judgment on a case after hearing one side only, and we should he the less likely to decide against duly appointed officials, hecause we helieve that competent adjudicators are correct in nine cases out of ten when protests of misjudgment are entered; but as even judges are human, they are liable to err occasionally. The correspondent whose letter we published clearly stated, "The Committee so far entertained the protest as to appoint a competent expert to point the different stands," and he sent us the tabulated results, going on to say, "The Secretary afterwards told the 'protestors' that the Committee acknowledged the misjudgment." What could be more precise? We then said, "If the writer of the letter had made no mistake," we had a case of judging the Judges, and finding them guilty; and if the allegations were true, undoubtedly that would be so. That is our reply to "Berks" on that clanse in his catechism.

We pass to another in which he not obscurely implies that we published a statement which we knew to be false. Does he appreciate the seriousness of his inuendo? We stated we did not know the name of the Society when we published our article on December 7th. We neither knew it nor wanted to know it, preferring to present the subject on its merits as presented to us, and to guard ourselves against any charge of prejudice or hias on the part of persons who appear to be so constituted as to be unable to refrain from attributing unworthy motives.

"Berks" conveys the impression that he has found the Editor of the Journal of Horticulture guilty of falsehood. That is "judging" with a vengeance. What are his grounds? The sending of copies of the Journal of December 7th to the members of the Edinhurgh Committee! "Berks" is a gardener of great ability, intelligence, and acumen, but even he is liable to err, and has most assuredly erred in this case. We received a list of names hours after the issue was published on December 7th, for the very purpose of sending the copies in question, and previous to that neither the Edinburgh Show, nor any other show, had heen mentioned to us. "Berks" will now see "why" they were sent. The desire that they should be was, however, a very proper one, as every gentleman on the Committee was entitled to see what was said, for the purpose of making any counter-statement, which we specifically promised to insert. We kept our promise, as "Berks" very well knows, not hy publishing his note only, but a far more explicit denial hy Mr. Laird of the two cardinal allegations of the correspondent whose letter we inserted on page 503. As at the moment of writing we have not received any reply from this correspondent to the Secretary's letter on page 530, we presume he has sent his name to Mr. Laird as invited. If he has no reply to this gentleman, he will tacitly confess that he is guilty of false assertions.

Returning to "Berks." He regrets we should have published the letter of an exhibitor, who sent his name and address, without making inquiry into the truth of the charges. If "Berks" knew as much about editing newspapers as he does about gardening he would not let such "regrets" trouble him. Why should we not have made roundabout private inquiries, and obtain documentary evidence relative to the accuracy of one of his own inaccurate suggestions before publishing his letter containing it? On matters of public interest nothing hrings out the truth so well as publication, and nothing so much strengthens those who are right in their action, and weakens those who are wrong in their assertions.

Our article excited wide interest, and brought out valuable comments and suggestions on various phases of exhibiting—reckless protests, unseemly conduct by losers, judges' qualifications and methods, show managers failing to comply with their own rules, with other collatera matters were discussed, all of which require thoughtful attention with a view to the avoidance of errors, and making, as far as is possible, the shows of the future better and more agreeable to all than some of the past have heen.

N.B.—Just as we are preparing for press a letter arrives from the original complainant in this case, in which he states he intends sending a reply to Mr. Laird next week. We shall be obliged if he can let us receive it not later than Saturday this week, as our pages have to be advanced in preparation for adjournment over Christmas.

INTO the special merits or demerits of the particular case which has given rise to the present correspondence I do not desire to enter. I write simply with the object of emphatically endorsing certain remarks of your correspondent "E. K." (page 530) concerning "judging" in the abstract. Truly, the science of judging is in a condition verging on chaos. No definite principles or rules exist, and the personal tastes and idiosyncracies of the individual judges dominate the situation of the moment, and offer to the exhibitor a standard which is ever varying, and which he can never hope to retain, even if he can grasp it.

and which he can never hope to retain, even if he can grasp it.

This essential peculiarity of "present day" judging was well hrought out in your columns a few weeks ago. A correspondent and two other judges—not suggested to he less competent than himself—had to judge Dahlias. Your correspondent took one view of the consideration which should influence the award of prizes, the other two judges took another view. Who was right I do not know, neither does it matter; hut here we are shown that it was hut a matter of chance that the majority that day went the one way. Possihly at a later show your correspondent found one of his fellow judges of his way of thinking upon the point at issue, and so the verdict was reversed. But here, again, we have chance as the dominating element, and not judging on systematic and definite lines, in accordance with a standard created by authority, and in the light of which all competitors may cultivate their flowers.

"E. R." suggests "that the National Chrysanthemum Society should formulate and publish a clearly defined code of rules for the help and guidance of the judges which would understable he recorrised as the

"E. R." suggests "that the National Chrysanthemum Society should formulate and publish a clearly defined code of rules for the help and guidance of the judges, which would undoubtedly be recognised as the standard of all societies." This is exactly the suggestion made by me in the paper on "Judging Chrysanthemum Blooms," read before the General Committee of the National Chrysanthemum Society on the 11th inst. Until such a standard shall he created judging can never be completely satisfactory, even at the hands of competent judges. At the hands of the incompetent it hecomes little hetter than "confusion worse confounded."—CHARLES E. SHEA, The Elms, Foots Cray, Kent.

Some of your capable correspondents having in my opinion given conclusive evidence re the two difficulties lately mentioned in the Journal I will not trouble you with my view. What I wish now mainly to refer to is "point judging." I have no desire to be egotistical when I say that during the twenty-seven years I have acted as a judge I have frequently adopted the practice as being a great help in assisting me to form a correct judgment on the matters before me. I learnt the idea from a Hampshire horticulturist, who told me he had used the method for many years when judging, what him and me were then doing—viz., cottage gardens situated in different portions of a scattered parish. The gentleman in question has been dead some years now, and was over eighty years old when he died. I mention this to show that judging hy points is by no means a new idea. After all that has been and can he said in favour of point judging, it never can be mathematically correct. Some people speak of it as if it were so.

"E. K." (page 530) expresses my ideas best on this matter when he

"E. K." (page 530) expresses my ideas best on this matter when he alludes to the different spec acles we weak human mortals are necessarily compelled to see mundane matters through. After all, point judging is hut a help to an otherwise well halanced, well informed mind in forming a correct decision. I am not writing to run down point judging in the least, knowing full well the great value of "notes" in judging the many objects brought hefore the Judges at horticultural exhibitions, and the usually very limited time allowed them to do their work. In conclusion, allow me to say that the "experts" now so frequently spoken of as necessary at exhibitions will be likely in time to cause managers of such exhibitions much expense and trouble. Wby not have a separate "expert" to judge, say, Turnips, Carrots, Cahbages, and Cauliflowers? We have them for Onions and Potatoes, not to

mention in the same breath our reigning queen of the winter flowerthe Chrysanthemum. As an old-fashioned practical gardener on the other side of my Jubilee year, I almost dread going to act as a judge at a show nowadays, not considering myself an "expert" in anything.— YORKSHIRE GARDENER.

At the Birmingham Chrysanthemum Show, in a conversation with Mr. Robert Owen, I remarked what a blessing it would be if at flower shows the arrangements should be completed and plants in position overnight, with only the cut blooms admissible early next morning, so that judging could commence promptly at nine o'clock, or at the latest at ten o'clock. I have had considerable experience of flower show work, and have known instances at Edinburgh when everything was completed overnight, and judging commenced before breakfast. In Belgium I have seen this done, and at Shrewsbury the principal portion of the plants are to a great extent in their position overnight. I hold strongly the opinion that all award cards should be placed on the exhibits properly and legibly filled up before the public are admitted; and this and careful judging can only be done by giving more time for the work. Then, also, there should be a heavy fine of 5s. or 10s. for anyone entering in any class and not filling it, unless notice to the contrary is in the Secretary's hands twenty-four hours before the morning of the day, so that the Superintendent of the staging of the morning of the day, so that the Superintendent of the staging of the exhibits may be able to have all spaces closed up, and himself saved much trouble and worry.—W. D.

NEW VIOLAS.

(Concluded from page 439.)

IT appears to me, so far as I can judge at present, that at least fifty new varieties will be shortly sent out for the first time, and although it is strong evidence of the popularity of the Viola, I am

FIG. 80.—LÆLIA FINCKENIANA.

Notwithstanding the magnitude of this Exhibition, everything is obliged to be ready by ten o'clock on the morning of the show, and the judges start at their work immediately, and have invariably finished by

the time the public are admitted.

Birmingham is alluded to in page 530 of last week's Journal, and the rule is strictly enforced of clearing the hall at eleven o'clock. Still, that does not allow of sufficient time for the judges to do their work with ample time for consideration, and for the officials to get the prize cards properly filled up, which I regret to say at some exhibitions is done in a very slovenly manner. This is not the case at Birmingham, for at no exhibition in the kingdom is this work better done. And then the award books have to be made up for the reporters of the local daily papers, certificates and special awards made to honorary exhibits, and many little details seen to, so as to let matters run in a pleasant groove.

very much inclined to think that others will agree with me that these are far too many new ones for one season. These are in various hands, Messrs. Dobbie & Co., Smellie, Irvine, Pye, Paul, Forbes, and others, and many of the finest have been raised by Mr. J. D. Stuart of Belfast. My descriptions of the new ones must be necessarily brief, and I shall confine myself to those I have seen and know to be good. Of their bedding out properties I am unable to speak, excepting Duke of Clarence, and this is a fine variety for that purpose. All are more or less beautiful as outdoor plants, although some bloom more freely than others.

The following are the new varieties which are to be introduced in the spring, and which I have seen, and arranged alphabetically with the

raiser or introducers' name appended-viz.,

Blue Garter (J. D. Stuart).—Very like Skylark, but with lighter coloured margin.

Carissima (J. D. Stuart).—Veined rosy lilac and white; fine.

Cherry Park.—I saw this at York, and it is very like Annie King. Commodore (J. D. Stuart) .- A distinct shade of pale blue, evidently a fine variety for forming masses.

Con O'Neil (J. D. Stuart).—White with rich stripes of violet purple;

extra fine.

Diva (J. D. Stuart).—Pure white, small bloom, and entirely rayless; a charming flower of good form.

Duchess of Rothsay (Dobbie & Co.) .- A much improved Countess of Kintore, and very fine.

Duke of Clarence (Irvine). - Rich black with deep blue blotches; a very handsome and distinct variety.

Erin (J. D. Stuart).—A rich coloured striped flower; fine.

George Lord (Steel).—Sulphur yellow, with a deep orange central blotch; a very fine rayless variety.

Hibernia (J. D. Stuart).—Rich purple striped, distinct and fine.

Jane Bell (Irvine).—Heliotrope clouded with mauve, fine and

Lady Borthwick (Irvine).—A charming variety, and distinct.

Lady Dufferin (J. D. Stuart).—White, marked with pale mauve or heliotrope; distinct and fine.

Lillie Langtry (Dobbie & Co.).—A fine and rich coloured striped variety of good substance and form.

Lovelight (J. D. Stuart).—White, with a distinct Picotee margin of blue lilac, and very pretty and distinct.

Maggie Todd (Irvine).-Rich violet clouded with purple, lighter

coloured top petals; a handsome variety.

Mahogany (Smellie).—Bronzy crimson veined with lemon; bright and fine, and very distinct.

Mary Stuart (J. D. Stuart).-White, a little tinted with cream: an extra fine, quite rayless, variety of good form.

Miss Emily Reuk (J. D. Stuart).—A bright carnation-striped flower;

distinct and fine. Mrs. Joseph Chamberlain (J. D. Stuart).—Rose clouded with lilac;

a distinct variety. Mrs. C. Kay (Dobbie & Co.).—Raised by Mr. C. Kay of Gargunnock. White bordered with heliotrope; a distinct and pretty variety.

Mrs. Joseph A. Olliver (Irvine).—A very fine variety.
Mrs. Scott (Steel).—White, with a yellow blotch below the eye, and quite rayless and of excellent form.

Pride of Etal (Steel).—White, bordered with pale lilac, retaining the "Violetta" style of flower; a bright, distinct, good variety.

Prince of Orange (Dobbie & Co.).—A rich, deep golden yellow self; a decided acquisition in every way, and reported to be a good bedding

Venus (Steel).—Creamy yellow of "Sylvia" type.

William Dean (Irvine).—A grand flower, of fine form and substance, very rich black violet, blotched and clouded with pale blue.

William Jones (Irvine).—A Countess of Kintore style of flower, but

smaller and of exquisite form.

I have also seen other finc varieties raised by different growers, but as I have no knowledge of an intention to introduce them until the autumn of 1894 or spring of 1895, there is no necessity for alluding further to them now. There are likewise many other varieties which are being introduced for the first time by Messrs. Dobbie, Irvine, Pye, and others which I have not seen, and therefore they are not mentioned here.

It will be noticed, as before mentioned, that many of these new varieties have been raised by Mr. J. D. Stuart and Mr. McKee, both of whom often send me blooms of their seedlings, and both are on the right track in raising some very fine varieties, and they pass into other hands for distribution. I am unable to allude to Mr. McKee's new varieties, as their distribution is so uncertain, but I think Mr. Irvine will be offering some of them, and I can safely say that his Tara, The Clown, Decorator, Spray, and Charm will be acquisitions. Mr. McKee's Countess, Duchess, and Magnet (the latter especially, and already in cultivation) gave him fame as a raiser. Mr. J. D. Stuart has been most successful, and at the great Pansy shows of the midlands has making a many good goodlings contificates were granted to some of exhibited so many good seedlings, certificates were granted to some of them, only real merit being recognised. Messrs. Dobbie also have other new varieties, but I have not seen them.-W. D.

IT will be clearly noted by those persons who read the notes on recently introduced varieties by your correspondent "W.D." (page 438) we have now arrived at a period when these plants are very popular. I cannot speak as an old cultivator myself, but I certainly do grow the majority of the catalogue varieties, both new and old. My object in sending these notes is to protest mildly against the constant influx of so called novelties. A glance at the list furnished by your correspondent will suffice to show the practical growers that, at least, half of the varieties should never have been brought before the public. It would, of course, be very unwise on my part to particularise, but I know at the present time many of the varieties introduced three years ago are now discarded from some collections. I would not have my name associated with a Viola I knew would be ultimately discarded; neither would I as a trade grower introduce a worthless variety. The time will come when our Viola specialists will have to exercise the same discretion as the rosarians do at the present time.

Viola growers are now sacrificing everything for large flowers, losing sight entirely of the habit of the plant, a point, I take it, as of equal importance to the flowers. What is the use of a Viola plant that will grow a foot or more in an upright direction like a Pansy? yet how many of our modern varieties come under this head. Exhibitors to

some extent are responsible for the introduction of these unsightly growing varieties; so long as the flower is large and distinct, it would appear they do not mind any other defect. I saw several of our new varieties last season that were more than a foot high tied to stakes, and this in a dry season. While the exhibitors make size the principal point in their flowers, or appear to do so, we shall continue to receive the annual quota of these "leggy" varieties. We have many dwarf forms to work upon, and I think we should do well to discard this class of leggy plants which is now in the ascendant. The Ardwell Gem family of Goldfinch, Duchess of Fife, and White Duchess, are all models as far as habit is concerned, the foliage being on the surface of the ground, forming a pretty carpet.

We want the hybridiser to persuade the blooms of the tufted plants to look up. Dr. Stuart of Chirnside appears to be on the right track, for his Sylvia, a creamy white with good habit, possesses nearly all the characteristics that go to make up a fine Viola. Blush Queen, by the same raiser, is of good quality, while the Violetta type certainly opens up a new field for Viola raisers. The foliage and habit are all that can be a new field for Viola raisers. The foliage and habit are all that can be desired, now we want larger flowers, to make almost an ideal Viola, with a tendency to early flowering added thereto. I should like other Viola growers to give us their opinion on this most important matter, for I think it only wants pointing out to start the raisers of new varieties

on a different track.—J. B. R.

BURNSIDE'S BIJOU ON TEA ROSES.

IF there be any royal road to a knowledge of Rose culture it has certainly been discovered by the Rev. F. R. Burnside, Birch Vicarage, near Hereford. It is an age of expansion in literature, but it is also one of precis, compendiums, and compression. Even the English literary sentence has shrunk from fifty words in the Carolian era to twenty-five in the Victorian. Those who love to meander through the reams of text that are printed in gardening papers upon Rose cultivation will not get much of this linked sweetness long drawn out in Mr. Burnside's work on "Tea Roses: How to Grow and Exhibit Them." He very soon comes to the point. He has accomplished a feat which, so far as we know, is unparalleled. He has compressed all he considers necessary to be known on the cultivation of Tea Roses, on which he is an admitted authority, in the space equal to about a page and half of the Rose matter in our columns, the remaining pages, one-third of the book, being devoted to a good descriptive list of varieties. Mr. Burnside's Bijou is published by Messrs. Jakeman & Carver, Hereford, and Simpkin, Marshall, Hamilton, Kent & Co., London.

ROSES COMTE ALPHONSE DE SERENYE AND COMTESSE DE SERENYE.

THE above have been confused in more than one instance by friends of mine, and it may be well to note their great dissimilarity. Comte A. de Serenye was introduced by Louvais in 1866, and is now almost extinct in this country. No nurserymen's list that I have contains it. The shape is good, but the flower is small; colour bright clear rose, with a tinge of lilac and purple. It flowers very early, and almost always produces a fair bloom in the autumn from the point of late growths. At one time it was a great favourite with me, and is still

most distinct from any others.

Soon after Comtesse de Serenye came out, in 1875 (Lacharme), I had an instance of its confusion with the older Rose, and this by a trade grower, who said he had had it for years. He had mistaken the name. Lacharme's Rose is very double, and a bad opener during any but a dry and cool season. I did not get a bloom in 1893. The colour is a light rosy-peach, petals thin in texture, and very numerous, easily spoilt by wet, but a magnificent Rose occasionally. The shape of these two is different; so, too, are the growth and foliage, while in colour they are most distinct. I cannot help thinking a little more care in avoiding names too suggestive of other varieties might be an advantage. We have Duke and Duchess, Comte and Comtesse in so many varieties, to say nothing of La France and La France of 1889, advantage. that one not thoroughly conversant with Roses, or exceedingly careful about names, is apt to confuse them at times. There is a Comte de Paris in Hybrid Perpetuals and again in the Teas, and a Comtesse de Paris also in the former class.—PRACTICE.

THE WINTER PROTECTION OF ROSES.

THERE is an old saying in regard to the cooking of hares, viz, "first catch your hare, &c." "W. R. Raillem's" note (page 540) in reply to "A Lover of Roses" (page 510), rather reminds me of this old saw, as his advice in regard to mulching Rose plants with leaves would be a troublesome matter to such of us as live in big towns or on the borders During and since the recent stormy weather I think I could more easily have collected a good mulching of the debris from roofs, in the shape of broken slates, than an equivalent amount of fallen leaves. Nevertheless, I quite agree with "W. R. Raillem" that if you can get an ample supply of leaves and then have sufficient persuasive power over

these erratic particles of vegetable matter to induce them to remain quiescent, there can be nothing better or more satisfactory.

But, unfortunately, both I and many others do not live in or near sylvan glades, where there are more than enough for everyone of the fallen leaves of autumn, so we must adopt some other plan to circumvent the machinations of Jack Frost, and, faute de mieux, we must adopt what is really the only other effectual mulch, i.e., either earthing up or the use of long or short manure.

I do not think it is absolutely necessary to dig in this mulching after its primary use is over, nor do I adopt or advise so violent a method with the risk to roots involved therein, but in the spring I spread out the manurial covering over a larger surface than that on which it has rested in winter, and later on, during the early summer months, this mulch gets gradually absorbed and amalgamated with the soil in the process of gently hoeing or forking over of the surface.

I know some advise the complete removal of the winter mulch and the use of strong manurial water as a stimulant, but I adopt the plan I mention, although I also give artificial watering and help the Rose roots with concentrated manurial stimulants applied to the surface.

I believe that on the question of watering I am not in agreement with "W. R. Raillem," but here again I can claim there is good reason on my side; it is an absolute necessity for me to water, as if I did not clean my trees by artificial watering the foliage would get clogged and suffer from the impurities which are inseparable from the atmosphere of a town so large as Croydon.—CHARLES J. GRAHAME, Croydon.

HAVING tried "J. A. W.'s" (page 539) suggestion of burnt refuse as a protection for Teas I can thoroughly endorse all he says, and I think it is improved if mixed with road scrapings. I adopt three kinds of protection in the autumn for established dwarf plants. With the very tender sorts I put three or four spadefuls of soil in the centre of the plants; with those of a more robust nature I hoe the bed roughly, and gather a few inches of soil round the stem; and with the very hardy Teas I hoe the ground, but do not stop here, as over all I place a protection of long manure. My plan is to put the manure on fairly thick, and to occasionally lightly fork the top, and so keep it as dry and sweet as possible, the nutriment being washed down by rain and snow to the surface of the soil. Then in the spring I take off about two-thirds, and fork in the remaining manure lightly.

"W. R. Raillem's" remarks are always valuable, but I think he

"W. R. Raillem's" remarks are always valuable, but I think he under-estimates the value of manure so applied as instanced in his reply (page 540), to "A Lover of Roses" on page 510. My experience is that a winter top-dressing of manure can and does act both as food and protection; also as the manure is not then too fresh I do not see how it can injure the roots, and the slight forking can surely do very little harm to the surface roots. In fact experience has convinced me that the more the surface is lightly disturbed the more the thread-like roots seem to grow and revel in the liquid manure and mulching which

they receive when the buds are forming.

Is "W. R. Raillem" really serious when he advocates a covering of leaves? If so how many feet in thickness should they be put on, as dry leaves have a habit of blowing away, and how would he overcome this difficulty? I very much doubt whether leaves would act as a suitable protection, as they hold the moisture and tend to make the ground sodden and sour when put on in a dry state. I wish my leaves would all fall in a fortnight, but having Limes, Chestnuts, Elms, Oaks, Beech, and other trees, I think in my case it would be nearer the mark if I sail two months.—R. M. D.

MANURING AND TRANSPLANTING ROSES.

I HAVE read both of the interesting notes upon pages 510 and 540 touching on this question. I cannot say that I entirely agree with either; but "W. R. Raillem's" remarks against the use of short manure as a winter mulch I can endorse from many years' experience. We all endeavour to avoid surplus moisture at the roots of Roses during the winter; why, then, place short manure around the most vital portion of our plants? Few materials will retain the wet more than the thoroughly decayed manure so frequently recommended as a mulch, and we should bear in mind that frost is doubly injurious when combined with wet; yet many still advocate a saturated substance as a winter protection. "W. R. Raillem" does well to call attention to the little use of forking-in an exhausted dressing during the spring, it being of small service except the ground be naturally heavy and with the object of lightening it.

I would also like to know in what way the juices washed into the soil by rain can benefit Roses while at rest. We should not think of following this plan with pot Roses; always affording stimulants while growth is being made, and the plant is in need of it. Winter manuring seems to me a great mistake. In the first place much of the juices are absolutely wasted, while all of the benefit derived from the rising ammonia is lost. By allowing the air and frost greater action upon the soil, and then mulching and forking in the manure carefully during spring, I am convinced that the same amount of labour and stimulants may be applied to fuller advantage. Wet manure is no protection to the base of a Rose. It is not needed excepting during severe weather, and at these times the whole body of the manure is frozen. The "long" or strawy manure is liable to be no more or less than a sodden mass in a very few days after application. It also blows away, and makes the whole place untidy if dry; and this at the very time when its presence is most needed. A quiet frost does little harm compared to the same when accompanied by keen, frost-laden winds. These

search the whole wood, and are particularly trying, and they demand a great deal of sap from the roots if the wood is to be kept plump. In proof of this, note how quickly unestablished plants shrivel during their prevalence. My observations have given me the impression-that severe frosts, with a quiet or still atmosphere, do little harm provided the plants surrounding are not wet, This, and the waste already pointed out, has caused me to cease mulching with decayed manure during the winter.

A little of the ordinary soil drawn around the base of dwarfs, and a few branches of Birch, Spruce, or Gorsc fixed in the soil around the more tender varieties is far more rational. As "W. R. Raillem" points out, the roots are already protected by the soil, and the wood is the chief part to shelter. The amount of wind and frost which a few branches will keep off is scarcely credible by those who have not tried this plan. They are so easily applied and removed, and they answer their purpose when most wanted, not being found yards away, brought up by the first impediment to their flight before the very trost-laden

wind we wished to protect the Roses from.

I have seen Roses wrapped up with fern and litter as carefully as if they were some occupant of the sub-tropical garden; far more protected than the same person's Myrtles and Magnolias. This is unnecessary, as well as being harmful. The wild Roses are among our hardiest shrubs, and none of our garden varieties need more than the severe brunt of a sharp winter turned from them. When over-protected the wood cannot be exposed to sharp spring frosts with impunity, while if covered too long we get premature growth of no value whatever; in fact, only a severe drain upon the plants. My plan of placing a few boughs among them admits air and light freely, while acting as sufficient break to severely keen winds.—PRACTICE.

WINNERS WITH SEVENTY-TWO ROSES.

WE regret having to trouble you again, but as you will perceive from our last letter, we merely wished to correct a mistake on page 494 in "D, Deal's," remarks, where he distinctly states that Messrs. Harkness and Sons carried off every first prize for "seventy-two's" in the kingdom. Messrs. Harkness, in replying to our letter, state on page 540 that the prize offered at Tibshelf was for fifty varieties. Now the wording of the schedule is as follows, viz., "Roses, seventy-two blooms, fifty distinct varieties;" whilst the wording of the Elland schedule is, v z., "Seventy-two Roses, twenty-four or more varieties." We herewith enclose the two schedules referred to, and whatever Messrs. Harkness make of it, we still maintain and claim these prizes to be two of the "seventy-two's" in the kingdom, and the Tibshelf "seventy-two" was the best and keenest contested of the season.

We cannot perceive where Messrs. Harkness' seven firsts come in in competition with us, and we still maintain having sixteen firsts to their two. If they had more firsts, then they were in class in which we did not compete. We trust this will now be sufficient to show that we won at least two of the seventy-two's in the kingdom, and the only two for which we competed.—James Cocker & Sons.

[Our correspondents have quoted correctly from the Tioshelf and Elland schedules referred to. We have returned them to Aberdeen.]

HYBRID TEAS.

THE report of the Committee of the National Rose Society says of the new catalogue that it appears to have been much appreciated, and that several foreign trade growers have already followed the Society's lead in introducing into their own catalogues a separate section for Hybrid Teas upon similar lines to that adopted in the Society's catalogue. As a member of the Catalogue Sub-Committee I might be reasonably supposed to be in thorough accord with the new classification adopted, or at all events to have nothing to say against it; but, unfortunately, I do not think the arrangement satisfactory. I said at first I did not think I could attend the meetings of the Catalogue Committee; and, in fact, I was not present at any of them. Undoubtedly I was in fault, in that I ought to have declined altogether, or resigned later. Mr. Mawley was also so extremely courteous as to send me a proof of the matters decided on, so that I could give my opinions, and they were, I am told, duly laid before the Committee. Under these circumstances I am either an outsider who has a right to criticise, or in the position of a judge who is in a minority on the Bench, and who in such cases has the right of stating his own opinion, wherein he differs from his colleagues. I have also the assent of the Secretaries of the N.R.S. to my stating my views on the matter, it being understood that I wish to be quite loyal to the decision of the majority, and to be fair and accurate in every way. I think the catalogue is, and always has been, open to criticism on other points, but I will confine myself here to the classification question. The Committee seem to have made a change on an opposite principle to that which prevails in another part of the catalogue. On the one hand they retain the placing together of Teas and Noisettes in one class, and on the other they separate Hybrid Perpetuals and Hybrid Teas into two. This

other they separate Hydrid Perpetuals and Hydrid Teas into two. This seems to me inconsistent, and acting without principle.

It appears to me to be impossible to classify by drawing lines of demarcation without definitions. What is a Hydrid Perpetual, a Hydrid Tea, a Tea, or a Noisette? At least, as H.T.'s are now set up in a separate division, it may be asked, What is a Hydrid Tea? Is it the first cross only between a true Tea and a Hydrid Perpetual? If so, can it be proved that La France and Captain Christy are such first crosses? or is it any cross? If so, why are not Margaret Dickson (which through Lady Mary Fitzwilliam is a quarter Tea), Her Majesty (which is even said to be a first cross), and others, classified as Hydrid

Again, if La France and Captain Christy are to be considered Teas? H.T.'s, why stop there? Does not the whole of the Victor Verdier race

show the cross as much as Captain Christy?

Once more, if we take certain from the H.P.'s strongly suspected of being H.T.'s, should we not do the same with the Teas? Will anyone deny that there is as much cross in Gloire de Dijon to separate it from the true Teas, as there is in Grace Darling to separate it from the H.P.'s? To take such well-known Roses as La France and Captain Christy from the H.P.'s, where they have been sollong, was a strong step; not necessarily wrong in itself, but I think that definitions should have preceded it, and that future results should have been considered. must be prepared, now hybridising is so much in vogue, for a H.T. to be crossed back with the Teas, and its produce back into the H.P.'s, and so on backwards and forwards till, as the coachman said of the railway accident, "Where are you?"

For these reasons, which I have made as brief as possible, for there is a good deal to be said on the matter, I think the new classification of Hybrid Teas to be unsatisfactory, and unlikely to be permanent.-

W. R. RAILLEM.

A RECENT SLANDER.

HAVING been referred to on the subject, I should like, with your permission, to write a few lines relating to an important personal matter mentioned by Mr. Frank Cant at the annual meeting of the N.R.S. The subject is mentioned in the admirable report of the Society's meeting published by you on pages 540, 541, but some other remarks made at the time in connection therewith are omitted. Mr. Frank Cant stated at the meeting that there had been unfounded reports in circulation for some time past in regard to his supposed aiding at Rose Shows his intimate friend and neighbour, Mr. O. G. Orpen of Colchester, and Mr. Cant said he wished to give a most unqualified public contradiction to this slander.

I suppose that jealousy will at times make people blind to the merit apparent to others, and we are aware, as Mr. Cant said, that when mud is thrown some of it will stick. Other slanders have also been in circulation, and it was time that they should all be brought to an end. A matter of this kind may be more serious in its consequences to a professional rosarian than to an amateur; but everyone values his good name, and we can all understand the annoyance given to both the

gentlemen interested in this particular matter.

Mr. Frank Cant, as a rosarian, stands second to no one in the kingdom. Mr. Orpen is less known except to those of us who are exhibitors. We who know both gentlemen personally have not given much heed or attached importance to the reports in circulation, and I may say that although, probably. I have run second more frequently than anyone else of late to Mr. Orpen's first (being truly a "Ravensbury" to his "Isinglass" in five recent Rose contests), I have never attached the slightest importance to the depreciatory and untrue remarks made about him, as I have always felt confident that he won by sheer merit, and deserved his success.

In the cultivation of Tea Roses Mr. Orpen has almost discovered the philosopher's stone of Rose growing. I look to his being one of our amateur champions in the near future, and he will be a worthy one. "Honi soit qui mal y pense."—CHARLES J. GRAHAME, Croydon.

GARDENERS AND GARDENING.

[Read by Mr. J. DAVIES before the Chislehurst and District Gardeners' Mutual Improvement Association.

GARDENING is one of those arts which enables us to make the most of Nature's gifts. It has been said over and over again, He that makes two ears of corn grow where only one used to grow, is a public benefactor; in other words, whosoever can increase the produce of the land does a real service to the country. Gardening, however, takes a higher stand; its object is not only to increase, but to improve the produce. It is for the gardener to learn from Nature what a plant requires, and to afford that in proper quantities, and if the soil does not contain its proper requirements, it is for the gardener to step in and supply the want. It is well understood that what succeeds in one place may be a complete failure a few miles away. Sometimes in the adjoining garden crops that succeed with your neighbour may be a complete failure with you, so different may be the aspect and soil, and so this is one of the many reasons why gardening is never learn.

Study your employer's interest in commencing your duties as gardener, endeavour to find out the requirements and tastes of your employers as soon as possible, and having done so, lose no time in carrying those wishes out, for it must be remembered that it is they who find the sinews of war. It often happens that a gardener has some special favourite flower of his own; it may be the herbaceous Calceolaria or Cape Pelargonium, or perhaps Chrysanthemum on the large flower system in preference to the smaller, and to most minds more useful blooms. Be that as it may, endeavour to fall in with the new order of reasonable employed, and if found that tastes and temperament are at variance with each other, it is better to seek "fields afresh and pastures new."

Interchange of friendship and paying visits to other gardeners is of the utmost benefit, independent of the pleasure socially. always something worth taking note of to an observant man, however small the garden might be. This reminds me how often one is struck with the fact that in small gardens, with perhaps only one or two glass

houses, that much is done with very limited means; on the other hand, many men who are thoroughly practical and produce fine examples of their work as long as ever convenience is at hand, and have an unlimited purse at command, are altogether at sea when they have to manage a garden under difficulties and on strictly economical lines.

Hybridising and making experiments are interesting, but however laudable this branch of gardening may be it has its drawbacks. Many employers have a wholesome dread of experimental gardeners as being the most expensive, and are often paid high wages for simply amusing themselves. There are many theorists who lecture here, and write there, and talk everywhere; but if you visit their places, to say the least, you would feel disappointed. I am, though, willing to admit that there are men who write for the press continually who are thoroughly practical in every branch of their profession. Hybridising and experiments in my opinion are better suited to the well-to-do nurseryman and affluent amateur, for in many cases it is not a very profitable occupation, however interesting it might be. An old friend of mine annually produced a great number of seedlings of Zonal Pelargoniums, hoping by a systematic fertilisation to have a blue flowered variety. I used to visit him pretty frequently, and he always fancied he was getting nearer his ambition; but to this day, now some twenty years, I do not think he has succeeded. Fortunately for him he had a very indulgent employer, and one who to a certain extent encouraged him in his hobby, though his garden suffered terribly through lack of attention. I rather like a man with a hobby; he is a very interesting individual, but do not ride your hobby too hard, or disastrous results will probably accrue.

No doubt many gardeners will remember the late Mr. Mechie of Tiptree Hall, Essex, and London some twenty or thirty years ago-with what spirit and energy he entered on the task of converting a rather barren spot into a model and fertile farm; true, it had some natural advantages in climate and aspect. I am now writing from memory altogether, so am open to correction. He was considered to be a great Everything that Mr. Mechie did was taken note of and reported in various papers, and was thought to be a great success; but notwithstanding that he had a splendid London business to feed these experiments they were not a success. Then Mr. Peter MacKinley some twenty-five years ago gave us such interesting reports in a tabulated form as the results of his experiments with various kinds of Potatoes. These were carried on for several years, but became very expensive. Most of you will remember the late Mr. Clarke, of Magnum Bonum Potato fame. He, too, spent the greater part of life in raising new varieties of Potatoes, but died by no means a rich man. Mr. Laxton, who worked most perseveringly for years in producing new varieties of Strawberries and other things, did not make a fortune. I mention these facts to show how much we owe to these men, who spent whole lives in their endeavours to benefit the world at large. I think such sacrifices as these should be recognised in some substantial way.

Exhibiting is the ambition of many gardeners, and a very laudable one too. It has been said, however, that the best exhibition board is your employer's table. Be that as it may, be quite sure that its owner is with you in your desire to show, then all will be well, for it entails much expense in labour and materials, and unless this is well thought out before it will rather surprise you when bringing it into practice. Then there is the thought sometimes that everything is neglected for the plants you are going to exhibit. Watch very carefully your employer's inclination. Directly you see he shows signs of being tired of the business, fall in with his views, then all will be well; but if you continue your hobby trouble will follow most assuredly.

Order is one of Nature's first laws. It is wonderful how much can be done by a proper system of working. One man in commencing some work will scatter his tools and material everywhere. The work will be begun at all points and finished nowhere. Another man will well consider where the work should be commenced and where it ought to be finished, endeavouring all the time to keep it completed as close up as possible, so that whatever occurs the work is practically finished as far as you go. I fancy I hear someone saying, "It's all very well to talk, much easier than doing." That might be so, but it is surprising what can be done by keeping these ideas before you. It is a good maxim. If you have anything in particular to do measure the time it will take, and if you think it can be done in one day try and do it; if it will take a week endeavour to do it in that time, and if a month the same; it gives a sort of stimulus to the work.

The rubbish heap is a necessity in every place, and often consists of stones, weeds, leaves, pruning of trees, pot plants that are no longer required, sweepings of paths, and so on, all in one confused mass. I remember one gentleman remarking that there was no reason why a rubbish heap should not look tidy. I think this is worth remembering. It is a good plan to keep everything that will burn apart from rubbish which will not; also put stones by themselves for making roads or paths. I have often seen what trouble there has been when mixed together; the attempts to burn or separate this mass, finally, perhaps, disposing of them by trenching a piece of ground and so burying the whole, to be turned up again at some future time.

In concluding this paper on "Gardeners and Gardening," I urge all young men to make the most of their time at their disposal, for assuredly much more will be required of them in the future than in the past. There are many advantages now which did not exist a few years ago, and if gardeners do not embrace these opportunities they will have much cause to regret it. Mr. Stanford said, "In the young man; firstly, be industrious; secondly, have a settled plan; thirdly, be everlastingly persistent in both. These, applied to fair ability, will win."

NATIONAL CHRYSANTHEMUM SOCIETY.

THE last of the Floral Committee meetings for the present season was held on Wednesday, the 13th inst., at the Royal Aquarium, when Mr. C. Harman Payne presided. The exhibits were bright, in good condition, and numerous, considering the lateness of the meeting, which was rendered attractive by a large contribution of cut Chrysanthemums from Mr. R. Owen, to whom a silver medal was awarded for his collection. Secretary Farson, a large incurved Japanese, a deep globular flower of a dull rosy bronze, was commended. John Noble, another of the same type, colour carmine crimson, with a paler reverse, tipped yellow, the Committee wished to see again, together with W. G. Newitt, a white Japanese, with long drooping florers flushed yellow in the centre. An ingenious expanding show-board was exhibited by Mr. C. E. Shea; it is made in sections, each of which can be moved in any direction, so that the board can be used for staging incurved as well as the largest of Japanese. The Committee highly commended the exhibit, as it would apply a shibitors to use their granted that it would be a shibitors to use their granted that it is not the same than enable exhibitors to use their present show-travelling boxes.

First-class certificates were awarded as under :-

Owen Thomas .- A Japanese incurved of large build. The florets

owen Thomas.—A Japanese incurved of large build. The florets are of medium width, curly at the tips, and of a bright, clear canary yellow. One of Mr. Owen's seedlings, who was the exhibitor.

Good Gracious.—A Japanese, with tubulated florets of remarkable length. They are curly, twisted, and intermingled, forming a globular and apparently solid bloom. Upon close inspection, and without support, the flower falls open rather loosely. Its colour is blush pink, passing to white in the centre. An American seedling shown by passing to white in the centre. An American seedling shown by

Mr. Owen.

At the close of the meeting Mr. Kendall called attention to a bloom of Henry Perkins, which some time since was certificated as an incurved Chrysanthemum. It was resolved that it be transferred to the section of Japanese incurves in the official catalogue of the N.C.S. At the close of the meeting the Chairman, in the name of the General Committee, thanked the members for their attendance during the season, and hoped that the meetings for 1894 would be as interesting in every way as those this season, which he ventured to think would be the case, considering the remarkable progress the flower had made during the past few seasons.

NEW CHRYSANTHEMUM EVA KNOWLES.

Mr. Knowles of Headlands, Pontefract, is the fortunate raiser (from American seed) of a grand new Japanese variety. It is a sturdy grower, and the blooms were good both from crown and terminal buds. In colour it is crimson carmine, in size equal to Viviand Morel, in growth as good as Etoile de Lyon.-W. S.

ROOTING CHRYSANTHEMUM CUTTINGS.

A WELL-KNOWN grower referring to best method of securing a good strike of cuttings said that it was better to place several into a 5-inch pot than to put them singly into small pots, as in the latter case the soil will become somewhat soured through frequent waterings ere the roots were fully formed. I called upon a gardener the other day who said that suggestion was no doubt good when the pots were stood on stages or shelves in houses where, of course, the soil would soon dry, and need frequent waterings. "I, however," said he, "root mine in small pots singly, and stand them in a close frame on an ash floor, where from the time of putting in after once watering, and give them only light sprinklings with the best results." I saw his cuttings so rooted, and they were looking all that could be desired .- A.

INCURVED JAPANESE CHRYSANTHEMUMS.

\$1 WISH to correct the error I made on page 497 by stating that Leon Frache and Mdlle. Marie Hoste were in the first prize stand at the Reading Chrysanthemum Show. I should have said that the varieties mentioned were in one of the prizewinning stands.—BEGINNER.

BEING one of the judges at the Reading Chrysanthemum Show, I have been somewhat interested in the discussion on the above question in the Journal. I cannot understand "Beginner" (page 497) accusing the winer of the first prize exhibiting unfairly. I am glad to notice Mr. Lane (page 537), the winner of the prize, offering to give the names of the twelve varieties he exhibited. Though by mistake he mentioned Gaspard Rozain for Leon Frache, I have since had his word he staged neither variety. I consider this class should be revised before another season. With so many varieties now before the public there should be no doubt, either to exhibitors or judges, what constitutes a Japanese incurved. For example, why should Boule d'Or be allowed in that class? In judging at a show this season, where it was largely exhibited as a Japanese incurved, I could hardly bring myself to be ieve it would be found in the National catalogue classed as such.—EDWIN BECKETT.

[We have heard many expressions of surprise that Boule d'Or should be classed as an incurved in the Japanese section of the N.C.S. catalogue.]

NEW CHRYSANTHEMUMS.

I NOTICE that Mr. E. Molyneux, in his useful notice of new Chrysanthemums (page 514), refers to my seedling, Miss Dorothea Shea, as having been sent out last year. This is a slight error, for as a matter of fact, it was not sent out until the season 1893. Of course in a first season a variety does not, as a rule, appear in its best condition; it is, therefore, the more gratifying to me to learn that, in this, its first year, the variety in question furnished, in Mr. Molyneux's opinion, "the finest individual bloom" that he saw "this season in a rather extended tour."—C. E. SHEA.

THE "SHOESMITH" CUP AND TUBE

INVENTED by Mr. George Coppin of Croydon, and named in compliment to an excellent gardener and Chrysanthemum grower, this

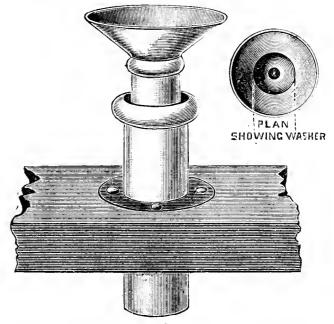

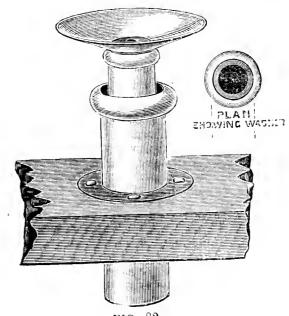

FIG. 81.

receptacle for blooms, including Roses and cut flowers generally, is as neat as it appears effective. The material is white pottery-ware, light Just within the cup is an indiarubber washer that grips the tube and holds it where wanted, high or low, as the case may be. There is also a washer in the neck of the tube that grips the stem of the bloom, holding it in position without the aid of pegs or wedges. From the cup and tube we tried there was no escape of water when held upside down. The washers may be expected to relax their grip in the course of time, but they must cost next to nothing, and can be inserted in a moment. The material is breakable under rough usage, the same as cups and saucers and flower pots, yet both have come into fashion and are

F1G. 82.

not likely to go out. It remains to be seen whether the "Shoesmith" cup and tube will become and remain a favourite with exhibitors of cut blooms. The appliance is ingenious, yet simple and worth trying. example shown in figure 81 is for incurved blooms, that in fig. 82 for Japanese. The invention is "protected."

HAIRY CHRYSANTHEMUMS.

I AM afraid your correspondent "P." (page 515) is not very favourably impressed with these Chrysanthemums. Many of us thought they would form a very valuable addition to our lists, but 1 fear the majority of growers, like myself, have been sorely disappointed. The advent of Mrs. Alpheus Hardy was hailed with delight, but very few exhibitors place any reliance on it. In Louis Boehmer we obtained a plant with a fine habit and good growth, but the less said about the colour the better, unless the plants are grown naturally; under such

culture the colour is far more attractive, and its floriferousness is remarkable. I regard it as one of the best Chrysanthemums we have for decorative purposes. Miss Annie Manda is said to be an improvement on Mrs. Alpheus Hardy. I ask where is the improvement? In W. A. Manda we certainly do get a good decided colour, but its hirsute character is not too strongly developed. It is an excellent decorative variety. H. Ballantine has nothing to recommend it, so far as I am capable of judging. Like your correspondent, I have grown White Plume during the past season, and am so favourably impressed with it I shall grow a larger number next season. It possesses the true Louis Boehmer habit and floriferousness, while the colour is pure white. I certainly think it will make a good decorative variety. Sautel 1893 is a variety of pleasing colour.—J. B. R.

CHRYSANTHEMUMS IN BASKETS.

At the late Windsor Show substantial prizes were offered by the Dowager Duchess of Sutherland for twelve blooms, any kind, arranged in a basket or vase, to be cut with a stem not less than 1 foot in length, retaining the foliage with the blooms. Seven competed, and a very effective display this class produced. Where the colour of the blooms, mostly Japanese, was chosen with a view of harmonising them with hardy foliage, such as Cryptomeria japonica, various forms of Spiræa, Mahonia, Bramble leaves, and such-like, the effect was pleasing. This appeared to me as being an excellent way of utilising these large blooms for decoration, and worthy of imitation.

CHRYSANTHEMUM MARS.

Anyone requiring a really good decorative variety should lose no time in adding this to their list. As exhibition blooms go nowadays, this Japanese is too small for the "boards." The best blooms are of medium size, very full in the centre, the florets are broad and flat. The colour is its great charm, being rich orange yellow, heavily suffused and spotted with chestnut bronze. The habit of growth is most desirable, being dwarf and carrying good foliage.

CHRYSANTHEMUM MRS. A. HARDY.

This variety seems to be a free seeding one, judging from the number of new sorts obtained from it in this way. Mr. Godfrey sends me a bloom cut from a seedling plant which exhibits a marked improvement upon its parent in the massiveness of its florets, which are of greater length, and possessing much more substance. The hirsute appendage, perhaps, is not quite so striking as it is in well-developed blooms of Mrs. A. Hardy, but the extra thick petals coupled with the purity of its colour is an equivalent to the loss of its hair-like addition.—E. M.

DAMP-RESISTING JAPANESE CHRYSANTHEMUMS.

MR. E. MOLYNEUX (pages 514 and 537) gives us such a good account of new varieties that I should be glad if he, or some of your correspondents with knowledge of the new varieties, would give a selection of varieties up to show size that are the best damp resisters. Many gardeners are expected to maintain a display in the conservatory, and whether a bloom will keep three days or three weeks is a matter of consequence to the grower. The following varieties are the best keepers in my collection:—Mons. Freeman (hest of all), Beauty of Castlewood, Mrs. Wheeler, E. Molyneux, Japonaise, J. Shrimpton, Lord Brooke, Princess Victoria, W. W. Coles, Mrs. C. Harman-Payne, Waban, and J. S. Dibbens.—F. GEESON.

HABITS OF CHRYSANTHEMUMS—A SUGGESTION.

It is now too late for the following suggestion to be carried out this season, but in good time for the consideration of nurserymen and others who may see fit to adopt it next autumn. It is this, namely, that if the character and habits of the different varieties of Chrysanthemums—the newer sorts, especially—were given, and less said about the splendid colours, which rarely appear in the blooms when they are open, it would be a step much valued by intending purchasers of plants and cuttings. When a grower advertises a certain variety for sale and states its price, it is presumed that the vendor or introducer has tried the plant first, and, consequently, has a fairly full knowledge of the peculiarities of it as regards growth. When customers at present buy a new sort they have to devote the first season to the work of finding out the proper way to grow it; but if a few hints only were given in the first place, a practical grower would be able to treat the variety with some assurance of success. I have seen many catalogues of Chrysanthemums, and take the following from one of them as being the nearest to what I mean.

"Mrs. C. Harman Payne (Jap. Inc.).—Rosy blush, of immense size and substance; one of the best of the present season's introductions. First-class certificate. Very vigorous grower, 10-inch pot, at least five shoots should be left on each plant, pot firm, use manure water sparingly.

Crown bud."

"President Borel (Ref. Jap.).—Brightest possible rose, pale golden centre. One of the handsomest and most welcome of the season, grand, vigorous grower, 8-inch pot, liberal supplies of manure water. Crown and terminal bud."

A grower cannot, with every variety, find out its proper treatment during one season, but the time is sufficient to prove whether the sort is very late, medium, or very early, and also whether it gives the best flower from the crown or terminal bud. I will not take up your space further than to say that if nurserymen gave some such description as the above with all new sorts which they offer as worthy of cultivation, they would earn the gratitude of hundreds of Chrysanthemum growers.

—G. GARNER.

FRENCH CHRYSANTHEMUMS.

EVER since I can remember the French raisers of new Chrysanthemums have been seriously taken to task for the large number of worthless varieties they have sent out, not perhaps without good reason at times; but, on the other hand, nobody can deny that many of our leading show varieties are of French origin, and still continue to occupy a most important position in the winning stands of the leading exhibitors at Many of us expected a few years ago that the new seedour shows. lings from America would in a short time eclipse the French ones, and that the latter would be practically excluded from our shows in future by the high quality of those from the States; but I cannot help thinking we are as yet a long way off such a consummation. It would perhaps take a very patient man to tabulate the lists of English, French, and American seedlings, so as to show precisely their relative value at say a dozen of our leading shows, and even if this were done I feel sure that the French seedlings would occupy anything but an unimportant position in such a compilation. In looking over the reports of a few of the early shows, it is most remarkable to find how many Japanese Chrysanthemums of French origin have been staged, and how frequently some of them, like Viviand Morel, Mdlle. Marie Hoste, and Etoile de Lyon, appear in all the shows.

I have had the curiosity to put down roughly the names of the French flowers reported to have been staged in two or three of the large classes at Liverpool, the Crystal Palace, the National, Kingston, and Brighton Shows only, with the result that twenty-three varieties are still considered worthy of finding a place on the show boards of those who may be considered leading exhibitors. As there are some people who fancy our French friends have almost reached the length of their tether, these names may be of interest to them, especially as the flowers are of modern date in several cases, and do not include sports which have been obtained from varieties received from the French. They are as follows:—Etoile de Lyon, Viviand Morel, Mrs. C. Harman Payne, Mdlle. Marie Hoste, Boule d'Or, M. Bernard, Bouquet des Dames, President Borel, Madame E. A. Carrière, Condor, Alberic Lunden, Pelican, Van der Heede, Madame J. Laing. Beauté Toulousaine, Mdlle. Thérèse Rey, V.P. Calvat, G. Daniels, V.P. Darquier, Marquis de Paris,

Val d'Andorre, Madame Baco, and Louise Leroy.

These may be all regarded as established varieties, and in the hands of the general public; but there are others in the hands of the trade which will be distributed next year, and consequently swell the list. Many of these novelties are distinctly promising, and although the French raisers, who have hitherto kept us well supplied, do not shine this year, there are one or two new ones who may take their place, and thus maintain the credit of their country for new Chrysanthemums. Of these I consider Mr. Ernest Calvat is destined to take the leading position as a raiser of new Japanese Chrysanthemums, for although he has only been engaged in the work for a period of three years there are more of his seedlings now in the English trade than most of us are aware of. Those which have been exhibited at the meetings of the Floral Committee or which have been seen in good form at the importers, are worth naming. It is unnecessary to attempt descriptions for the present purpose, as they can easily be had from the trade catalogues. They are Madame Calvat, Mdlle. Marie Recoura, Dr. Gaché, Exposition de Grenoble, L'Ami Etienne, Le Drac, L'Isère, Louise, Madame Ed. Rey, Madame Ch. Molin, Commandant Blusset, Madame Ad. Chatin, Madame Ch. Capitant, M. Aug. Perrin, Mdlle. M. Ricoud, Madame Zurick, of which there are sure to be some that will be seen in good form next season.—C. H. P.

DESSERT TABLE COMPETITIONS.

I AM pleased to find that in answer to my inquiry (page 519) as to the proper interpretation of the words of the schedule of prizes of the Hull Chrysanthemum Show, as it relates to the dessert table class, the answers of your numerous correspondents are so overwhelmingly in favour of the judges who made the award. Mr. W. Iggulden (page 532) describes my letter as a "queer nut to crack," but does he not also extract the kernel when, after supporting the judges, he says, "If I intended to compete for the prizes at Hull, I should certainly feel justified in using four good dishes of fruit, both because the wording admits of this being done, and more especially because I am certain that would gain me a few points with the judges?"

"A Yorkshire Bite" (page 532), however, attributes to me two quite

"A Yorkshire Bite" (page 532), however, attributes to me two quite opposite opinions, a ludicrous mistake which an ordinary careful reading of my letter would have saved him from. If I thought the first prize was "rightly awarded" I should scarcely be so foolish as to believe that "if a protest had been entered it would have been disqualified." I expressed no opinion, but stated the case from opposite points of view for the purpose of having openly settled a point which had been raised by numerous visitors to the show. The instructive and interesting replies of your able correspondents will, I think, dispel any misunderstanding that has arisen, and I hope help to secure a good competition next year.—EDW. HARLAND.

WHETHER the adjudicators at the Hull Show were right or wrong in their interpretation of the conditions which guided them in the awarding of the prizes in the dessert-table decoration competition is not a matter which I wish to enter into. I have pondered over the views given as to what is the difference between a "dessert table" and a "dinner table." Evidently "A. D." (page 531) thinks there is a difference. If he had much experience as a decorator in large establishments he would

think differently. The remarks of Mr. Iggulden I fully agree with, wherein he states that if his brother gardeners are well advised they will endeavour, to the best of their ability, to keep up the old custom

of placing some of their best fruit upon the table.

If the framers of the schedule at Hull did not intend dessert to be placed on the table, why was it described as "desscrt?" This latter word quite as much settles the business as "only" Chrysanthemums with any hardy foliage to be used in its decoration. If dessert was not placed, then there should have been spaces left for the number of dishes intended.

I am well aware it is a different matter to arrange a table at a show than at home, but at the same time these decorations are supposed to lead to ideas for home decoration, although it is rarely they can be so adapted. There is the silver to display, and which the majority of owners take a pride in, and the decorations have to be so arranged to fit in with this. The number of dishes of dessert are arranged according to the size of the table. "Yorkshire Bite" oversteps the bounds of argument entirely, wherein he asks "Was every exhibitor to load her table with all the known wines and cordials also all the home and her table with all the known wines and cordials, also all the home and foreign fruit, both fresh and dried, that our fruiterers could supply?" What a "bite" they would have! A table could be laid out "completely" with four dishes or six dishes of fruit, to be varied according to its size. A dessert table could be "completely" laid out with only preserved fruits, although the lady or the gentleman of the house, as the case may be, would think perhaps it would be a poor dessert to be placed before their guests, that is, if they had a garden where fruit was expected to be grown.—A DECORATOR.

AT page 519 of Journal of Horticulture for December 7th, Mr. Harland, one of the Hon. Secretaries to the Hull and East Riding Chrysanthemum Society, solicits the correct view of the following stipulation in the society's schedule, viz, "Dessert table 8 feet by 4 feet completely laid out for six persons, only Chrysanthemums with any kind of foliage to be used in its decoration."

Following Mr. Harland's request is the Editor's desire to publish the opinions of table decorators or show judges upon the subject, and having assisted in adjudicating on table decorations at shows, as well as a fairly large experience in that particular art of gardening, I venture an opinion as to the only construction it appears possible for either exhibitor or judge to put upon the wording of the schedule. The table of proper dimensions as required by the schedule is of necessity provided by the Society, the competitor being requested by strict stipulation to convert the same in a "dessert table" completely laid out, that is to say, everything that is necessary to a fully prepared dessert table, for six persons, must be placed upon it, the character of the dessert used resting entirely with the exhibitor.

That the Society attaches primary importance to a well prepared dessert table is evidenced by the words, "completely laid out," as mentioned by Mr. Harland, subordinating other adjuncts such as floral decorations, so that any deviation from the strict wording of the schedule must assuredly suffer disqualification in the event of a protest to that effect. The following would appear more practicable in such cases:—"The most tastefully decorated dinner table, laid out for six persons, only Chrysanthemums with any kind of foliage to be used in the decoration, dimensions of table 8 feet by 4 feet."-J. P. LEADBETTER,

The Gardons, Tranby Croft, Hull.

[Many persons who have had much experience in judging and the interpretation of ambiguous terms would in this case differentiate between "laying out" a table tastefully and artistically, and furnishing it with comestibles. The condition of "laying out" the table for six persons appears to have been complete in the number of necessary articles for use; the "placing on" the table of fruit and wine was not a specified condition. In cases of doubt in law "custom" becomes the determining factor, and it is undoubtedly the custom to specify that fruit and wine must be placed on a dessert table when that is the intention of show authorities.]

OSIERS.

(Concluded from page 542).

INSECT AND OTHER ENEMIES.

THE green fly, a species of aphis allied to the Pea aphis, does considerable damage to the Osier in certain seasons. If the plants are much affected the tender shoot at the top is killed and the growth is stunted, lateral shoots are thrown out, making the rods "snaggy," and

so injuring the sale. Some kinds are more affected than others.

The "black smother fly," another of the aphis family, in certain seasons also injures the rods in the same way as the green fly. The tops of the rods are completely covered with them, the growth of the Osiers is stopped and the crop injured. This aphis has a preference

for Glibskins, white new kinds, and all rods with a sweet skin.

The "scab" is a disease of the bark: the effects of an injury made by an insect in the early growth. The injury shows itself in the form of a scab or bad place in the rod, going through the bark and some way into the wood; at these places the rod will break when being peeled, or if left brown will break, when being worked, therefore if a crop is much affected it is a very great loss to the grower.

The larvæ of some moths and beetles, which are wood borers, are sometimes found in the heads and in the rods themselves when left for two-year-olds, viz., the goat moth, leopard moth, musk beetle, and the long-horned beetle. The larva of the goat moth, however, requires two or three years to mature, and the moth almost always chooses trees of larger growth.

A great enemy of the Osier is a small round beetle, the Willow beetle (Phratora vitellinæ), which bites the young rods close to the head so severely that they break down with their own weight and come to The beetle is rather more than a sixth of an inch in length. It is somewhat variable in colour, from blue to green, with metallic lustre, having faint spots upon the wing-cases. The body beneath is of a reddish hue, the antennæ are black. It is most tenacious of life, and difficult to kill with water and pungent and poisonous solutions and fumes. It comes forth in May from its winter retreats in the earth, in rubbish, under the bark of trees, in the chinks and crannies of buildings, posts, and rails. Fences, especially fences made of "brush" woven between stakes, form admirable shelters for it. In short, any refuge near the Willow beds seems to be suitable to keep the beetles from birds and from the weather, for they are not affected by cold. Having strong wings, they can fly considerable distances. The eggs are placed under the leaves in groups and without any regular arrangement. In ordinary circumstances the larvæ are found on the Willow plants towards the end of June. They are about half an inch long, dirty white in colour, with black heads and rows of black spots along their bodies; they have six feet. In this country, as in Germany, there are two attacks, one in the spring, and the other in September and October. To prevent the attacks of these beetles, flooding the Willow beds has been resorted to where this can be done artificially. Though they are difficult to drown, this tends to decrease them, or at least those below the water level. Many arc ensconced under the bark of trees, in posts, and hedges above the water mark. Flooding with sewage has been found to be far more effectual than flooling with water. As far as possible, rubbish, and any other possible refuges for the beetles, should be removed from the Willow beds and their neighbourhood. Many things have been tried to dislodge these insects, such as soot, sulphur, and other unpleasant materials. Those who have seen Willow plants growing luxuriantly in beds will appreciate the difficulties of applying insecticides or insectifuges either in dry or liquid form. Paris green and London purple have been experimented with and found of some benefit. These require to be applied early, upon the first appearance of the beetles and before the plants have made too much headway. Care must be taken not to make the arsenical washes too strong, as the Willow leaves are tender. Not more than 1 oz. to 20 gallons of water should be used at first. Some Willow-planters have taken to picking the beetles off by hand, and shaking them into vessels held beneath the plants; this operation is said to have been effectual in small plantations.

The larvæ of the eye hawk moth and the bufftip moth are found feeding upon the Osiers, and also those of the puss moth, but not in sufficient numbers to cause any real injury. The bufftips may perhaps in some localities do mischief, as they are numerous at times and strip

where they feed.

A fungoid growth of the Osier is a kind of rust, similar to the rust on Wheat. It comes off upon the clothes of persons moving amongst The growth of Osiers would be retarded if severely affected the Osiers. by rust.

Rabbits, when numerous, are very injurious, biting off the young shoots and injuring others. Hares are to some extent injurious in the same way, but not so much complaint is made about them as of rabbits. Water rats in some districts do a certain amount of damage by cutting a road through the young growth. Mice on fcn land injure the heads by biting them close to the ground, causing them to die.

PURPOSES TO WHICH OSIERS ARE APPLIED.

The following are the principal purposes to which Osicr rods are applied:

Agriculture.—Nearly 25 per cent. of the supply of Osiers is used for hand baskets for twitch and Potatoes, root and Potato skips, chaff skips, riddle and sieve bottoms, hampers, flats, peds and baskets for fruit, Potato hampers and sieves, and fowl baskets.

Manufactures and Trade.—About 40 per cent. of the supply of Osicrs is utilised in the manufacture of baskets used by cotton spinners, lace makers, hosiers, confectioners, wine and spirit merchants, brewers, carriage makers, fruiterers, gardeners, bakers, grocers, butchers, hawkers,

coal miners, and coal whippers.

Domestic Purposes.—About 10 per cent. of the Osier supply is used for clothes baskets, cradles, wicker chairs, market and other baskets,

and small fancy articles.

Post Office. The manufacture of baskets used to collect and carry letters in the office, and of parcel post hampers, absorbs about 7 per cent. of the supply of Osiers.

Railways. - Railway companies use about 10 per cent. of the supply

for luggage barrows, meat and other hampers.

The remaining 8 per cent. is used for herring peds, baskets for unloading herrings and other fish, smelt hampers, salmon baskets, anglers' hampers and baskets, creels, eel hives, and jugs.

In addition to the above summary of Mr. Little's report, it may be useful to direct attention to an article by Mr. W. J. Cochranc of Hetton-

le-Hole, Fence Houses, Durham, on the cultivation of Osiers as a profitable method of utilising boggy or marsh land, published in the Journal of the Highland and Agricultural Society of Scotland (5th Series, vol. v., 1893), from which the following remarks have been reproduced :-

Provided there is a constant supply of moisture, any soil is suited to the Willow, assuming, of course, that it be of such a nature as to supply the requisite amount of plant food; but the most favourable land is a drained bog, rich in "humus" or decayed vegetable matter, and situated in the vicinity of water, either in the form of dykes, ponds, or the sea.

All the varieties of Osier require a large amount of moisture as compared with ordinary farm crops. Stagnant swamps, however, are not suitable for Osier growing, and such spots would require draining, hut not to such an extent as to cause the land in a few years to become dry; for it must be remembered that it is just as unreasonable to expect a good bed of Osiers on a dry soil as on a too wet swamp. In the first case they soon dwindle down, become stunted in growth, and in a short time yield no return to the grower; whilst in the second case, if too much water be present, the frost and hoar-frost resulting therefrom tend to destroy not only the tops and young shoots but also the roots. The great objection to a too dry Osier hed is that during the spring the plants make too great a call upon the moisture existing in the soil, and thereby reduce it to such an extent as to cause a deficiency in the summer and a check to the growth of the trees.

If hasket work is the main use to which the Osiers are to he put, perhaps the test kind to grow is the common White Willow, Salix alba, which grows fast and attains a large size, yielding tannin and salicin, while, in addition to its utility for hasket making, its wood is suitable for wattles, fuel, and chip. The common Willow, Salix viminalis, is a very good Osier for general purposes, heing suited alike to rough and to delicate work; while a taller variety, the Long-leaved Willow, Salix triandra, growing to a height of 20 feet, is one of the most useful of all Willows. Amongst others, S. ruhra and S. laurina may he recommended. The Crackling Willow (S. fragilis) is rich in salicin, and at the same time yields a fair amount of very good timber.

The method by which Willow-growing is extended is by means of cuttings or slips, not less than 6 inches long, and having at least two healthy huds, taken from good strong plants before the sap has risen, that is, during the month of March for preference. Usually such cuttings may he obtained dressed ready for planting at the rate of about 10s. per 1000, but when they have not been previously prepared, it is necessary to make a clean cut with a sharp knife completely round, and immediately helow a hud, just as you would treat slips of Rose trees or other garden plants. All the huds and young shoots hut three should be carefully removed, one of them only will he required to grow, hut in every case three should he left, to allow for the possibility of any of them failing to produce a shoot.

The slips should be put into rows, singly, about 2 inches deep, and a few inches apart each way, and the soil should he very firmly trodden down against the stem. This is done as soon after the cuttings have heen taken as is practicable—i.e., in March. During the summer they will not require much attention heyond an occasional hoeing, except in very dry weather, when they will be greatly henefited by judicious

However the soil of the future plantation may have been occupied in previous years, it will be necessary to either plough it over and harrow it level, or dig it, which latter plan, if well executed, is the best, though it is the most expensive. If there has been a sward of grass or other herhage, it must be pared off and hurned, the resulting ashes being spread over the land. If it is considered that drainage is required, the tiles must not be placed less than 3 feet deep; in the majority of cases this will be unnecessary. If digging is practised, the land may be trenched into beds 6 to 20 feet broad, according to the size of Osier to be cultivated—cross furrows or narrow ditches heing formed to carry the surplus water. If the plough has been used, the trenching and hedding up should be done soon after the harrows have completed their work.

Transplanting should be left until the spring following the year in which the cuttings were planted, when it may he done without fear of injury. It is at this period that great care is needed to insure a successful hed or "holt," for it must be remembered that the plants have to remain here for the rest of their life, and no amount of trouble should be spared in their proper planting and establishment. Rows should be struck out 3 feet apart on the higher ground (a good distance between each water furrow heing about 10 feet), so that the rows will he at even distances throughout the plantation. The plants should be placed uniformly 1, 2, or 3 feet apart (for general purposes 2 feet is the best distance); the larger species require more room than this, but in some parts of England the smaller kinds of Osiers are planted 12 inches apart, the distance between the rows being only

Before the plants are finally placed in the ground the shoots which have formed from the extra buds may he cut off as close as possible to the stem, allowing two or three huds to remain for the next year's growth, hut all those shoots which would go below the ground must be entirely removed. A spadeful of earth should be put round the young tree, and firmly trodden down, so as to give it stability; finally, the land should be cleared up and thoroughly dressed for the ensuing

Flooding with sewage water, if skilfully and carefully practised, is a great boon to the Osier grower; hut unless the plants are growing in the immediate vicinity of some populous town or village this is impossible.

On sewage farms, the number of which is rapidly increasing, it has been the custom to grow grain and other crops, notably Cabhages; but the reluctance manifested among the inhabitants to vegetables grown with the aid of sewage is so great that consumers prefer to huy an inferior article from the market garden. To remedy this the attention

of the sanitary authorities has been directed to the growth of a morsuitable and as productive a crop to take the place of others which are no longer profitable; and in the industry of sewage-farming, Osiers now take a leading place on the list of products recommended to be grown.

FRUIT FORCING.

Peaches and Nectarines .- Earliest House .- When the flowers show colour cease syringing the trees, maintaining, however, moderate moisture in the house hy sprinkling the floors on bright days in the morning and in the early part of the afternoon. The temperature may be maintained at 50° to 55° by day, ventilating from the first degree upwards, and closing at the latter. Fifty degrees at night is admissible in mild weather, 40° to 45° from fire heat being more advantageous than a higher temperature. Directly the anthers show clear of the petals the temperature must be raised in the morning to 50°, and kept between that and 55° through the day, with ventilation, more or less, according to the state of the weather, allowing an advance to 60° or 65° from sun The principle is to get stout blossoms, sturdy stamens with bold pollen-laden anthers, and well-developed pistils; then resort to fertilisation on fine days after the house has been ventilated some little time. If the trees are in good condition, and they are brought into blossom under favourable circumstances, the pollen will be freely discharged, and when this is the case the set generally is a good one, even without artificial impregnation. It is desirable, however, to aid fertilisation by shaking the trellis daily, or brush the blossoms over with a plume of Pampas Grass, or a rabbit's tail mounted on a small stick.

Second Early House.—The trees to afford ripe fruit in May or early in June must be started without delay. Fire heat need only be employed to keep out frost at night, and to insure 50° hy day, ahove which ventilate freely. The main point is to bring the trees on slowly. The trees should be sprinkled on fine mornings and afternoons, but damping the house occasionally in dull weather will suffice, for a close moist atmosphere tends more to leaf growth than a sturdy blossom. Examine inside horders, and give, if necessary, a thorough supply of water slightly in advance of that of the house. Outside horders should he protected with leaves or litter, so as to prevent the soil becoming

Succession Houses .- Proceed with the pruning and dressing of the trees, thoroughly cleansing the house. Dryness at the roots will cause the huds to fall, so if there is any doubt give a thorough watering. It will not do any harm in properly drained borders. Keep the temperature as cool as possible to insure a long and complete season of rest for the trees.

Pines.—Preparations must now he made for producing ripe fruit in May and June. As Smooth-leaved Cayenne, Black Jamaica, and Charlotte Rothschild, which failed to show fruit in October and November, will not now throw up in time to ripen at the period named, attention must be directed to such varieties as Queen, Enville, and Providence. Choose at once those plants which have an enlarged base, with a tendency to open at the centre, indications of the fruit being shortly visible, and place them in a light house or pit, affording a hrisk bottom heat of 85° to 90°, a top heat of 60° to 70° at night, 70° to 75° by day, with 10° more when the external conditions are favourable. Maintain a genial atmosphere hy damping surfaces other than hot-water pipes on fine afternoons, and syringing the plants lightly once or twice a week. Examine the plants for watering once a week, pply it copiously when required, which will be about every ten days, using tepid water, with a little guano or some fertiliser in it.

Figs.—Early Forced Trees in Pots.— As mentioned in previous calendars early Figs are hest secured from trees in pots, Early Violet and St. John's ripening first, and are followed by White Marseilles and Brown Turkey. A slight warmth at the roots is highly beneficial, this being furnished by two-thirds leaves and one-third stable litter, standing the pots on 9-inch pedestals of loose bricks to prevent them settling, and bringing up the fermenting materials so as to maintain a temperature of 60° to 65° about the pots in the early stages. When the heat at the roots is 70° or more during the early part of the forcing process the growth is too rapid, and it may cause the first-crop fruit to fall at a later stage. Where the trees were started last month for affording fruit in April they will now be unfolding their leaves, and the temperature of the bed at the base of the pots may he 75°. The temperature of the house should also be increased gradually to 60° at night, 65° by day by artificial means in severe weather, 5° more in mild weather, 70° to 75° with sun heat and moderate ventilation, closing at 75°. Supply water to the roots as required in a tepid state. Syringe the house and trees in the morning and afternoon of fine days, damping the floors instead of syringing the trees in dull weather.

Cherry House. — To insure a supply of ripe Cherries from the middle of April onwards the house containing the trees employed for that purpose must now be closed. Be sparing of fire heat at the commencement, not employing it unless absolutely necessary to maintain the temperature at 40° at night, 40° to 45° by day, ventilating at 50°, and closing at that temperature. Syringe the trees early on fine afternoons, omitting it if there is danger of the buds not becoming dry before nightfall. The border will be sufficiently moist through the removal of the roof lights, water seldom being required under those circumstances until the fruit commences swelling. If not in a healthy state supply water to bring it into a thoroughly moist condition. If dry trees in pots will require repeated supplies of water to secure the thorough moistening of the soil to the base. In a light, airy, properly heated structure Cherries are readily forced when established in pots and grown under glass a year previous. Early Rivers, Black Tartarian, and Governor Wood are excellent varieties. Half-standards are the best for pots, or such length of stem as will give heads well up to the glass.

Cucumbers.—The weather has been favourable to Cucumber plants, there having been a fair amount of sunshine. Light is very important in the cultivation of the Cucumber in the winter, and now the days are so short keep the glass as clean as possible both inside and outside. Do not supply strong liquid manure too freely. It should be tepid, and is better varied than always the same. Top-dressings of sweet rich compost applied to the roots promo'e vigour, supplying a little at a time and often, always previously warmed and in a moist root-favouring condition. Do not overcrop the plants, and do not allow the fruit to hang too long. They keep fresh several days after being cut if the stems are inserted in saucers of water in moderate heat. Remove superfluous fruits and growths as they appear, and tie the shoots as necessary. Red spider and white fly are best subdued by painting the hot-water pipes lightly with a cream formed of flowers of sulphur and skim milk. It is also effectual against mildew. It is a good plan to sponge any infected leaves with a solution of softsoap on the first appearance of red spider, 2 ozs. to a gallon of water sufficing, and dust flowers of sulphur on any parts affected with mildew. Green or black aphides succumb to dusting with tobacco powder, or careful fumigation on a calm evening, repeating in the following morning early.

Where early Cucumbers or Melons are obtained from frames, and there are no other means of raising the plants, some fresh Oak or Beech leaves with one-third of stable litter ought now to be thrown together, and, if necessary, be moistened so as to induce fermentation. The heap should be turned when warmed through alike to sweeten, to bring all into a genial condition by turning the outside to the inside.

THE KITCHEN GARDEN.

Asparagus, Seakale, and Rhubarb.—Where a regular supply of Asparagus has to be kept up with the aid of mild hotbeds in pits or frames, fresh roots have to be lifted and introduced into this heat at least every three weeks, shorter intervals being desirable if the demand is heavy and the roots plentiful. Should we once more experience extra severe frosts of long duration during January, this will greatly interfere with the work of lifting the roots, especially if no precautions have been taken of either heavily covering a portion of the old bed or that of lifting enough roots, storing them in a shed or other place where they can be covered with fine moist soil and plenty of litter. On no account ought the roots to be long exposed to frosty air or be dried in any way, as this will have the effect of greatly weakening the top growth

as this will have the effect of greatly weakening the top growth.

Seakale should also be lifted and stored in moist soil in readiness for placing in the Mushroom house or a warm dark corner. The crowns of the old purple-topped form are usually quite hardy, but not so those of the Lily White, and these ought, therefore, in particular to be either lifted and protected or be covered with ashes or litter where they now are. Rhubarb requires no protection, but a severe frost may render it impossible to lift the clumps when most wanted for forcing, and some of these again should either be got up in readiness for forcing or be protected where growing. If any roots of either Seakale or Rhubarb are being forced in the open ground, the heating material should be examined frequently. When largely composed of leaves these may become cold and saturated, and require livening up with a little stable manure or fresh drier leaves. If stable manure has been principally or solely used, then overheating, especially after a change from cold windy to mild weather, may occur. Remedy the latter dangerous occurrence by opening out the heating material, banking over the tubs or pots again according as this can safely be done.

Ridney Beans—These require a brisk heat, or say that of a Cucumber house or Pine stove, as much light as possible, and should be carefully watered. Syringing is not necessary, but if the pots are fairly well filled with roots a little soot water or other liquid manure may well be given occasionally. Sion House is one of the best for early forcing; Ne Plus Ultra and the dwarf Osborn's Forcing also being suitable. New seed will always germinate the most quickly and strongly, the plants throughout being of superior vigour to any obtained from old seed. If wanted up quickly set the pots direct on the hot-water pipes. Not less than twenty-five pots should be filled at once, the sowings being divided by intervals of from a fortnight to three weeks. Nine-inch pots answer well when properly drained, and nothing better than old Chrysanthemum soil can be used.

Salading.—If there are any signs of the Endive not holding out well, or if Lettuces are always in demand, seed of any White Cos form may be sown moderately thickly in pans or boxes of fairly rich soil, and placed in heat to germinate. Before the plants become drawn and damping sets in, transfer to shelves near the glass in a warm greenhouse or other structure where a gentle heat is constantly maintained. There should be no thinning out, the aim being to have a number of plants for cutting over Mustard and Cress fashion when about 4 inches or rather more in height. Sow seeds in two or three boxes at a time every

fortnight for succession. Early raised plants of either Golden Queen or Early Paris Market Cabbage Lettuces force admirably in beds of good soil on the top of a gentle hotbed, excellent hearts being had late in March or early in April. Sow some seeds soon, and treat very much as advised in the case of the Cos varieties for cutting young, only there should be no crowding of the plants. Much Endive ought not, therefore, to be introduced into these warm dark places at one time, but rather a few plants each time at fortnightly intervals. Sow Mustard and Cress rather frequently, or every week; perfectly fresh good soil should be used every time. Sow the seed thickly, the Cress on the surface and the Mustard nearly so; keep the soil uniformly moist, and cover with mats or brown paper till the salading is $1\frac{1}{2}$ inch in height, when it may be gradually exposed.

Seed Potatoes.—These ought from the first to have been separated from and treated differently to the ware or cooking Potatoes. Should all have been stored together then ought the first favourable opportunity be taken of separating them, or otherwise those intended for planting will, in common with the rest, sprout prematurely, and be greatly weakened accordingly. It has been repeatedly proved that much the best results attend the practice of planting medium-sized whole tubers in preference to either small or cut sets. Therefore select and store the requisite number of medium-sized tubers rather thinly, and in a cool light place. They ought not to be stored in deep baskets or boxes. If there are no suitable sheds let the seed Potatoes follow Apples on the shelves in fruit rooms. The Ashleafs ought to be stored in a single layer on smallest ends in shallow boxes or trays, as should they lose their first strong sprout their value will be greatly reduced. If a severe frost be anticipated all ought to be well protected, but uncover after the frosts are over. If it is intended to force Potatoes early either in pots, boxes, or pits, select a good short-topped early variety, such as Mona's Pride, Old Ashleaf, and Sharpe's Victor, and start them into active growth in a vinery or Peach house.

Ware Potatoes.—Allowing these to form long sprouts greatly detracts from their quality when cooked, and should be prevented as much as possible. When outside work cannot well be proceeded with, the men may be employed in turning heaps of Potatoes, any that are diseased being thrown out, and sprouts just beginning to form on the rest rubbed off. Avoid storing them in great heaps, keep them dark, and protect heavily whenever severe frosts are imminent. Potatoes in clamps ought also to be examined, and if need be turned and treated as just advised. A dry mild day should be chosen for this work, and the heap be again heavily covered with dry straw banked over with soil.

APIARIAN NOTES.

THE WEATHER AND BEES.

The weather for the past few months has been of a most changeable nature, calms and storms following one another in quick succession, the same with high and low temperatures. On the 8th, 9th, and 10th of December the thermometer ranged between 9° and 32°, and on the 11th it stood nearly all day at 51°. Storms were even more sudden, a main feature in them being their eccentricity in blowing furiously in narrow and diversified tracks. The great storm on the 17th ult. that devastated some parts in the north of Scotland, was with us, comparatively speaking, very moderate, but the one on the 8th inst. proved of a more furious character. Fortunately, however, our hives were unmoved, although fully exposed to the full force of the gale.

Since October bees have not been long confined to their hives, but at the beginning of November, early in the season as it was, several hives of bees that came under my notice showed signs of abdominal distension, and there were more dead bees at each than were at the whole of my hives last winter. The cause was not far to seek. These hives had young queens hatched in August. They were bent on breeding, and did so to a great extent. longest wintry weather at one stretch being the end of October and beginning of November, the young bees did not get an airing in time, hence their succumbing to the protracted confinement. I have repeatedly shown the fallacy of the doctrine that aged bees constitute a dwindling apiary, and that one of increase can only be insured by having late bred bees, also that bees live during working weather six weeks only. I possess at least half a dozen hives that have had very few bees bred in them since June. The aged bees are numerous, and I have no hesitation in saying many of them will be alive next May, yet I never experienced a more trying time for bees during the two months they were at the Heather than I did this year. The first month was very stormy, and the other windy, if with less rain, and often the bees had great difficulty in reaching their hives. But they are still alive, although according to the theory propounded every one should have been dead by the middle of July. Bees are never old and prepared to die until their wings become ragged and unable to bear their bodies aloft.

As all my hives have had good flights, I have no fears of further calamity from any form of distension; but owing to the changeable weather they have lessened their stores, and some of them feel much lighter than I would have expected. Only a few of them may suffer from short stores, but these will be supplemented the first opportunity in January after their first flight of 1894. This is necessitated, too, by the fact that young bees are sure to be hatching by the middle of the month, or perhaps earlier. A lesson from the foregoing should be valuable to beginners, showing as it does the stupidity of stimulating bees to breed. The bees in the hives mentioned never were fed, and, contrary to my wishes, bred much, when I would have preferred them to be quiet. Feeding bees, if they have sufficient stores, does more harm than good, and crown feeders militate against progress, and increase the labour of the bee-keeper.

Before despatching this letter I went to have a peep at the bees. It is midday of the 16th, the thermometer is standing at 54° in the shade; every hive is busy, pure Carniolans the least. Punics are busy carrying pollen, mostly from pea meal, but from flowers as well. Hellebores are in bloom, Snowdrops and Primroses are on the eve of opening, while a few of the hardy Chrysanthemums near the house have their flowers fresh. The barometer in two days has risen from 28·10 to 29·80.—A LANARKSHIRE BEE-KEEPER.

HUMBLE BEES.—A correspondent writes from New Zealand:—There was a very noticeable increase in the number of humble bees last year, and this season it is more noticeable, much to the regret of all who keep hives of the ordinary bees, for it is believed the large bee is depriving them of honey, and that in a few years apiaries will contain no honey. Last season some found that their honey was not nearly so plentiful as formerly. The same complaint is heard everywhere, and I have not yet heard a good word said on behalf of the humble bee, and it is said that efforts are being made to reduce their numbers. If all that is said against this importation be true, it is to be regretted that they were brought out to fertilise the Clover.

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—Amateurs' Guide in Horticulture. E. Webb & Sons, Wordsley, Stourbridge.—Spring Catalogue. B. S. Williams & Son.—Flower, Vegetable, and Agricultural Seeds.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Chou de Burghley (R. C. W.).—The specimen you send is fairly representative of Chou de Burghley, and although there is no Broccoli head in the centre, we can see a very distinct difference in the divided head from that of an ordinary Cabbage. The miniature heads do not usually form till the spring, and not then in all the plants. We think too early sowing is often practised with this vegetable, the month of May, in our experience, being soon enough. When well cooked Chou de Burghley is quite distinct in flavour from the ordinary Cabbage. We have found it both hardy and good in the spring.

Early Forced Lily of the Valley (A. H. E.).—In order to have Lily of the Valley in flower by the middle of November forcing should commence fully three weeks before the spikes are wanted. If the crowns will not start within a fortnight of being introduced into a strong heat it is very doubtful if they will grow at all. Well prepared home-grown crowns are fully equal to the best imported, but as a rule are not sufficiently matured to force so early as desirable in your case, and you ought to procure some of the earliest Berlin crowns imported, or say directly some of the wholesale importers get them. If you have a propagating frame over a tank of hot water that is the place to force Lily of the Valley. Do not pot the crowns, but merely place them thickly in cocca-nut fibre refuse. The latter should be kept constantly moist, and the frame closed and darkened by mats. A strong heat, or say about 90°, will be needed, and you will have to be content with comparatively small spikes with weak stems and no leaves.

Limewashing Vinery Wall (F. J.).—A limewashed wall is more favourable on the score of light and more pleasing to a cultivator's eye than a dingy cemented one; the first indicates cleanliness, and the latter dirt—disease germ infestation. The wood, iron, and trellis work should be thoroughly cleansed with softsoap, hot water, and a brush, and the glass with c'ean water. The walls also may be washed with hot water, and when dry dressed with a solution of sulphide of potassium, 1 oz. to a gallon of water, using a rather stiff clean painter's brush. The sulphide of potassium may be procured of any chemist. It is commonly known as lime of sulphur.

Bone Ash as a Manure (J. B).—Bone ash is a phosphatic manure, supplying the soil with phosphates and about 1 per cent. of alkaline salts. It contains no nitrogen, the element forming it being lost in the burning. The manure may be used for all garden crops, including flowers, fruits, and vegetables, at the rate of 2 to 4 ozs. per square yard. It is a permanent manure—that is, it lasts longer than the year in which it is supplied, and is more calculated to promote a sturdy floriferous or fruitful habit and a fibrous root formation than free growth; but this can be induced by supplying nitrates of potash or soda, or sulphate of ammonia when the plants or trees are starting into growth, about one-fourth of one of these substances being sufficient to mix with the bone ash for plants in pots, also for Vines, Roses, or vegetables. Alone it should only be given at intervals during the growth of plants and crops.

Resting Lælia anceps (A. E.).—This is one of the most serviceable and attractive Orchids for flowering during midwinter, and we presume yours are now in flower. It will not hurt the plants, and the flowers will last the best part of a month if they are placed in a cool house, provided this is kept dry and just enough heat maintained in the hot-water pipes to insure a gentle circulation of air. After flowering return the plants to the house in which they were grown, an ordinary stove temperature, or such as suits Cattleyas when at rest, answering well. Keep the soil only just moist, enough water being given to prevent shrivelling, and not sufficient to excite growth. March will be quite soon enough to start them afresh, what repotting or top-dressing there may be needed being done then. Keep Cælogyne cristata in the house in which the plants formed and matured their growth. The flower sheaths ought to be already showing at the base of each strong young pseudo-bulb, but should not open for another month or rather longer. If freely wa ered now many of the flower spikes would damp off, and only enough water should be given to prevent the soil becoming dust dry.

Preventing Cucumber Root Disease (Reader).—The grower

referred to does not use horse or any animal manure with the soil when it is of a fibrous nature, and only about one-fifth of fresh horse droppings when it is ordinary loam and not containing a large percentage of the remains of previous dressings of manure. It is quite possible to grow as large a crop and of as good quality in Cucumbers by the use of artificial manures alone as by mixing farmyard manure with the soil. The soil, however, must contain a fair amount of humus, and be of an open nature so as to encourage a free root action. Kainit is an excellent dressing for land liable to produce some kinds of club in the plants grown upon it. It may be applied at the rate of 2 lbs. per rod, or if you want to mix it with the soil, 2 ozs. is sufficient for an ordinary barrowload of soil with farmyard manure added, and double the amount may be used without the farmyard manure, but an excessive use of kainit is liable to sterilise the soil, therefore it must be used in moderation. The following is a good chemical manure for Cucumbers: three parts bone superphosphate, two parts powdered saltpetre, and one part ground gypsum, mixed. Keep it dry, and apply 2 to 4 ozs. per squarc yard at fortnightly intervals as a top-dressing, and wash in.

Diseased Carnation Plants (An Old Subscriber). — The plant with roots (No. 1) is infected with a fungus (Helminthosporium or

with roots (No. 1) is infested with a fungus (Helminthosporium or Heterosporium echinulatum). It was first described in England on Carnations twenty-three years ago by the late Rev. M. J. Berkeley. It was introduced into this country from the continent, and in America it is considered a recent importation from Europe. The flocci (mycelial threads) are irregular, simple or slightly branched, bearing here and there multiseptate spores; these are brown in colour, and when produced in abundance, together with the threads, darken the spot upon the leaf. The spot then possesses different shades of colour, according to the number of spores produced. The growth of the fungus from the centre of the spot is centrifugal, and the dark colour is frequently arranged in concentric rings, of which your plant affords excellent You may dip the plants affected in or syringe them with a solution of sulphide of potassium, half an ounce to a gallon of water, and repeat at intervals of a fortnight to three weeks. The other plant (No. 2) is attacked by the Carnation rust fungus (Uromyces caryophillinus), the presence of which is indicated by a slight swelling on the leaf or stem, one-eighth to a quarter of an inch long, and in some cases The surface of the swelling soon becomes pale or nearly as broad. nearly colourless, since the green colouring matter at that point is destroyed by the growth of the fungus, and is obscured by the crowded fruiting threads (mycelium) and young spores of the fungus. fungus matures these spores become brownish in colour, are roundishoval in shape, and so close together as to impart a dark brown colour to the colony or sorus (fructification part). The epidermis (skin) of the leaf or stem is ruptured by the growth of the fungus within the tissues and turned on one side, where it usually clings as a whitish ragged looking film by the side of the now exposed mass of spores. The rust fungus attacks the Carnation at all stages of its growth, not sparing the young cuttings, but they were probably infested before insertion through being taken from a rusted plant, which, as regards the cuttings, showed no trace externally of the threads within the tissues.

most approved by growers is to destroy all affected plants, remove the soil, and disinfect the surroundings—that is, thoroughly cleanse the house. This means the loss of valuable seedlings, and as yours is one we recommend your quarantining it and all infested plants, spraying them at intervals of ten days to a fortnight with Bordeaux mixture, made as follows: -4 ozs. of sulphate of copper dissolved in a vessel by itself in 2 gallons of water, 4 ozs. quicklime (light lumps) slaked in another vessel, and formed into a thin whitewash by adding water. When cool pour the whitewash into the mixture containing the sulphate of copper solution slowly through a hair sieve, stir, and add enough water to make 7½ gailons, stirring well. The mixture must be used at once, it being preferable to lay the plants on their sides on a floor, spraying them so as to wet every part of them. This can be done easily by turning them, and taking care to only coat the parts with the finest possible film of the mixture. The house may be sprayed, wetting every part, and any spores lurking about will be destroyed directly they push their germinal tubes, whilst the coat on the plants will render them invulnerable to any spores alighting on them. The mixture must not be kept over twenty-four hours, therefore take such proportionate part of the ingredients each time as is needed for spraying the plants. Illustrations of the above-mentioned diseases attacking Carnations, with descriptive

notes, were published in the Journal of Horticulture for July 13th, 1893.

Celery Decaying (Constant Reader).—In most gardens a few "sticks" of Celery are found with completely decayed hearts when lifted; but your experience is a more serious one, five bad "sticks" out of every six being an extraordinary loss. Unfortunately, it is very doubtful if we can suggest either the actual cause or the remedy. It is not merely Celery grown in trenches that is liable to behave in this way, but the same thing occurs in America, where the bulk of Celery grown is planted on the level. Nor has the past hot summer anything to do with it, as, according to your letter, the losses have been quite as heavy in previous years. American authorities state that it is the most rapidly destructive disease that affects Celery, and add that it has not yet been fully investigated and classified. It is most probably some form of bacterial disease, the germs being powerless against fully matured outer stalks, but are quickly at work when washed down into the heart. Anything that is to operate against the disease germs must the heart. Anything that is to operate against the disease germs must also find its way down to the hearts, though if the leaves were very lightly sprayed with the Bordeaux mixture the amount that would reach the eatable portion of Celery would be infinitessimal and quite harmless. One recipe for mixing and applying this remedy is as follows: Dissolve 2 lbs. of powdered sulphate of copper in 4 gallons of hot water, adding another 4 gallons of cold water. Slake 1 lb. of caustic lime, then diluterit to the thickness of milk in 2 gallons of water. When the copper solution is quite cold add the limewash, and well mix all together by repeated stirring. It should be sprayed very lightly over the rows of Celery within twenty-four hours of mixing, and must be kept constantly stirred while being used. An earthenware or wooden vessel should be always used. Dry weather should be selected for the spraying, and there ought to be not less than three applications during the summer months. It is somewhat strange that you should have lost so much Celery every year lately, and in all probability the severe attacks are due to neglect in burying deeply or mixing the decayed Celery with quicklime. None should be left lying about, and the site chosen for the Celery trenches next season ought to be well away from where this crop has been grown of late.

Names of Fruits.—Notice.—We have pleasure in naming good

typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state. (Devon).—1, Dumelow's Seedling; 2, Blenheim Pippin; 3, Not known. (Knebba).—1, Not known, no flavour; 2, Swan's Egg; 3, Hunthouse; 4, Orange Goff. (J. E. Kelly).—1, Adams' Pearmain; 2, Kerry Pippin; 3, Margil; 4, Winter Hawthernden; 5, Knight's Monarch. 6, Round Winer Nonesuch.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (J. J. S.).—1, Libonia floribunda; 2, L. penrhosiensis. (H. M.).— Echeveria retusa. (C. P.).—Adiantum formosum. (L. B.).—1, Ardisia crenulata; 2, A. mamillata. (Amateur).—Cyperus alternifolius. (H. M.).—Cypripedium insigne Maulei. (Orchid).—A good form of Lælia anceps. (C. H. D.).—Dieffenbachia Bausei.

PROFITABLE LIVE STOCK.

How to feed to profit is a matter concerning which some of the best stock breeders are at variance, sides being taken for and against extreme early maturity. Some there are who would limit the age to three years. Their views had powerful support at the annual meeting of the Smithfield Club by Mr. J. D. Fletcher, who had at the Cattle Show tangible proof of their importance in his first prize Shorthorn heifer, weighing 16 cwt. 3 grs. 24 lbs. at the age of two years nine months, and his champion polled Aberdeen-Angus heifer, Pride of the Highlands, two years eleven months old, weighing 17 cwt. 2 qrs. Other graziers advocate an extension of the term of maturity to four years on the score of economy of feeding. It is altogether a question of profit and loss, and that is the test to apply to it. Extravagant feeding for the mere winning of a prize will not bear such a test, nor will much stall feeding, if profit has to be looked for in the manure, as it often has been. But if straw used for litter is to be regarded as an equivalent for the manure, then the margin of profit is often a very narrow one indeed. In proof of this we quote from a pamphlet on "The Early Maturity of Live Stock," published

some six years ago by the Field, a complete record of the dietary of a beast sold as prime beef at seventy-one weeks old :-

The value of the manure was estimated at 20 per cent. on the cost of the food (£19 5s. 2d.), but, taken as the straw equivalent, we have then only a profit of 11s. 4d. remaining.

The dietary is instructive as showing amounts and the progressive scale of feeding a young beast calved in spring and sold at harvest in the following year. In the dietary something might be gained by the substitution of corn for cake, both to avoid cake bills and to utilise home-grown produce, in the guise of a mixture of crushed Oats, Wheat, Barley, Beans, Peas-all or any of them, it matters not-for it has been proved by the Woburn experiments of the Royal Agricultural Society that bullocks thrive equally well upon corn or cake; and we are disposed to favour the corn on the score of economy, and also because a mixed dietary is always the most wholesome.

On the other hand, it is worth while considering if we cannot do better where rich pasture is available by finishing beasts either at two or three years on the grass, avoiding stall feeding altogether. In doing this the calves would only be let run out in favourable weather; all exposure to gad flies, cold, or wet would be avoided. Crushed corn would be given in pans on pasture if required; they would be pushed steadily on during the winter, and if intended for market by the second autumn they would have some corn all the summer. If kept over a second winter they could be so cared for as to go on pasture in the following spring in such fresh condition that they would come out fat by September or October.

The treatment of such beasts must always be tentative and not by line and rule. When kept till the third autumn corn would be used during the winter, but it would hardly be required at all with a full bite of rich grass in the spring and summer. The fattening property of the best grasses and Clover is simply marvellous; be it our care to see that the young stock leaves the yards for it in spring in such fleshy condition that the grazing tells quickly, and the beasts are kept going steadily on to early ripeness and fair profit. Very different this to the progress of those wretched starvelings, leaving the yards at turn-out time, with every rib so clearly defined with hollows between them, that one might suppose the idea of ridge-and-furrow roofing was suggested by them. Nothing can be more deplorable than their miserable plight, and it is difficult to see how any reasonable person can expect anything like profit from them. By all means pay heedful regard to economy, but see that it is an embodiment of judicious expenditure with avoidance of waste. Spend freely when it can be done to good purpose, and remember that waste avoidance includes the wise prevention of loss of condition in our stock during winter.

WORK ON THE HOME FARM.

The pickling and smoking of bacon and ham are now being done as the pigs fed specially for the purpose become ready. We intend writing a special article on this important part of home farm economy shortly, and only mention the matter now as a reminder to home farmers that their method of bacon curing is for a supply from, say, New Year's Day till Christmas at the least, and the process must be altogether more deliberate and thorough than that of the bacon factory men, who accomplish in a few days for what the home farmer requires two months. Their bacon is intended for speedy consumption and not for long storage; it is, therefore, obviously unwise to introduce their method at the

Fatten and sell all sows becoming old or of large size; the only exception we ever make is with sows that are exceptionally gentle and quiet. But no sow should be kept for breeding after she becomes large, or rather approaches a size which involves risk of her lying upon her progeny. It is also evident that very large breeding sows must consume much more food than those of moderate size. It is at her second litter or farrow that a sow is at her best; this is our guide to breeding early, and the first farrowing should be when the sow is ten months old, the period of gestation being sixteen weeks. Bear this in mind in your scheme for the coming year, so as to have an ample store of porkers ready for corn stubbles; and when a young sow proves to be a bad mother, biting or eating her young, she must be fattened and sold. Temper in the sow often arises from soreness of teats, for which reason. and by way of prevention, the four sharp temporary teeth which yourg pigs have are broken off at birth by many breeders.

In any case we have always found it answer to have a few extra sows to make certain a full supply of pork and bacon for home requirements. Superfluous pigs of any age or size always find a ready market, fatten quickly, and are soon out of band. Place sows about to farrow in comfortable quarters—a commodious sty with a frame round the sides to protect the young pigs when the sows lie down. Use only a moderate amount of short litter, shut in sow and pigs in very cold weather-it is then that a passage at the back of the sty is so useful. Do not wait for the weaning before feeding the pigs, but as soon as they are able to eat raise the slip board along one side of the sty, so that the pigs can get out to a low trough placed near it outside. Barleymeal, ground oats, or wheatmeal, with milk, answers well for them.

SPRATTS' ALMANAC.—Spratts Patent, Limited, send us a copy of their Almanac for 1894. It contains an illustrated sheet, with calendar for each month, with notes explanatory of the subjects illustrated. It will be acceptable to fanciers of dogs, poultry, and domestic pets. It is supplied to customers who apply soon enough and enclose a stamp for postage to Henry Street, Bermondsey, London.

LIVE STOCK HANDBOOKS.—Messrs. Vinton & Co., London, proprietors of the well-known "Handbooks of the Farm," have, in response to numerous applications, commenced the publication of a new series, entitled "Live Stock Handbooks." The first volume is devoted to sheep, and has been written by Professor Wrightson. There are twentyfour full-page engravings, and the price is 3s. 6d. This will be followed by handbooks on light and heavy horses, cattle, pigs, and other animals.

"LIVE STOCK JOURNAL" ALMANAC FOR 1894.—Once more is the high standard of this useful annual well maintained. Each leading class of horse, cattle, and sheep has its special article recording its progress for the year, and so possessing an historical as well as a practical value. Pigs and poultry also have attention, besides which there are interesting and valuable contributions on Horse Breeding, Horse Shoeing, Influence of Food on Milk, Feeding Live Stock, Milk Records, Wool and its Preparation, Bacon Curing, Management of Pigs, and the Fattening of Poultry. This brief notice will suffice to show what a useful publication it is, useful alike for reference and for its special information upon matters of interest to everyone connected with agriculture. The work is illustrated and published by Messrs. Vinton & Co., London, 9, New Bridge Street, Ludgate Circus, E.C.

REMARKS.

10th.—Overcast till noon; very squally, with heavy rain from 0.30 to 1.30 P.M., and at times in afternoon; fair again in evening.

11th.—Rain at 5 A.M., and overcast early; sunny from 11 A.M. to 1 P.M.; fair afternoon and bright night.

12th.—Squally southerly gales. Occasional gleams of sun in morning; heavy rain from 1.45 P.M. to 4.30 P.M. Gale very severe from 4.30 to 5.30 P.M., and dropped suddenly at 6.30 P.M.

13th.—Overcast, with squails and showers till 10.30 A.M.; fine and generally sunny from 11 A.M. to sunsct; heavy shower at 7.30 P.M., and heavy rain from 11 P.M. to 2.30 A.M. on the 14th.

14th.—Heavy rain till 2.30 A.M.; overcast till about 10 A.M.; bright sun from 11 to sunset, and bright night.
15th.—Fine, with a good deal of bright sunshine in morning; generally cloudy in afternoon. 16th.—Fine, and generally sunny.
Milder, southerly winds and gales, low barometer, nd rain.—G. J. SYMONS.

PROBABLY there are few men except the ultra self-conceited who will not admit the existence of certain shortcomings in their year's record. Those who have apparently done the best, and, in fact, accomplished much on which they may dwell with satisfaction, will be the first to acknowledge that on certain points their judgment may have led them somewhat astray. Those are really the strong men of the day. Strong, because of their clear perceptions, and not shrinking from the recognition of facts, even when these were not in harmony with their prepossessions. Men who, in their own view, are ever in the right on every conceivable topic, who can see nothing wrong in what they say or do, and little that is good and true in others, unconsciously, yet very clearly, exhibit their own frailties.

Is not the present a good time for each to try and determine in which category he is rightly placed? The conduct of masters to servants and servants to masters, of parents to children and children to parents—has it all been right? all as it should be, and as each may wish it to be again? In rivalry has all been honourable, in controversy has all been fair, in government—the superintendence of man over man—has all been just, in duty have all been diligent, in trust have all been faithful? We know, all know, there have been sad, even fatal, departures from the line of right in cases that have been "found out." But what of the shortcomings yet more or less obscure? Let them be sought out, thought over, recognised and diagnosed. No one can be the worse for this self-searching, and it may reveal what was not apparent, leading to a better line of thought, and a safer course to follow.

Has all been right in gardens, or as nearly as it might have been? Has there been undue austerity by those who direct or provocation by those who serve? Gardening is credited with having a soothing influence, yet it is not a panacea for wrong, not to say hot-headedness; it is also credited with the love that begets watchfulness and devotion to it as a pursuit, yet it is not a complete antidote to carelessness, laxity, even laziness. On these matters it will, perhaps, not be quite treasonable to suggest that blustering managers in gardens are, like weeds in flower beds, out of place; and equally so are the listless slippery lookers-for-night, who cannot hope to prosper in the calling into which they have pushed themselves or been pushed by their friends.

Nor does the mere possession of gardens by persons, no matter how wealthy, make all of them gentle and kind. There are gardens which could be named in which men are tormented and the right name for their houses is jails. There they are chained, for only men with large families are sought for, and who cannot, dare not, move and face what might be penury or destitution. Happily such examples of intolerance are few-chance weeds in the garden of humanity, making the flowers of the flock, the great mass of our nobility and gentry, "the country's pride," shine the brighter by the contrast. Which are served the better, those who repel by their severe exactions, or those who attach by just yet considerate ways? There is only one answer. Faithful service follows dutiful attachment. Of this we have thousands of pleasant examples over the length and breadth of the land, the exceptions being a miserable minority, soon it is hoped to become obsolete and forgottten.

Then are there not shortcomings in the literary aspect of

gardening—pens as if made to wound in controversy rather than elucidate and instruct? There appears to be a good deal of character in pens, and the makers might give them new names, to wit the "stinger," to make opponents wince; the "cynic" to tantalise; the "snarler" to demean; the "grumbler" to despise; the "dullard" to drive away readers, and so on. It is true some of them have a recoil, and it is as well so, perhaps better, or the wrong men might get hurt the most. Even pens it will be seen, and as some of their victims have felt, are not all they ought to be, but have their shortcomings, needing rectification. The one now in use is apt to be refractory, and can only be exercised under a sharp rein, but it seemed to want a run before the year was out, and is having its way for once, to end possibly in the ditch known as the W. P. B.

Occasionally the attentive reader may fancy he detects shortcomings in the logic of literature—lines of reasoning that puzzle him somewhat, yet which he enjoys all the same. Sometimes it would seem the best of pens are prone to be "erratic," and surely the "D., Deal," is one of the very best, yet what does it make the good man say on page 552? "Tulips entail too much trouble" to become popular. They need planting in November and taking up in June. No other troubles are mentioned; but what "picking, smoking, sheltering, and brushing" are advised for Auriculas? What trouble the fungus is on Carnations, and the attendant doctoring, potting, and finger-and-thumbing? While as for Gladioli, the instructions read almost like a wail of despair. Yet these flowers must be grown; the hardy Tulips are not even honoured with a malady, they only entail "too much trouble." Oh, that pen !--and this! Into its sheath then mine shall go (but oh, not his!) perhaps, for a final rest; all depends on the fate of this its maiden effort; if its shortcomings are so flagrant as to meet condemnation the end will have come. The attempt-well meantto have a tilt at the seamy side of human nature will have failed, and nothing will be left for its incompetent guide but to retire into silence.—WATCHMAN.

AN EAST LOTHIAN GARDEN IN 1893.

THE year that is closing has been so exceptionally good from a gardening point of view, that before it is gone it may be worth while to chronicle some of its outstanding features. And yet, good as it has been, there have been certain times during its course when much uneasiness was felt. At its beginning the frost was very intense and trying, the times of drought in the summer, and also the gales towards the end. Exceptions to the rule, therefore, occurred, and all kinds of garden crops have not flourished equally well. Fruit and flowers fared best, much better than usual; but vegetables on the whole have not been so good.

The severity of the frosts early in the year destroyed many vegetables. Hardly anything in our garden was left save Leeks and Brussels Sprouts. Spinach was severely checked, but it grew well with the advent of warm weather. All kinds of Broccoli succumbed. If there was one kind hardier than another it appeared to be Methven's June, but that also was so much damaged as to be not worth retaining. Even the hardy and profitable Sprouting Broccoli was killed to the ground, so were the Curled Kales, and the Globe Artichokes were badly damaged. Later in the year the second crop of Cauliflowers was entirely destroyed by root maggots, and indeed all round this district the mischief worked on Cabbages and Cauliflowers by these was very great. Many cottagers had their green crops destroyed. However, later sowings of Cauliflowers were all that could be desired, King of the Cauliflowers and Magnum Bonum were particularly good. I saw beautiful specimens of a late variety twelve months ago named Drummond's Favourite. This I tried, and have found it to be an excellent kind; but so far as I can determine it is identical with Veitch's Autumn Self-protecting Broccoli. However that may be, both are

No. 2361.—Vol. LXXXIX, Old Series.

superior strains, and for cutting late in the year they are indis-

Spinach did moderately well up to the sowing made about end of August, of which most of the plants died out of the ground, so that we are depending for a winter supply on two earlier sowings. I have for many years past raised three distinct crops of winter Spinach, as it is not uncommon for that sown at the time which is suitable in general to fail as it has done this year. Paresseuse de Catillon is a French variety, which did well during the severe drought. It is also good for winter sowing, and so is Lent, a slow seeding variety. Peas proved generally unsatisfactory. The late crop was past earlier than ever I recollect it to have been. Mr. Eckford sent me a selection of his seedlings to try. Of these I was greatly pleased with Fame, which appears to be an improved Ne Plus Ultra. Epicure and Censor I also liked, but none of the sorts impressed me so much as the first named, of which I hope to grow many in the coming season. Regarding Potatoes, all that need be said is that they were of excellent quality, but small of tuber. Brussels Sprouts are very good. Spring-sown Onions were maggoteaten almost to the whole crop, and we have had to depend up till now on bulbs of January-raised Cranston's Excelsior, an Onion which is a good keeper as well as being large in size.

A noteworthy feature of the year is the manner in which lost time has been made up by autumn and winter crops. Seeds sown during the drought germinated rather badly, and in consequence many crops had to be sown again, making the plants much later in being set out than usual. Broccolis, the seeds of which germinated well, were long in making growth, and also seemed likely to be but of small size. But in every case plants have made an almost abnormal growth, the result being that there has been an abundance of succulent produce and a promise of plenty to follow. London Coleworts happened to be a "miss at first," but I never remember later ones of these to have been finer in quality, and still there are

many of green heads to use.

Despite an unpromising spring, the hardy fruit crops were above the average in bulk, and in quality they were generally superior. The two crops which were the least promising-Pears and Strawberries, finished good average crops, though they were both of short duration, the latter ripening all at once, and the later sorts of the former are ripening abnormally early. Small fruits were also over earlier than usual. We, as a rule, have Currants and Gooseberries well into October, but these were all past in the beginning of September. No doubt the fruit would have hung much longer, but they were literally cleared off the bushes in the course of a few days by wasps. I think of all crops Apricots were the most satisfactory. The trees blossomed abundantly and set an enormous crop, which required to be freely thinned. The season was much longer than usual, the earlier fruits ripening in the commencement of August, and the crop continued until the middle of September. I do not remember Apricots ever to have ripened so well all the season through. In 1867 and 1868, in 1875, and again in 1887 Apricots ripened well, but not, as a rule, so perfectly as during the present year. The largest cropping sort was the Royal. The earliest fruits were gathered from trees of Breda and of Kaisha. One of the latest and best was D'Alsace, a variety well worthy to be recommended. Shipley's and Peach were also good. Hemskerk did not bear a crop. autumn added the following kinds-Angoumois Hatîf, an early ripening variety; Powell's Late, and La Delicieuse, the latter a new variety from Syria.

I was also greatly pleased with the Plum crop. The trees blossomed but sparsely, and on old trees the crop was not large, in no case requiring to be thinned; but generally there were sufficient fruits for the trees to perfect, and all the varieties ripened better than usual. The season began with Rivers' Early Prolific and The Czar in July, and ended with Coe's Golden Drop in October. The Czar is a grand acquisition, when fully ripe being very rich in flavour. Kirke's was also good. I had a grand crop on a young tree of Cox's Emperor. Strings of fruit set all over the tree, and after severe thinning a very large crop remained. Fruit was gathered off this tree during a period of seven weeks, and it was appreciated both for dessert and for cooking. Victoria was, as it always is, grand, and so was Jefferson. Green Gages were particularly good this year, so also was Magnum Bonum This is a Plum which is highly esteemed in our case both for cooking and for dessert, and during several weeks this year we were able to supply good fruit. A particularly good late Plum which fruited well this year for the first time is Monarch. The perfection of Plums is, doubtless, Coe's Golden Drop when at its best, as during the past summer, and whoever is without a tree in his garden ought to make good the deficiency at once. I have added, among other sorts, Archduke, a late variety, and Purple

Pears were like Plums, inasmuch as old trees did not bear

well, while on the other hand young trees bore an abundance of fruit. The first good Pear to ripen was Clapp's Favourite at the end of August. Since that time we have had an uninterrupted supply of better fruit than we have ever had previously, and nearly all from young trees. As mentioned all varieties have ripened earlier than usual, and as the season progresses this abnormal precocity in ripening becomes more pronounced. The best flavoured Pears we have had during November and December were Doyenné du Comice, a most delicious sort, the well-known Marie Louise, Winter Nelis quite six weeks earlier than usual, and now past, and Knight's Monarch, which will keep till the beginning of 1894. Beurré Rance is now ripening, and I notice that Easter Beurré is also softening, though in most years it is towards the end of February before these begin to ripen. Nec-Plus Meuris, however, is still hard. I have added a few cordon trees to our collection, including Alexandre Lambré, Baronne de Mello, the old Beurré Bosc and Beurré Hardy, Nouvelle Fulvie, and Marguerite Manilard.

Apples were a full crop, but they did not set so freely as to require thinning; at least, very few trees did. The quality of the fruit in some sorts was, perhaps, as good in 1887, but as a whole the present was a better Apple year. In 1875 we had a larger crop, but not equal in quality. Warner's King, Nelson Codlin, Tower of Glamis, Ringer, Keswick Codlin, Blenheim Pippin, Frogmore Prolific, and Dutch Mignonne were exceedingly fine. As regards the keeping qualities of the fruit I see there is now scarcely any turning bad. I have had Tower of Glamis, Nelson's, and Stirling Castle in as good condition as I ever saw them. The wood on the trees is beautifully budded, and the prospect of a heavy crop next year is most promising. Selected Apples brought a high price, and that at a time when inferior fruit was all but unsaleable. Perhaps the most abnormal feature of the year was the behaviour of an old Fig tree, which, not satisfied with presenting us with some splendid fruit at the usual period, yielded a second crop in October. The fruit was very small, but of good flavour. A second crop of Figs is, so far as I am aware, a very uncommon occurrence in Scotland.

I transplanted a large number of trees during the autumn, these mainly Plums and Apples. The roots, as a whole, were in prime condition, and taking these as a standard I conclude that the growth of roots in the soil has been as favourable as the growth of

the wood.—B.

(To be continued.)

NOTES ABOUT PARSLEY.

THE brilliant emerald green of the Parsley, so pleasing at this season and so good to have in abundance, emboldens me to add a little to a subject which may appear to have been already thrashed out in the Journal of Horticulture; but I propose to go a little way off the beaten track of good culture, where even breakdowns will occur, to say something about no culture at all, viz., to have it as a weed, and it is probably better to have it that way than to not at all.

The way it will grow as a weed (for when out of its place it comes under that definition) is, I think, noticeable more or less in all gardens, until the conscientious "scuffer" cuts short the career of these stray plants, though one may escape to point a moral with its sturdy luxuriant foliage. On this I take my text, off the beaten tracks; but nothing new, oh! no; "there is nothing new under the sun," though a good deal we do not see, and some things we will not see.

Now for my way; it is scarcely a plan or a method. Take, say, 2 ozs. of seed of any good curled variety—there seems to me but little, if any, difference in the kinds—though they be somebody's Pride or someone else's Perfection, all are good; time, from the middle to end of June; position, here, there, and everywhere; aspect, north, south, east, and west, close up under the walls in small nooks and corners where the autumn zephyrs carry the leaves, in the open, between lines of fruit trees, any place where there is not room for anything else, and particularly in those spots you think it will not grow. Take a pointed stick, scratch the face of mother earth, scratch it deep, she likes it; drop in a few seeds sparingly as if they were gold, close in with your feet; so go on till your seed packet is empty. Nothing more, only keep off the genius with the "scuffer," or his zeal may result in wiping out your labours as effectively as a fresh hand in a certain garden who was sent to fork up all the Horsetail (Equisetum), which he did, and a good bed of Asparagus besides, remarking to his horrified chief, who arrived too late, "Master, I ha' dug up all they durned puttock pipes."

Granted that such catastrophes are averted, and you feel on seeing the plants that Art must assist Nature, take equal parts of

soot and guano and sprinkle them well with it, letting a "gossoon" (Anglice, boy) go after you with a watering pot and wash it in, and when you are laughed at for having too much Parsley grin and bear it.—E. K.

RASPBERRY JOTTINGS.

There were rumours of phenomenal prices for Raspberries in the early summer, £35 and £40 a ton being freely talked about, as though such figures only needed mentioning to be realised; but either the returns were not secured, or else those who were lucky enough toget them have kept their own counsel. It is always wise to allow a liberal percentage for contingencies when such figures are quoted, for they are abnormal; but after making all reasonable allowances, the snm is not whittled down below a fair and profitable margin. Raspberries have paid many growers very well this year, much better than Strawberries in some cases; and indeed where this fruit does well, it rarely fails to give a good return.

When at Knockholt a short time ago, I met Mr. Waterman, who was formerly the head of the gardens at Preston Hall, Mr. Brassey's beautiful mansion near Maidstone, now ably managed by Mr. Jarman. Mr. Waterman has gravitated into the trade, having become the possessor of a compact nursery; but in addition to this he grows small fruit for market, chiefly Raspberries and Strawberries. I mention his name in connection with the former, because he makes an emphatic stand against the general opinion that "there's nothing like Carter's," having a variety which, he contends, is better, while at the same time partaking of the dwarf character of the great market sort and consequently needing no stakes. Now if there be in cultivation a Raspberry of the Carter's Prolific style of growth which is as good a grower and fruiter, and which wears better, it ought certainly to be known.

The name of the Raspberry referred to is Dr. Maclean, and Mr. Waterman tells me he has known it for many years. He has several acres of it at Knockholt growing side by side with Carter's Prolific, and thus a glance suffices to show the similarity in their styles of growth. They are both dwarf and sturdy, needing no extraneous support. This season of the year is not the best for comparing the points of Raspberries, and the most that can be said about them is that Dr. Maclean is rather cleaner and brighter in the cane than Carter's. Such a difference might easily be brought about in the same variety by varying soil, but the two are growing

on the same ground in this case.

Dr. Maclean is a name that has a familiar "smack" about it, but perhaps this is through the well-known Pea. I have not met with a Raspberry of that name before, and do not see it in the "Fruit Manual." There is a variety there called McLaren's Prolific, and between McLaren and Maclean there is not a great gulf fixed, but Dr. Hogg describes the former as a "double-bearing variety, of robust growth, and producing immense second crops on the young shoots of the same season." Dr. Maclean is not robust in the same sense as Superlative and Hornet, nor from what I gather has it marked double-bearing proclivities, although, like most other sorts, it has borne a second crop during the past extraordinary season. I should like to learn more about this Raspberry, of which Mr. Waterman has a fine stock, and which pays him, he tells me, very well.

Despite their taller growth, which is against them from the market grower's point of view, there is every sign of a large demand for Superlative and Hornet, the former more particularly. The young canes of this grand Raspberry were bearing heavily in Messrs. Veitch's nursery at Slough in the autumn, but that, of course, is not a very weighty point. What are chiefly to be remarked are its merits as a summer sort. It is of very free and robust growth, tall enough to require outside support, but a prolific fruiter and bearing splendid berries. It is rather significant that, although the market men look askance as a rule at a Raspberry which is not self-supporting, several of them are anxious to

get Superlative, being convinced of its high merits.

The fact of Hornet doing so well at Chiswick in comparison with the best sorts should cause attention to be given to it, and it is not there alone that it has given abundant satisfaction. A Herefordshire grower, about whom "J. B. R." knows more than I do, finds it the best sort which he has tried, and does well with it in the market. It is unquestionably immensely prolific, while the fruit is of large size and splendid colour. It requires support, growing to a great height in good soil, and this is supplied in the form of strained wires. Either as a garden or a market variety it is doubtful if there is a Raspberry which gives finer crops of large fruit than Hornet. It is pretty safe to prophesy that it will grow rapidly in popularity as time goes on. At the same time, so far as my observation goes, Superlative is being asked for much more frequently by the large growers, but this is perhaps owing to the fact that Hornet is as yet very little known.

The old Semper Fidelis is, I see, cropping up again. I saw a very large order executed for it quite recently, the canes going to a grower who wants the fruit for jam. Unlike most Raspberries the ever faithful one retains its form in the boiling, and as whole fruit jams are much more in demand now than the pulpy "brands" it is valuable on that account.

What may be termed the columnar system of growing the taller Raspberries seems to be very little practised, but when speaking about it to an Essex market grower ou a small scale recently, he told me that he had always found he got more fruit by shortening some of the canes in a stool to 18 inches or so, others to 3 feet, and then merely topping the others, than by the common plan. Naturally I asked him why, if he had found it good, he did not practise it now, and the response was, "Oh! well, I suppose it is because I have so many other things to do that I don't trouble about it." This is mild for Essex, and, after all, one cannot blame a man who is his own labourer for neglecting matters of this kind in favour of others which must be attended to when he is hard pressed; but the system is worth practising by those who are not in the difficult position of having to make a living out of about an acre and a half of ground. That any man can achieve such a result in the face of the fierce competition with growers having large capital to turn over, strikes me as being greatly to his credit, and a proof, moreover, of what a hard worker can do who feeds his ground well and crops it judiciously.—W. P. W.

ENRICHING THE SOIL DURING AUTUMN AND WINTER.

(Continued from page 416.)

When much of the soil of the garden or the field has been cleared of its exhausting crops, then comes the golden opportunity of enriching and otherwise preparing it for yielding an abundant harvest in the coming year. Heavy dressings of manure are of the utmost importance in maintaining the fertility of the soil by returning to it those constituents which previous crops have drawn out; but of at least equal importance is the time-honoured practice of deeply stirring it, so that the rain and air may penetrate, and carry with them those elements of fertility which are ever present in the atmosphere, and which all may turn to profitable account, with no greater outlay than that which is involved in the employment of the labour necessary to carry out deep culture. It is, therefore, apparent that every inch which is added to the depth of the soil renders it capable of drawing a proportionately greater amount of plant food from Nature's storehouse. These undoubted facts, to my mind, show conclusively the economy of deep digging, and the unwisdom of relying on mere surface-scratching.

Few will remember an autumn so fine, dry, and open as the past one, which has been exceptionally favourable for carrying out the work of manuring and digging vacant quarters. Should this satisfactory state of affairs continue for a few weeks longer, better opportunities will have been present for dealing with land of all descriptions than we have experienced for some years, during which time extended frosts have left but short periods for giving the soil that thorough preparation it ought to receive betore the

time for sowing and planting arrives.

Heavy soils should be the first to receive attention, as it is only by throwing them up roughly, so that the sun, air, and frost may pulverise the lumpy spits, that heavy soils of many descriptions can be gradually brought into good working order. When once these adhesive soils become thoroughly ameliorated, they prove uncommonly productive on account of the power they possess of retaining moisture and the food of crops. In many instances, however, it is unwise to attempt to do too much at once. The top spit ought first to be thoroughly worked before any attempt is made to deepen it. The earliest opportunity should be taken to wheel upon such land, whenever it is dry or frosty, a heavy dressing of partially decayed strawy manure; that obtained from the stables is the most suitable for the purpose. This manure may be left in heaps till digging commences, when it can be spread in patches as the work goes on; this will to a great extent prevent the loss of valuable manurial properties, which quickly escape into the atmosphere, if the manure is spread upon the land, long before being buried beneath it.

In digging heavy land, a strong fork, such as they use in the Kentish Hop gardens, is better than a spade, as the work is less laborious, and large rough spits can be upturned. The workmen should, however, be impressed with the absolute necessity of stirring the soil to the whole depth of the fork when thrust into the ground in a vertical position. A coating of from 3 to 6 inches of the manure ought to be placed in the trenches as the work proceeds. By using this in the rough state above described decay

is gradual, and the soil is kept open, so as to receive the full benefit from the action of winds and frost.

In cases where the soil is of an unusually retentive nature a commendable practice is to throw it up in sharp ridges about 2 feet asunder, by so doing a greater surface is exposed to the influence of the weather. In the spring these ridges should be levelled, and a coating of burnt refuse, coal ashes, leaf soil, old mortar, or sharp sand from the roadside be spread upon it and forked in, the forking again being repeated before planting. This practice was persistently followed in a garden in which I was employed some years ago, with the result that a stubborn clay was converted into a rich friable loam. Especial care should at all times be taken to keep off the land when it is in a wet condition. Any soils which have been thrown up roughly, but not ridged, ought, if possible, be forked over several times during the spring, and some of the opening materials above named be well worked in as the work

Lime is also an excellent agent in effecting the better working of heavy soils, as well as in sweetening those which are over-rich in vegetable matter. It should be covered with soil till slacked, and then spread upon the land at the rate of half an hundredweight per rod, and be properly forked into the surface. When the top spit has been improved in this way the work of deepening the soil should begin. This is best accomplished by double digging, by which means the soil is loosened and enriched to a great depth without changing the position of that on the surface. Commence by marking off a width of 2 feet at one end of the quarter to be operated upon. Take out the soil one spit deep and wheel to the opposite end, next place a thick layer of rough manure in the bottom of the trench, and mix it thoroughly with the soil as it is turned up another spit in depth. Then mark out another 2 feet strip, and place the top spit of it, as well as the shovellings, on the top of the subsoil first broken up, mixing manure with it as the work proceeds. When the end of the quarter is reached, the last work proceeds. trench can be filled up with the soil previously wheeled back. Land treated in this way will speedily exhibit a marked improvement if abundance of rough manure is used, but no half measures in this direction must be relied upon to ensure satisfactory results. -H. Dunkin.

(To be continued.)

HARDY FLOWER NOTES.

LUBINIA ATROPURPUREA.

THE lover of hardy flowers has, above all others, most cause to look with suspicion upon what are called "reintroductions"—that is, plants which have at one time been grown in this country, but have from various causes been lost to cultivation. This is, of course, not an invariable rule; but, as a rule, one may look with suspicion upon the "reintroduction" as having "either an old fault or a new one," the fault in most cases being that the flower is either not quite hardy or that it is worthless from an ornamental point of view. In his is attraptive has been recently ornamental point of view. Lubinia atropurpurea has been recently again offered to the flower-loving public, and I fear the experience of those who are induced to purchase will not be such as to render them enthusiastic in its praises. I have had the opportunity of thoroughly examining the Lubinia, and I fear I cannot speak so favourably of it as I should willingly do. It comes under the list of those which possess the two great faults of the reintroductions being neither very hardy nor very ornamental.

L. atropurpurea, which belongs to the natural order Primulaceæ, was introduced from the Cape of Good Hope so far back as 1820, and a pretty full account of it will be found in Maund's "Botanic Garden," vol. iii., page 52. Maund, while speaking generally in high terms of the Lubinia, admits its sombre appearance unless when the sun shines upon it and goes on to speak of the beauty of when the sun shines upon it, and goes on to speak of the beauty of the Lubinia as seen through a microscope, the petals and filaments being gemmed with minute Pear-like substances which, when viewed through a more powerful instrument, are seen to be glands "each a little gland on a cylindrical pedestal." As the specific name would lead us to infer, the flowers are of an intense dark purple. The plants grow about 2 feet in height, and may be increased by division or seeds. The latter do not appear to germinate well, and some protection in winter will be found advisable for plants left in the

open ground.

STOKESIA CYANEA.

It is seldom that this fine composite is seen in gardens, due no doubt to its late flowering habit and its doubtful hardiness north of London. I should, possibly, not have mentioned it now had it not been that some time ago I saw in a greenhouse a plant of it just coming into flower, and which was intended to be cut for exhibition in a stand of hardy herbaceous flowers. I cannot say

that I approve of this system of growing hardy flowers for exhibition, but there the plant was, and I am doubtful, if the way schedules are generally worded, a judge would be justified in excluding a stand in which the Stokesia appeared. At all events the few flowers which were open showed how beautiful they would be with their brilliant blue Cornflower-like heads.

September is its nominal time of flowering, but we cannot get it in bloom until much later, unless by growing it under glass in spring, and planting out then, lifting in the autumn, and flowering under glass. I do not care for either system, but if we wish to grow this beautiful Stokesia some such method must be adopted. S. cyanea comes from Carolina and other Southern States of America, and grows from 18 inches to 2 feet in height. The spatulate leaves, which are slightly hairy, are stem-clasping, and the flower heads which are large are of a deep sky blue. Were it not for the fault indicated—truly a grievous one—this would be one of the best of our garden plants.—S. Arnott, Dumfries.

MARGARET CARNATIONS.

THE above-mentioned Carnations are very useful for providing cut flowers. Ours were raised from seed sown in March, and when large enough the seedlings were pricked into pans filled with light soil. When sufficiently strong the young plants were placed singly into 60-sized pots, kept in a frame until established, and then put out of doors in a sunny position. They were subsequently shifted into 5-inch and 6-inch pots, using good loam with a little leaf mould and sand and a sprinkling

of horn shavings, making the compost rather firm.

When the pots were filled with roots the plants were fed with soot water and liquid manure about every third watering. They commenced flowering about the end of September, when they were placed on the shelf in the greenhouse. From about seventy plants we are able to gather an abundance of flowers every week.

We have tried the planting out system during the summer, but it did not answer half so well as keeping them in pots.—W. S.

SOME GOOD APPLES.

MAGNUM BONUM.

THIS is an Apple not much known, having flesh of the Golden Spire type. The fruit is quite conical in shape, skin smooth and of a deep golden yellow when ripe, at the end of September or early in October. In habit of growth the tree is upright, requiring but a small amount of space.

GREENUP'S PIPPIN.

I find that Counsellor, Yorkshire Beauty, and Red Hawthornden are simply synonyms of Greenup's Pippin. It is a pity that Apples almost a century old should be re-named, thereby misleading the inexperienced. Apart from this, however, I wish to call attention to the Apple under notice, not only for its good appearance, but for its quality as a cooking variety. I know of no Apple that when reasted preserves its form so well and is apparently quite hard, but it is, nevertheless, just the reverse. The flesh is white when cooked. In shape the Apple is faultless, having a smooth skin and a rosy cheek. For home use or for market this cannot fail to be a profitable variety to grow. It is in use in September.

KIRKE'S FAME.

This Apple is seldom mentioned in the horticultural press. According to Dr. Hogg in the "Fruit Manual" its proper name is Pomeroy of Herefordshire. After describing it, the above mentioned authority remarks that it is a very richly flavoured dessert Apple. With this description I quite agree. From its appearance I should say that the proper season for it is in October. It is an excellent cropper; the tree is of upright growth, not requiring much space, therefore all the more to be encouraged as a garden variety.

PECK'S PLEASANT.

This is an Apple not largely grown or widely known. The skin is of a russety dull red thickly covered with large white spots, which renders it somewhat remarkable in appearance. The eye is deeply sunken, the fruit rather flat. Altogether it appears to be an Apple worthy of extended cultivation.

CARDINAL

As an early culinary Apple for market this is to be recommended, coming to a large size at the end of August. In addition, its colour and perfect shape are sure to command a ready sale. The tree is a vigorous grower, the foliage is really handsome, so luxuriant is it. For a small garden Cardinal is just the Apple to plant, bush trees requiring but little space.

Cox's Pomona.

I would draw attention to this culinary Apple as a market variety. Not only is it a good cropper, but the colour which it carries is all in its favour. As a rule the colour spreads entirely over the fruit, and is less affected by non-exposure to the sun than the bulk of other sorts. With me the colour, streaks of bright crimson on a yellow base, is as much defined at the base as the apex.—E. M.

CYPRIPEDIUM INSIGNE VAR. ILLUSTRE.

THERE are many varieties of Cypripedium insigne now in cultivation, and these vary much in character. During the past few months three or four different forms have been adjudged awards of merit by the Orchid Committee of the Royal Horticultural Society, this number including the variety depicted in the illustration (fig. 83). This was exhibited at the Drill Hall, Westminster, S.W., by R. J. Measures, Esq., Cambridge Lodge, Camberwell, on Tuesday, November 28th. It is a very distinct kind, and attracted more than ordinary attention. The upper sepal is yellowish green, unusually heavily spotted brown, and has a well defined white tip. The netals are similarly marked, and the a well defined white tip. The petals are similarly marked, and the lip dark shining brown.

ORCHID LESSONS FOR YOUNG GARDENERS.

ROOTS AND THEIR REQUIREMENTS.

(Continued from page 550.)

Before pointing out the requirements of Orchid roots we must devote a few words to explaining in what respects they differ from those of most other plants, as a good guide is obtained in our practice if we understand with what we are dealing. In the first place, Orchids can be divided into two natural groups for the purposes of cultivation, as the requirements are very different. The largest group is that comprising what are termed "epiphytes" -namely, Orchids which are mostly found growing upon trees or other plants, or on decaying vegetable matter, and but seldom in the ordinary soil; the other includes the so-called terrestrial Orchids, which are commonly deciduous, losing their leaves and growths every year, dying down to a fleshy tuber, which remains under the soil through the period of rest. With the epiphytes Orchid growers are mostly concerned, and to them first attention must be devoted. The principal point that will be noted in considering these plants is that the roots are naturally seldom covered with much material, and this is of a light character, being formed of such decayed vegetation as may accumulate where the Orchids find a suitable spot for growing. As the plants are not parasites—that is, they do not derive any food support from the sap of the stems on which they live, it is therefore obvious the principal nourishment of the epiphytal Orchids must come from the rains and atmospheric moisture surrounding them. So it is that the roots perform two functions—one being to hold the plant in position, and the other to extract the requisite moisture from the air or some light substance, which shall not bury them deeply. As might be expected, the roots are very different from those of plants which derive their support from soil in the ordinary way. If examined they will be found to be comparatively thick and fleshy, free from the numerous minute fibres characteristic of other plants, while the roots produced on the stems, and therefore entirely exposed to the air, are frequently found to be covered with a whitish, ashen, or leaden coloured kind of bark, except the young tips, which are usually of a greenish tint, and the condition of these afford one of the most reliable indications of the health and activity of many Orchids, especially those producing large leafy stems.

Three cultural hints can be derived from the facts mentioned, first, that the roots being thick and fleshy are easily injured and not readily renewed, pointing to the necessity of great care in all operations; secondly, that very little material is required about the roots of the epiphytal Orchids, consequently it is a mistake to bury them deeply in large pots under a mass of close substance, excluding air from them, and leading to a sourness most antagonistic to healthy growth; thirdly, that gross nourishment is not required, but a regular supply of moisture, and that the appearance of the stem roots often gives us an excellent idea of the state of the plant.

In the case of the terrestrial Orchids the roots partake more of an annual character, for after each season fresh roots are produced, and the principal object of the cultivator is to encourage these to make free and rapid progress by a liberal supply of readily available food in a more substantial soil. Familiar examples of this class are afforded by the Calanthes of the vestita group amongst those grown under glass, and by Cypripedium spectabile amongst those which can be grown out of doors. The same fleshy moisture-loving character is, however, possessed even by these, and the only

temporary safeguard against carelessness is that the large pseudobulbs or tubers serve as storehouses from which the plant draws supplies in time of need.—Orchidist.

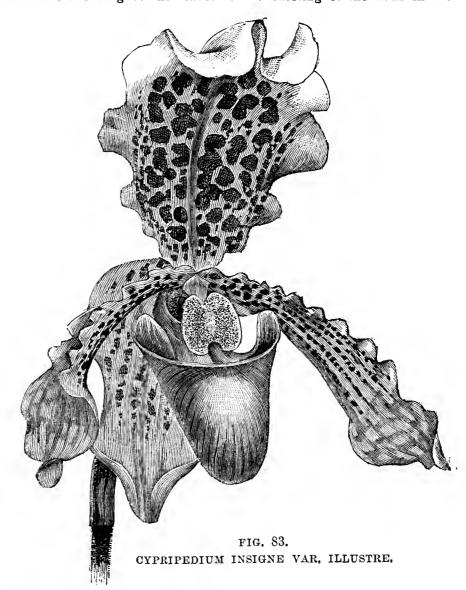

(To be continued.)

REMARKS BEARING ON FRUIT CULTURE.

HAVING received a letter from a correspondent, who is a member of a "Gardeners' Mutual Improvement Association," in which I am asked to answer five questions of a practical and very interesting kind; and in writing answers thereto, it occurred to me that the matter might prove as useful as it is opportune to readers of the Journal of Horticulture. The questions are given in my correspondent's own words, and are as follows:

(1), Is canker in fruit trees caused principally by the roots penetrating into bad subsoil, such as clay, sand or gravel? Yes; the principal cause of canker in fruit trees is the pushing of the roots into a cold, wet, poor, and perhaps, sour subsoil. Strong, vigorous growing varieties of the Apple worked on a free stock are rarely affected with canker.

(2), Are the roots of fruit trees (Vines in particular) under ordinary treatment inactive during the winter months? Practically, if not literally, the roots of fruit trees are inactive during the interval elapsing from the shedding of the leaves to the bursting of the buds in the

spring, or at any time that circumstance may occur under artificial treatment.

(3), Do the roots of the Vines start into growth before or after top-growth has commenced? I believe the roots of the Vine start growing generally after top growth has commenced. This is certainly the case where the roots are in outside borders, and I believe it is the fact when the roots are growing in inside borders too. The Vine grown under favourable circumstances has completed its functionary preparations for another year's work when it has shed its leaves, and so the plump well-ripened buds only await the necessary amount of increased light and warmth to push into growth in the spring in advance of root action. This is only reasonable, seeing that the temperature to say nothing about the great importance of light as a factor of growth—to which the top part of the Vine or tree is subjected, is uniformly

much higher than that of the soil about the roots.

(4), Is it beneficial to supply manure water to fruit trees just previous to their coming into bloom? It is most certainly beneficial to well water fruit trees with diluted liquid manure previous to their coming into bloom, then, or at any other time, always assuming that the condition of the soil about the roots is such as to render the application of water advisable. It is more important that the soil should not be allowed to approach the dryness at the period indicated than at any other stage (not excepting the time the fruit is stoning) of the tree's growth. Otherwise the fruit buds would be likely to drop.

Is it right when pruning fruit trees to cut "clean away" all growth (excepting leaders required for further extension of the trees) so as to leave no chance for any buds to start or form? No; certainly not. In the winter pruning of trees of the Apricot, Apple, Pear, Plum, and Sweet Cherry (the summer "pinching" having been duly attended to). all young lateral growths should be cut back to within one eye or bud of their bases. I am referring to established trees. In the case of young trees obtained from the nursery or home growers, every available shoot (excepting foreright shoots) should be spread out and trained regularly over the wall space, bending the strong unpruned leading growths towards the ground, and securing them to the wall in that position with nails and shreds, afterwards fastening the leaders thus operated on in their respective positions, and arranging the young growths over the intervening spaces. All the foreright shoots should be cut back to within one bud of their origin to induce and promote the formation of spurs and fruit buds. In the matter of hardy fruit culture, the main object should be to obtain large fruitbearing trees of approved varieties of the several kinds in as short a time as possible. Therefore, in starting with young orchard trees, the leading shoots should be pruned back to within 8 or 9 inches of their bases after they have shed their leaves in the autumn, and should the growths resulting from the shortened back shoots in the spring be likely to become crowded or to cross each other they must be pinched back to within 2 or 3 inches of their origin.—A FRUIT GROWER AND EXHIBITOR.

JOTTINGS FROM DUBLIN.

A JUDGING engagement took me to Dublin for a few days during the month of November. I determined to make the most use of the short time at disposal by inspecting the chief horticultural objects situated in or near the city. Gladly accepting the proffered guidance of an enthusiastic amateur horticulturist, a jaunting car was chartered. The first order the "jarvey" received was St. Anne's, the princely residence of Lord Ardilaun, situated some five miles east from Sackville Street. A telegram in advance made certain of finding Mr. Smith at home, who has had charge of these gardens for the last twenty-six years. A very pleasant hour was spent in his company.

Time did not permit of more than a cursory glance at each of the various departments, but sufficient was seen to show that high cultivation is the foremost object here. The first house we entered contained some well-grown winter flowering Carnations; White Cheer and Whipper In made a bright display with their scarlet blossoms. Mignonette for winter flowering is largely grown, the variety Machet proving to be quite as valuable for this season as it is for early summer. Cyclamens are more numerous and their wants better understood than I

had previously seen in any private garden.

A new and handsome structure is devoted to tropical plants, such as Palms, Bananas, Tree Ferns and the like, all bearing the stamp of good cultivation. In another house adjoining Crotons, Dracenas, and other similar plants suitable for house decoration are grown in large numbers, the demand for material of this class being a heavy one. Hardwooded plants are not neglected either. Camellias, Azaleas, Epacris and Heaths are admirably grown. Rambling freely under the roof in one of the numerous span-roofed houses, I noted a healthy plant of Bomarea Carderi, which is but seldom seen in private gardens. Orchids do not occupy a considerable space, but they have a healthy appearance. A very fine form of Vanda coerulea was flowering at the time of my visit. Forty guineas had been offered for one very small plant, so highly of was it thought by one of our greatest Orchid cultivators, so rich is it in its colouring. Cypripediums are well managed. Cattleyas, Lælias and Zygopetalums are also well represented.

In the fruit houses there was of course little to see, but judging from last season's growth the Peach crop must have been a good one. The Vines as far as could be judged from the appearance of the rods and buds give good crops of fruit, quality being the chief point aimed at and

obtained. Strawberries in pots are numerously grown.

Out of doors all departments are in keeping with the inside. Herbaceous plants are extensively cultivated. I was not a little surprised to hear that Salvia patens withstood the rigours of an Irish winter with but a protection of coal ashes, a layer being placed about the stems. As quite a dozen roots are growing in each clump the plants when in bloom must produce a good effect. Border Carnations are largely grown, they are mainly planted in wide beds in the kitchen garden, and rockery plants form a distinct feature. The best Yew hedges that I have seen are here, and some lessons in hedge-clipping could be had, so accurately is the work done. The square columns are 15 feet high, and many of the hedges are 7 feet, and in all cases these latter have perpendicular sides and flat tops.

Conifers and forest trees are not of particular merit, the situation being too near the sea and too much exposed to wind for luxuriant growth. Some perfectly formed specimens of Weeping Ash I noted by the side of the carriage drive. Evergreen Oaks were of uniform growth, the foliage being rich in its tone of colour. The general appearance of the place, which includes 60 acres of pleasure garden, reflected much credit on the able custodian, who is apparently held in great respect by his noble employer if one may judge from the handsome present of a silver tea service with suitable inscription, made him upon the comple-

tion of twenty-five years' service. After driving back to the city a change of guides took place, I being handed over this time to the charge of two enthusiastic

horticulturists, one as hearty and entertaining an Irishman as ever lived, as full of Irish wit and humour as the proverbial egg is full of meat, who could not if he tried have copied the "jarvey (who spoke hardly a word during the whole of the day), which to me was a surprise, as Irish "jarveys" were noted. I had been informed, for their volubility of tongue. Just one instance of my friend's native wit before I close this part of my jottings. Our spirited horse in going up a hill past the penal establishment took it into his head to turn suddenly and sharply round. The riding on an Irish car being new to me I was prepared for a jump upon the slightest sign of danger, which drew from my friend the remark, accompanied with a merry twinkle in his eye, "A sinsible man always sits still."

In my next I will refer to my pleasant visit to Mr. F. W. Burbidge at

the Trinity College Botanical Gardens.—E. MOLYNEUX.

THE WEATHER IN LONDON.—Bright and genial weather charactised Christmas day. With a clear sky four hours of sunshine were registered in Westminster, and there was an entire absence of rain in the metropolis until about nine o'clock at night, when it fell heavily for an hour or so. The temperature continued remarkably high for the season, the lowest reading of the thermometer during the night being 40°, whilst the highest in the day was 46°. Tuesday was also fine, but Wednesday opened dull, and as we are going to press a fog prevails.

- WEATHER IN THE NORTH .- With the exception of the 20th, which was a calm clear day, the weather has been disagreeable during the past week. There has been very little frost, but high winds and rain have prevailed, and there was a slight fall of snow on the morning of the 21st. Christmas Day was marked throughout by gusts of wind and cold showers. Tuesday morning was dull, but so far fair and calm. -B. D., S. Perthshire,

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The fifty-fifth annual general meeting of the members of this Institution will be held at "Simpsons," 101, Strand, London, W.C., on Wednesday, January 17th, 1894, at 3 P.M. The meeting is called for the purpose of rcceiving the report of the Committee and the accounts of the Institution, electing officers for the ensuing year, and other affairs; also for the purpose of placing fifteen pensioners on the Fund. The Committee request that all unpaid subscriptions for the year 1893 be forwarded to the Secretary, Mr. G. J. Ingram, at the office, 50, Parliament Street, S.W., before the 31st inst., the date on which the financial year of the Institution closes.

- WE have received Part 20 of the "DICTIONNAIRE PRATIQUE D'HORTICULTURE ET JARDINAGE," published by M. Octave Doin of Paris, and which is edited by MM. Mottet, Vilmorin-Andrieux et Cie, Alluard, E. André, G. Bellair, G. Legros, &c. It professes to be a French translation of "Nicholson's Dictionary of Gardening," but in many respects is quite a different work, both in the letterpress and the illustrations. To those who understand the French language it will be a most useful work, and we commend it very highly to those who are able to make use of it. We have not received Parts 17, 18, and 19.

"INDEX KEWENSIS."—"A. C." writes :—Relative to the notice of the "Index Kewensis" in the Journal of Horticulture (page 553), may I offer a free translation of the very forcible Latin couplet?

> Opus est hactenus sine pari Opus est quo, nullus carere potest. A Work, so far, quite peerless beyond doubt! A Work, this is, which none should be without!

- THE ST. BRIGID ANEMONES.—Mr. S. Arnott observes :—These beautiful Anemones can hardly be overpraised, and as one who has grown them for a number of years, and has often wished to know who "St. Brigid" is, I have been much interested in Mr. Burbidge's article on page 504. In mild seasons I cover a small bed with a frame, and am thus enabled to cut flowers occasionally throughout the winter. The method recommended of sowing the seed in March or April is an excellent one for autumn and winter flowering, or for gardens where the Crown Anemone does not succeed permanently planted.

—— LUCULIA GRATISSIMA.—Half a dozen plants of this Luculia were planted eighteen months ago in a border composed of loam three parts, the remainder leaf mould and peat in equal portions, with a little sand and charcoal added. They are trained against the wall of a large conservatory, and are now in flower, emitting a very sweet perfume. The flowers fade quickly after cutting if the stems only are placed in water, but if picked in rather small pieces and allowed to float in a bowl of water they keep fresh for a much longer period, and are a welcome addition at this time of year.—W. S.

— CRYSTAL PALACE FRUIT SHOW.—I should like to add a few words in support of the suggestion of "H. W. W." (page 508), which has been so fully endorsed by "An Old Exhibitor" (page 531). No matter what shows are held in that grand monument to Sir J. Paxton's memory, whether they be of Rose, Fruit, or Chrysanthemums, exhibitors and public alike speak in high terms of the effectiveness of the arrangements there. It is therefore much to be regretted that the great annual Fruit Show should have been discontinued during the last two years, and I join with other exhibitors in expressing the hope that the Crystal Palace Directors may be induced to resuscitate their September Exhibition. An excellent and practical method of approaching the Directors is suggested by "D." (page 531), and I entertain a firm belief that if "H. W. W." and the Editor will undertake the task their appeal on behalf of British fruit growers will not be made in vain.—A MIDLAND COUNTIES FRUIT GROWER.

—— SUNLIGHT SOAP COMPETITIONS.—Gardeners who make a practice of exhibiting usually regard competitions as a stimulus to the routine of everyday life, and as a deviation from these the "Sunlight Soap Competitions," inaugurated by Messrs. Lever Brothers, are worthy of notice. Particulars of these competitions are given in our advertisement pages. The enterprise of the proprietors of this domestic necessity has developed a world-wide trade.

—— RIPENING GREEN TOMATOES.—Compared with the customary methods in this country, some ideas of our transatlantic cousins appear strange, as witness the following:—"Among various plans for ripening green Tomatoes which are usually found on the plants when frost kills them, the 'Florists' Exchange' gives the advice to spade up a piece of ground which is protected on the north side, then pull up the plants with the fruits, spread them over the newly spaded ground and cover them with straw, leaves, corn stalks, or anything which is most convenient to keep them warm at night. The heat of the earth will ripen the fruits perfectly. The fruit does not wilt, and the flavour will be as good as if it ripened in the sun." Has any British Tomato grower tried this method?—A: B. C.

- ROOM PLANTS.—There are few plants of any description grown in pots that are of greater value at this time of the year than are those evergreens that will do well in fairly cool rooms, yet from which frost is excluded. By evergreens I do not mean shrubs, but Palms, Ferns, Aspidistras, Dracænas, Indiarubber, and Asparagus, all of great beauty now because decorative plants in cool rooms are scarce. I have in a room looking west a Kentia Fosteriana that was given me last spring. It is some 30 inches in height, and is in perfect condition. Other smaller ones are growing and doing well. Dracæna indivisa 2 feet high, is excellent, so also are variegated Aspidistras, which I obtained six months ago, and are as good as ever, perhaps better. The Adder's-tongue Fern does so well because its fronds clean so admirably. This, however, may be said of many others. I have a plant, dug up from a ditch in the New Forest some three years since, that does capitally in a room, and a more recent addition is a well-seasoned clump of Asparagus plumosus nanus, so fragile looking, so graceful, and yet so admirable for room culture, indeed one of the best. I think a cool room, in which fire and gas are used but once a week, is much better than is a room more frequently heated. It is true we have not had much frost so far, and the winter has been very favourable, still should the weather prove hard a little artificial warmth can easily be furnished. That there are many of these good green or variegated plants in cultivation, of which little as to their domestic usefulness is known, there can be no doubt. I am not referring to plants that are kept in rooms for a week, then out again; I write of those that will nearly always, but especially for several months, keep fresh and growing. What an interesting thing would be a competition at the Drill Hall of three, four, or six plants grown in pots in living rooms for a period of six months previously, having windows only to furnish light and air. That would be something novel in the way of plant exhibits.—D.

—— ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—The flower shows of this Society will be held in the Waverley Market, Edinburgh, on Wednesday and Thursday, 4th and 5th April; Wednesday and Thursday, 11th and 12th July; Wednesday and Thursday, 12th and 13th September, 1894.

—— PARONA PANICULATA.—An American contemporary eulogises this Parona, and says it is an annual fast-growing, twining, high climbing, downy plant, with ample much-branched panicles of small, somewhat tubular, white flowers. The leaves are cordate, $2\frac{1}{2}$ to $3\frac{1}{2}$ inches long, smooth above but downy underneath, and rather suggestive of those of some of the small-leaved Aristolochias.

— London Gardens. — A correspondent writes:—Apropos of the interesting articles by "J. R. S. C." (pages 526 and 550) the following clipping from a recent number of the "Nincteenth Century," may be worth reproducing:—" London alone has, since the formation of the Metropolitan Public Gardens Association in 1882, increased her open spaces by 157, containing 4998 acres, while the entire number of public parks and gardens within easy reach of the inhabitants of the metropolis is 271, containing 17,876 acres, which include 6380 acres acquired and maintained by the Corporation of the City of London. We may roughly say that the cities and towns of the United Kingdom, including the metropolis, possess some 500 open spaces over 40,000 acres in extent."

DEATH OF MR. GEORGE THORPE.—We regret to learn from the American papers of the death of Mr. George Thorpe, the youngest son of Mr. John Thorpe, which occurred on the morning of November 23rd. For three weeks previous Mr. Thorpe had been confined to his room with typhoid pneumonia. He was twenty-one years of age, and was identified with his father in the latter's position as Chief of Floriculture at the World's Fair. The illness that caused his death was induced by exposure while attending to his duties at the Fair. He was in the habit of reaching the grounds every morning at four o'clock, and he often remained there until late at night. Mr. Thorpe was a promising young man, of a genial disposition, and made many warm friends. The funeral services were attended by numerous friends and societies, who followed his remains to Oakwoods Cemetery. The Chicago Florists' Club, of which he was a member, attended in a body.

- SHROPSHIRE HORTICULTURAL SOCIETY.—The annual meeting of this Society was held on Monday, the 18th inst., when there was a good attendance of members. His Worship the Mayor (W. L. Browne, Esq.), was voted to the chair. Mr. W. W. Naunton (one of the Hon. Secs.), read the annual report of the Committee, which included the following:-" The continued success which attended the exhibitions of the Society during the present year is a matter for congratulation, but there is nothing which calls for any special remarks. The accounts will be found very satisfactory, showing a profit for the year of about £850. Arrangements for 1894 are in progress, and there is every reason to hope that with the usual kind co-operation of the railway companies and the corporation, the previous successes of the Society will be fully maintained." Mr. W. Phillips (one of the Hon. Treasurers) then read the statement of accounts. In the statement for 1893 the receipts included: Interest on invested capital £110 9s.; subscriptions received, £404 18s.; cash taken at Spring Show, £15 13s. 9d.; received for rents, £57 19s. 6d.; cash for refreshment contracts, Summer Show, £354 18s. 9d.; takings at gate, first day, £504 15s. 8d.; second day, £1459 6s. 2d.; cheap tickets sold by Messrs. Adnitt & Naunton, £496 163. 10d. Total receipts for the year, £3631 12s. 5d. The disbursements included: -Spring Show expenses, £85 11s. 10d.; prize money, Summer Show, £645 11s. 6d.; sports and fireworks, £455 5s.; horse leaping, £101 5s. 3d.; bands; £286 18s. 9d.; hire of tents, gas, enclosing ground, &c., £321 19s. 3d.; printing, £143 11s. 7d.; advertising, £156 16s. 9d. The balance carried: forward is £694 3s. 8d. The statement showing the actual position of the Society was read as follows: -To balance as per last balance sheet; viz., at banker's on current account, £761 4s. 9d.; on deposit, £500-£1261 4s. 9d.; balance in hand on 1893 accounts £694 3s. 8d.; amount transferred from deposit account to current account, £1750; amount invested on Kingsland Bridge Debentures, £1000; investment on Police Station, £500. Total, £5205 8s. 5d. By amount paid for fields and gardens purchased from J. L. Burton Esq, £3150; paid for valuation? £10 17s. 6d.; solicitor's charges (half legal fees) £33 15s.; deposit on Circus Fields and other property £230; balance in banker's hands, £280 15s. 11d.; Kingsland Bridge Debentures, £1000; Police Station investment, £500. Total, £5,205 8s. 5d. It was subsequently remarked that since its inauguration the Society has contributed £5000 towards the charitable institutions of Shrewsbury.

— COLONIAL GARDENING APPOINTMENTS. — We are informed that Mr. H. J. Davies, who for some time past has been sub-foreman of the Orchid department at the Royal Gardens, Kew, will shortly leave England for the Calcutta Botanic Gardens. Mr. J. Ward, also from Kew, goes out as Curator of the Magpur Gardens in the Bengal Presidency. Mr. H. Millen, after a six months' holiday, has left England once more for the Lagos Gardens, of which he is Curator.

— IVY UNDER TREES.—Mr. E. Molyneux writes:—The best example of utilising Ivy for covering the ground under large forest trees, where but little else would grow that I have seen, is at Dove Park, Woolton, a suburb of Liverpool. A width of about 15 feet on each side of a long winding carriage drive, planted with Beech, Sycamore, and Lime trees, is covered quite thickly with Irish Ivy, making a charming green carpet fully 1 foot thick. True, the trees are not furnished with branches very near the ground, which is all in favour of the Ivy. One would think that the leaves falling from the trees would have an untidy appearance amongst the Ivy, but such is not the case; they seem to be thoroughly hidden by the Ivy covering. Mr. Carling told me that they always throw the leaves among the Ivy when cleaning the drive. In time they decay, and act as a surface dressing and manure for the Ivy. Examples of this kind are well worthy of imitation, the result being so satisfactory.

- BANANAS.—The Banana is not nearly so largely cultivated in English gardens as it deserves, one chief reason being the amount of space required when given full root room. We have had six plants of Musa Cavendishi growing in a bed 12 feet long by 6 feet wide, and about 3 feet 6 inches deep, in a compost comprising good turfy loam and decayed stableyard manure. When planted on April 1st, 1893, they had scarcely any roots, but by shading and frequently syringing the plants have attained enormous dimensions, and are all carrying tremendous clusters of fruit. One plant measures 3 feet in circumference at the base of the stem, and is carrying a bunch 3 feet long, and thickly packed with fruit. The other four measure from 2 feet 8 inches to 3 feet at base of stem, and are carrying bunches of similar dimensions. We cut one bunch about the 25th of November weighing 130 lbs., with 186 fruits on it, which we have been using for dessert. The plants have been watered occasionally with liquid manure, and assisted by night with a gentle fire heat. The remaining fruits are swelling fast, and promise a long lasting supply for dessert.—ARTHUR SMITH, Foreman, Knightshayes Court.

- ROYAL METEOROLOGICAL SOCIETY .- The monthly meeting of this Society was held on Wednesday evening, the 20th inst., at the Institution of Civil Engineers, 25, Great George Street, Westminster, Dr. C. Theodore Williams, President, in the chair. Mr. C. Harding, F.R.Met.Soc., gave an account of the "Great Storm of November 16th to 20th, 1893." This storm was the most violent of recent years, and so far as anemometrical records are concerned, the wind attained a greater velocity than has previously been recorded in the British Islands. The velocity of the wind was ninety-six miles in the hour from 8.30 to 9.30 P.M., November 16th, in the Orkneys, where the hurricane burst with such suddenness that it is described as like the shot of a gun; and the wind afterwards attained the very high rate of ninety miles and upwards in the hour for five consecutive hours. At Holyhead the storm was terrific. The anemometer recorded a wind velocity of eighty-nine miles in the hour, and it was eighty miles or above for eleven hours; while the force of a whole gale, sixty-five miles an hour and upwards, was maintained for thirty-one hours, and for four and a half days the mean hourly velocity was fifty-four miles. Many of the gusts were at the rate of 115 miles an hour; and at Fleetwood a squall occurred with the wind at the rate of 120 miles in the hour. The storm was felt over the entire area of the United Kingdom, and the wreck returns show that disasters occurred with almost equal frequency on all coasts. Four weeks after the storm the official records gave the total loss of life on our coasts as 335, while there were 140 vessels which had been abandoned or had foundered, stranded, or met with other severe casualty, involving either loss of life or saving of life by some extraneous assistance. There were 600 lives saved on our coasts by aid of the Life Boat Institution and other means. The author has tracked the storm from the neighbourhood of the Bahamas on November 7th across the Atlantic and over the British Islands to Central Europe on November 20th. The other papers read were "Rainfall and Evaporation Observations at the Bombay Waterworks," by Mr. S. Tomlinson, M.Inst.C.E.; and "On Changes in the Character of Certain Months," by Mr. A. E. Watson, B.A., F.R. Met. Soc.

Rose, Mrs. W. C. WHITNEY.

For the accompanying illustration (fig. 84) and description of this charming Rose we are indebted to "Gardening." Says our excellent transatlantic contemporary:—"This is a vigorous Rose of the American Beauty stamp, raised from seed by Mr. John N. May of Summit, N.J., who describes it as a Hybrid Tea. Its parents are Souvenir d'un Ami crossed with American Beauty. The flower is large and heavy, the colour is a deep clear pink, and the fragrance is delicious. It was obtained after several years' trial to obtain the same result. Seedling Roses are very difficult to raise. Oftentimes when desiring to reach a certain point the conditions are so that the seeds either fail to set, or after they have set and matured, fail to germinate; this was the case in this particular instance. Finally, however, success followed our efforts, and the Mrs. W. C. Whitney Rose is the result. It is one of the freest flowering Roses in existence, and it has handsome, heavy foliage."

CLASSIFICATION AND PROTECTION OF ROSES.

ALL your numerous readers at all interested in Rose growing eagerly read with pleasure all that "W. R. Raillem" sends to "our Journal." On his contribution in last week's Journal (page 559) I wish to make a few remarks. In my opinion there is no sure resting place for the classification of modern summer and autumn flowering Roses other than that of Hybrid Perpetuals. They are so much interbred that no other designation is true or logical in my opinion. Let any rosarian judicially consider the leaves and wood of Elith Gifford and Comtesse de Nadailac, or even Ernest Metz, and if they can, avoid the conviction that they are not pure Teas, but hybrids. And fancy the perpetual Gloire de Dijon being classed with Niphetos or Adam! Even a pure Bourbon is a "Hybrid Perpetual," we might add where needed, of "Tea stain" or "Bourbon strain," but Hybrid Perpetuals is the proper classification.

As to protection, burnt rubbish in a mound of 6 inches and then stable manure I have found best for some thousands of plants.—S. S.

PROTECTING TEA ROSES.

MR. GRAHAME, and other suburban Rose growers, if they have no leaves for the protection of their Teas, may yet congratulate themselves that they have not, in the large trees so often thickly present in country gardens, one of the greatest obstacles to the successful culture of the Rose, and they should also remember that walls and buildings which drop no seeds have no robbing roots, and refract and increase the heat, are the very best shelter against the wind, and are even in some small degree a protection against wind-frosts. If actually in the smoke-circle of a large town, no doubt watering, syringing, and even sponging of the leaves are sometimes processory.

of the leaves are sometimes necessary.

"R. M. D." (page 559) may rest assured that I have not only no objection to "slightly disturbing the surface," but even regard it (by means of a hoe, not a fork) as perhaps the most important point in what may be strictly called the cultivation of the Rose. But as I said last week, I do not at all know how manure can be got into the ground with a fork by only slightly disturbing the surface. I can further assure him that I am most serious in recommending leaves as the best protection from frost. That they are efficient I have thoroughly proved in the past hard winters, and recent correspondence in the Journal has shown how they even keep Apples in the open in good condition. I recommend their being placed in, around, and among the dwarf Teas 18 inches to 2 feet in depth, when they probably generate some very slight heat in themselves. It will be found that they do not blow away, the low thorny branches holding them. We have had severe gales from every quarter during the last few weeks; trees, chimney-pots, and palings have been blown down, but my Tea Roses are as well protected as before.

protected as before.

Let "R. M. D." examine any low thorny bush not under shade, but in an open field, provided there be trees any distance off in the hedges. Instead of the leaves having been blown away from the bush during the winter, he will find that they have been blown into it, and remain there thick and deep till the spring. He will also see, if he looks to page 540, that I said "the great bulk"—not all—"of the leaves fall in ten days or a fortnight." I think if "Practice" (page 559) had had practice in growing Tea Roses in low-lying ground in the eastern counties, he would certainly have had great losses during the past few winters if he had not protected his plants with the greatest care and precaution. He alludes to Magnolias: my plant has stood unprotected during the last eight years, and has suffered no harm whatever during winters which have sometimes swept away my Tea Roses, in spite of all my protection and care.—W. R. RAILLEM.

BLUE ROSES.

THE late Mr. Laxton, in reply to an inquiry I once made of him in the columns of the Journal of Horticulture, wrote—"A yellow Perpetual ought long since to have been evolved from Lyons or the sunny South. Now, however, that Rose-crossing in earnest is being taken up with skill, judgment, and the best appliances in this country and the United

States, I shall be a dishonoured prophet if we do not secure during the next decade not only a yellow but a violet and a white A. K. Williams.' This was in 1882. Our progress has not been what Mr. Laxton expected. We have had some admirable, I dare not say English, but United Kingdom Roses, not, however, what were predicted. A yellow H.P. did appear with a flourish of trumpets, but it is at present white. A violet A. K. Williams may come at any time, but we are no nearer to a sky blue Rose.

I have lately had the advantage of a conversation with the prime mover in the home of those wonderful Cinerarias, Cyclamens, and Primulas, which originate at Reading. He has described to me the birth of a blue Primula. A similar close attention to Nature, watching and adapting it, if it could be obtained, would surely bring about a blue What I gather is that white flowers, and to a certain extent pale blue, are a sign of weakness of constitution, and may come from adverse circumstances. The colouring matter in flowers is affected

by temperature, dryness, soil, and other recondite

causes. The Bride has a green tinge, I think, peculiar to its white, which if cultivated might lead on to something; but Mr. Martin considers a tinge of light blue more likely to be found in some of the other white Teas, the less robust ones rather than anywhere else, and that, if this could be obtained and followed, the colour required might gradually be procured. At the same time it must be admitted that possibly, in the eyes of some people, this flower if produced would be like that horse of notoriety, which was very difficult

caught worth only little. I may remark, speaking of comparatively Roses, that with new me Margaret Dickson has proved a remarkable climber, giving shoots 10 feet long even during the drought of the past summer.—A. C.

to catch, and when

HYBRID TEAS.

I COULD not help thinking of the quota-tion, "That in the captain's but a choleric word, which in the soldier is flat blasphemy," when I read the very true and pun-gent remarks of "W. R. Raillem" on the subject of Hybrid Teas in the Journal of last week (page 559), and it certainly caused a grim smile to flit across my face. I note that "W. R. Raillem," with due with due

discretion, got the assent of the Secretaries of the National Rose Society to his stating his views, and that he thinks, as I do, that "the catalogue always has been open to criticism." Some time ago I had the temerity to tell one of the Secretaries that I intended to criticise the new catalogue, as I considered it teemed with errors in wrong descriptions, and also that there were notable omissions. reply I received from him was that, having been a member of the catalogue Committee, it would be "presumption" to criticise my colleagues' work!

Having explained my quotation, I add a few comments. The Hybrid Tea class, as I said in the discussion on this classification at the annual meeting, is one of the worst blunders the Society has ever committed. Even the Rev. W. Wilks, the Chairman of the annual meeting, who looks, with good reason, on La France as "the Saul" amongst Roses, was unaware till I drew his attention to the fact that La France was now termed a Hybrid Tea. This year it was debarred from exhibition at the Earl's Court Show as a Hybrid Perpetual, and, as a matter of course, it could not be shown as a Tea Rose. Could the height of absurdity further go? The Hybrid Tea classification has simply been, and is, a mistake, and as "W. R. Raillem" tersely puts it, is inconsistent. As to the general opinion on its value, except by the few who introduced the division to the Society's arrangements, I have never heard anyone outside the Committee say a word in its favour, and one of our Secretaries has been throughout a consistent opponent of it; yet in this year's report it is referred to as if the arrangement had met with general and favourable acceptation.

A novice in Rose-growing who had heard of La France, Viscountess Folkestone, and Grace Darling as being amongst desirable Roses to grow, and being told they were not Tea Roses, would be puzzled on searching in some catalogues which follow the N.R.S. arrangement, not to find them mentioned in the great H.P. division. I notice that one of our greatest growers and exhibitors has in his catalogue this year, probably in despair, mixed up all his Roses, merely giving those he rows in alphabetical order, and denoted them by the initials H.P., T., or H.T. The plan he adopts seems a good and useful one, as experienced rosarians know all about the divisions, and those who are

inexperienced do not want conundrums when they are looking for

names of Roses.

I hope "W. R. Raillom" will further follow likely to be permanent." alteration the "open classes, the beautiful exhibits-J. GRAHAME, Croydon.

P.S. — To show the estimation in which the new Hybrid Tea class is held, I may mention there was not a single entry made in the class specially reserved for them at the Crystal Palace Show this year.

MANURING AND TRANS-

ANY remarks in connection with the subject of Rose culture from the fluent pen of "W. R. Raillem" are always interesting and original, and beneath the spirited style of a free lance lurks much information

up his criticism, as I am quite of his opinion that the new classification is "unsatisfactory and un-Unless Mr. Frank Cant's wording of the rule about H.T.'s had been accepted at the annual meeting there would have been grave dis-satisfaction, as the other suggested would have caused the practical disfranchisement of several of our most beautiful Roses in result which would be deplorable in view of of La France, for instance-which are usually sent by some of the great rosarians to our exhibitions. — CHARLES

-C. J. G.

PLANTING ROSES.

which is sound, though perhaps not always practicable. I can fully appreciate the force of his remarks on page 540, even though I form the target for his well-aimed shafts, which though they hit do not penetrate, because I can bring forward sounder reasons in support of the practice I advocate than your correspondent has yet advanced against them. My experience is altogether at variance with the idea that "it is a mistake to try and make a top-dressing of manure in winter act as both food and protection—as a manure and as a mulch." From a theoretic point of rious Ladauthan point of view I admit the most economical way of employing manure is to cover it with soil as soon as it is spread upon the land, so that as decay takes place the whole of its nutritious properties are absorbed by the soil; but our object in manuring Roses in the autumn is to give them protection and food in one operation. Of the soundness of this practice I am thoroughly convinced after trying various plans, especially during the last few years, during which time our winters have surely been severe anomaly anomaly and the severe anomaly anomaly anomaly are surely been severe anomaly anomaly anomaly anomaly anomaly are surely anomaly anomaly anomaly anomaly are surely as a severe anomaly anomaly anomaly anomaly anomaly anomaly are surely as a severe anomaly anom

been severe enough to prove a fair test. Although we are situated in a cold district of the Midland counties, the only extra protection any of our Roses receive during the winter is a muching of manule as previously advised. The tender varieties of Teas are planted only in sheltered positions or against walls, and our

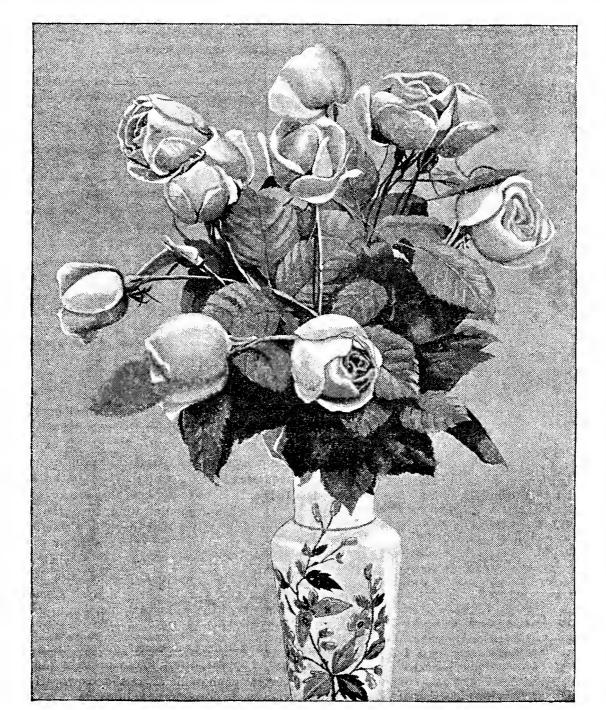

FIG. 84.—ROSE MRS. W. C. WHITNEY.

loss through frost is not more than 3 per cent. Let this, therefore, suffice as to the wisdom of giving manure as a mulch. Now, in regard to giving it in the autumn as a food. "W. R. Raillem" asserts that some good will be done by the rain permeating the manure, but not I maintain that a vast amount of good is the result, so much so, that I find no difficulty in maintaining the fertility of the soil to as high a state as is desirable by following the practice, because it is always advisable to give extra stimulants in the way of liquid and artificial manures during the growing and flowering periods. If, then, the matter is satisfactory from both points of view, why incur the labour of giving a rough mulch, which requires removal in spring, so that manure may be applied? The only advantage to be gained is a slight economy in the matter of manure. This is of little consequence in our own case, as we have unlimited supplies of manure, but labour is a matter for far greater consideration.

I will not, however, rely entirely upon my own experience in this matter, so I search to see what that successful rosarian the Dean of Rochester has to say upon the subject. In his "Book About Roses" (page 65) I find this significant passage: "The season when manure is applied is also a material circumstance. I have made many experiments, but I have come back to the plan which I adopted first of all, and I believe it to be the best-namely, to give the Rose trees a liberal stratum of farmyard manure in November, leaving it as a protection as well as a fertiliser through the winter months, and digging it in in

March."

"W. R. Raillem's" graphic description of the difficulties attending the simple practice of forking manure into Rose beds at springtime are rather imaginary than real. Three inches of manure put on during autumn or winter would by the action of rain and frost be reduced to little more than half that thickness when the time for forking over the beds arrived. A good workman would accomplish the task quite easily, without injuriously affecting the surface roots, and would have sufficient common sense to remove any very rough portions which could not be easily forked in. I am not one of those gardeners who are afraid to touch a root, as I consider the little damage done to them in the operation of forking in manure is altogether overbalanced by the great benefit both soil and roots derive from the admission of sunlight and air. This is the everyday teaching of both science and practice. I have now to deal with the concluding portion of "W. R. Raillem's" criticisms, in which he clearly shows that his knowledge of trees and their habits is so superficial as to proclaim its own weakness, otherwise the remark that the "great bulk of leaves fall in ten days or a fortnight" would scarcely have crept into print, because the time during which the bulk of leaves fall depends upon how great a variety of trees a garden contains, and the amount of wind or frosts which we experienced during the autumn. We have numbers of Sycamore trees which cast their leaves in shoals by the end of September or early in October. By the middle of November Oak and Beech are doing the same thing, and between these two dates they are continually falling in fluctuating numbers.

To a rosarian who is lord of his own domain it perhaps matters but little when the leaves are swept up, but how many head gardeners would keep their positions if they acted on this principle, just at the time when large house parties are the order of the day? But even if through the tolerance of their employers they managed to do this the green slimy condition of the walks, which would be the inevitable result, would require more expenditure to put them right again than would be incurred in daily sweeping.—A LOVER OF ROSES.

NOTES ON PEARS.

A VERY interesting communication was that by Mr. Abbey on "Fertilising Pears," page 506. For many years past I have devoted some attention to the question Mr. Abbey brings forward, and with the greatest possible good. Especially have I found it so on our arch of espalier-trained trees, which is about 120 yards long, nearly all the trees being over forty years old. I commenced the operation through observing the great scarcity of bees in some seasons over others whilst the trees were in blossom, and after the fruit was set the great number

of deformed fruit which were to be found on these old trees.

I had considered the free-setting qualities of some varieties to others, and came to the conclusion that much might be done in assisting fcrtilisation; but the camel-hair brush was too tedious a practice on these old trees, and to limit the time to the lowest possible minimum a rabbit's tail was procured, tied to the end of a long stick, and the work was speedily performed, with such good results that I have followed the practice now for the past seven years. To enter into details on the varieties would only be to make a repetition of most of those which Mr. Abbey has enumerated. One more word to say that with us Beurré Diel, planted against a south wall in soil 2 feet from the solid clay, is of very good flavour; but if Mr. Abbey could (and I know of no one more qualified to give an opinion, judging from the active researches in which he is always engaged) tell me why Beurré Diels crack in wet weather as well as dry I should esteem it a great favour, for we suffer from this evil to a great extent with our bush trees of this variety.

Never has the lesson of gathering Pears at intervals been placed before us with such a certain measure of success, and to keep up a good supply it cannot be ignored. We commenced with Citron des Carmes, which was almost useless. Williams' Bon Chrêtien and Jargonelle were good, but soon over. Beurré d'Amanlis was conspicuous by splendid fruit, and the quality really good. I join hands with "Northerner"

(page 495) in praise of Pitmaston Duchess. It has cropped well, been of good flavour, and so far from using it for stewing, regret was expressed when they were not forthcoming any longer for dessert. Glou Morçeau we are now using, and it is superior in flavour to those of former years. Doyenné du Comice has been good in every way, a point in its favour, having at the recent Liverpool Show the first and second prizes awarded to it for a single dish of ripe Pears. Easter Beurré and Beurré Rance are keeping well, the latter coming good in certain seasons. I agree as to the worthlessness of Beurré Clairgeau and Beurré Bosc for dessert. When well grown they are handsome fruits, but we only use them for stewing. Prince Consort I have once remarked upon in the Journal. The tree is a good grower and cropper with us, fruit of large size, pale russet and green spots, a grand keeper, and the most juicy Pear in cultivation. It is the one of all others for invalids, not being too sweet as in such varieties as Fondante d'Automne, or with the musky aroma of Nec Plus Meuris. In this precarious season there has not been a fault to be found with it.—R. P. R.

JUDGING AT EDINBURGH.

In answer to Mr. Robert Laird (page 530), I have to say-1, Regarding the appointment of an expert officially. The fact is that an expert" did point the four stands in question; not only so, but in my hearing Mr. Laird gave the expert instructions to proceed, as he was doing, in the pointing of the blooms, and to hand him the results after he had finished. The figures as appearing at page 503 were presented to the Secretary, and I also was presented with the same figures in the handwriting of the gentleman who pointed the stands, the document containing the said results being now in my possession, with the signature of the expert subscribed. Will you be surprised that I inferred that the said expert had an official standing? If I was mistaken in drawing this inference, I beg to express my regret, and accept Mr. Laird's denial on this head.

2, Regarding the second denial of Mr. Laird, I am much surprised to learn that he denies the acknowledgement of the misjudgment. I am strong in the recollection of his explicit statement of the error in the judgment, and immediately on his acknowledgement of the error I requested him to send the fact to the Press, but this he refused to do. It is only right to say here that the acknowledgement was verbal.

I had a communication from the Secretary, dated the 21st of November, stating that they (the Committee) "have no power to ask the Judges to show how they arrive at their conclusion in any case of dispute." There was no reference whatever in this communication from the Secretary as to any confidence being reposed in the skill and integrity of the Judges, which he seems to indicate was part of the contents of the said communication to protestors. - WILLIAM RUSHTON, Cochno Gardens, Duntocher.

We believe our correspondent wrote in good faith. He did not, it would appear, discriminate between the private and official capacities of some of the officials of the Show. He is not to be blamed for the step he took under the circumstances, as he was not the cause of the misunderstanding and disquietude. The "expert" informs us that if he had pointed the blooms the first day the points would have differed still more widely from the official awards. He was desired, but not officially appointed, to examine the collections.]

GRAFTING CHRYSANTHEMUMS.

EXPERIMENTS in grafting the Chrysanthemums on stocks of Anthemis frutescens have been highly successful in various localities this year. According to the "Garden and Forest," a specimen of the variety Val d'Andorre, exhibited at Brussels last month, measured 9 feet in diameter and bore 783 flowers. Other grafted varieties did not make such large bushes, but bore numerous flowers of great size and of unusually deep colours.

MRS. JAMES CARTER.

The value of this small flowered Japanese variety for decoration in a cut state is becoming more apparent, judging by the number of it seen in bouquets, baskets, vases, sprays, and fan-covered decorations at shows. The small thread-like florets, creamy white in colour, associate so well with other flowers other than Chrysanthemums. When the plants are cultivated to produce an abundance of blossoms in preference to fewer but larger specimens many of them are not more than 2 inches in diameter, which renders them all the more suitable for the form of decorative use to which they can be applied.

COMTE F. LURANI.

Apart from its value as an exhibition variety in a cut state, this is one of the best for grouping purposes. Really good blooms are produced upon plants under a yard high, which dispenses with the necessity of following the "cutting down" system to obtain dwarf plants. As a decorative plant, the stems being thickly clothed with dark green leaves, coupled with the semi-drooping character of the florets, it is difficult to The colour of the flower is a warm rose, frosted white, which gives it a novel yet pleasing appearance.—E. M.

ELSIE AND BUTTERCUP.

CULTIVATED in bush form with a view to produce a large number of cut flowers either for use in a cut state or as plants for the conservatory these are two excellent varieties. The former belongs to the reflexed The blooms are not of extra size, but quite large enough; the tips of the flat florets droop gracefully. In colour the blooms are pale yellow when opening, passing with age to a deep creamy white. This variety also makes a good trained specimen plant.

Buttercup is a single-flowered variety, in colour rich yellow, as its name implies. The florets are nearly erect, forming a cup-like bloom.

The growth is vigorous, and wonderfully free in flowering.

CHRYSANTHEMUM AMERICA.

This is a single-flowered variety, possessing considerable mcrit from a decorative point of view. That such a beautiful sort should have escaped attention so long is a matter for surprise and regret, and this remark holds good in reference to single varieties generally. I cannot say whether it is usually so late in flowering as it is with us this season; if so it would be a valuable addition to the Christmas display. It is now at its best, and arrests attention more quickly than any other in the house. The flowers are comparatively large, the florets wavy and narrow, and the colour a delicate shade of blush pink relieved by a yellow disc. For arranging in vases I know of few flowers so effective, and to see it at its best it ought not to have any other association, except perhaps some foliage of an approved kind. It does not appear to be so free as some varieties in supplying cuttings, nor is its constitution so vigorous, but its graceful blooms compensate any other failings.— W. S., Rood Ashton.

ABOUT ONIONS.

THAT pest, the Onion maggot crops up in all directions. "Nothing has given me so much trouble as the Onion maggot," said a gardener to me the other day; and he did but say just what is in the minds of thousands who have been troubled by this insect. "Did I think that sowing seed on the same ground two years in succession was harmful?" I answered, "From a cultural point of view, not so, if the needful Onion food was furnished; but so far as the maggot was concerned it was rather trying to court harm than endeavouring to avoid it." Still it is evident that dealing, not with a creeping insect but a winged insect, it would be very difficult to avoid it in the same garden, even when sowings took place as remote from each other yearly as is possible.

I advise in preference to sowing in the open ground in the spring at all, growing the best of our Spanish and Globe type Onions from autumn sowings, and then sowing seeds under glass early in April, growing in frames till hardened and strong, and finally planting out into the open ground thinly at the end of May. Plants so raised would be at that time as strong as any raised from seed sown in the open early in March. It is rare that plants so treated are affected by the maggot. Of course, I discriminate between the practices advised and the now common one of sowing seeds in midsummer, to give eventually, when planted out into very rich soil, large exhibition bulbs; that is another matter.

For the production of an ordinary crop of hard, well matured bulbs a sowing in shallow pans or boxes, giving several hundreds, or if need be, thousands of plants for dibbling out thinly, made early in April is certainly soon enough. So far as I have seen the maggot is always the most troublesome on light soil. That being so, ground for the reception of Onion plants in May should, after being deeply worked and manured, be well trodden, then rolled, and in that condition if dibbling be difficult it would be, no doubt, all the better for the plants in the end.—A. D.

NATURE'S HELPS TO GARDENERS.

LADYBIRDS AND THEIR LARVÆ.

As larvæ and perfect insects the ladybirds deserve our carc, for inboth conditions they revel on a diet of aphides. Fortunately the beauty of the perfect insects generally induces children and others to treat them gently. But though the beetle is well known, I am not at all certain that the larva or grub is recognised, at any rate by the gardening world, as a valuable friend. I remember once at a dinner of scientific men, supposed to know something of animal life, that during toast time, out of some flowers near me, one of these larvæ fell on the white tablecloth. I noticed our friend at once; but several were ready to give the "happy dispatch" to him, had I not interposed and begged them to "make a note" of him as one of our most useful insects. All declared they had never seen a similar creeping thing before, and yet though by no means so commonly seen as the ladybird itself, the larvæ are common enough.

Like the larva of the Lacewing fly, illustrated in the Journal of Horticulture, December 7th (page 517) the larva of the ladybird runs no risk of being mistaken for a grub, caterpillar, or maggot, as it has six legs and is quick and lively in motion. Danger, however, hangs over it, because most gardeners prefer to see their plants without any insect life upon them at all, and are apt to visit insect intrusion as a sufficient reason for death. There is, alas! in a jury of gardeners but slight prospect of "a recommendation to mercy" for any living creature when seen on a petted specimen plant; yet that is just the very place where a gardener, with knowledge of its habits of life, would place one of these larvæ if he found one wandering about. The larvæ are chiefly seen near the ends of shoots, where they know their food is to be found; often a curled up leaf is their haunt.

In colour these larvæ arc generally a blackish-grey, irregularly spotted. The head is comparatively very large, they have six legs, and the kinder

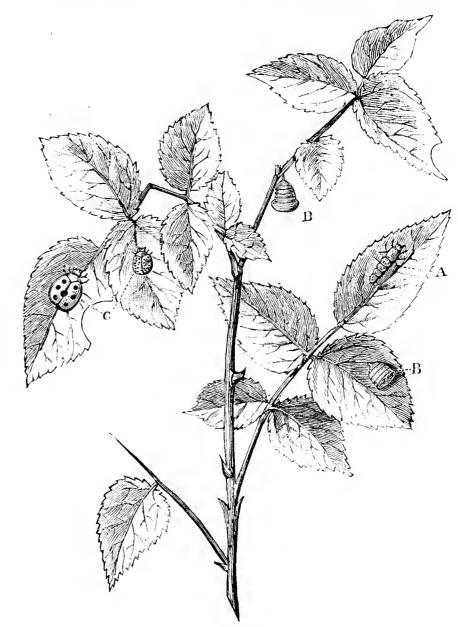

FIG. 85.-LADYBIRDS AND THEIR LARVÆ.

A, The larva or grub; BB, the pupa or chrysalis; c, the Seven-spot Lady-bird (natural size), and one of the smaller size, many-spotted.

part of the body, the abdomen, projects considerably beyond these legs. They are very active, and quickly reconnoitre the country in search of It is but right to say that some naturalists assert that some their prey. varieties of these larvæ feed on leaves of plants, but these are exceptions, and the plants they feed on are the Briony and common Heath; and, restricting themselves to this diet, they cannot be called enemies to the gardening class. The beetle commonly called ladybird or ladycow is well known in the ordinary variety, the larger seven spots and smaller two spots of black on the red wing-cases, but the sorts I have found most frequently on the Chrysanthemum are small, black with many red spots, and dull yellow, also many spotted.

The pupa or chrysalis might often be mistaken for a piece of earth or mud fastened to a leaf; it is almost a flattened g'obe with one side of the circle thus formed cut off. Sometimes we find it hanging to a leaf. By many it would be considered far from ornamental, and in removing it it would probably give way, and not till then would they think that it was some form of life. It is in this stage and that of the larva that the gardening world need to know and protect them. The larva, pupa,

and developed insects are depicted in the illustration fig. 85.

"Knowledge is power." This is a truth that touches us in every position in life. It may be a hackneyed phrase, but it is none the less true, and as far as the aphis pest is concerned, did we know how to increase these three friends of our gardens at will, we might defy the aphis hosts, rapid as is their development. As we cannot do this, let us at least learn to know these helpers when we see them, and not lessen their numbers in our ignorance.—Y. B. A. Z.

A NOTE ABOUT GLADIOLI.

APROPOS of "D., Deal's," remarks in your last number (page 551) giving his experience in the culture of these beautiful flowers, I would like to add mine. I grow only Lemoine's hybrids, both early and lately issued varieties, and have done so for the last ten years. I noticed that during the hot weather of last summer my plants flagged and stood still; the flowers that came out were poor, but after the rains came the plants grew apace, and produced some good spikes. Nevertheless, on the whole the spikes were fewer than usual, and the flowers smaller. They grew till very late in the season, and I did not complete taking up my bulbs till the beginning of December. The bulbs, however, were

the finest I have ever had, and mostly in splendid condition.

I do not know the disease referred to by Gladiolus growers, as I have never seen any fungus amongst my bulbs. I find it is important to change the bed every year, as they do best in new soil, and that a medium loam, which will hold moisture, gives better results than light warm soil. My experience is that 20° of frost continued will kill any Gladioli left in the ground without protection, but that 3 inches of spent hops, or 4 to 6 inches of hedge cuttings or Asparagus tops, or such like refuse is an efficient protection, and that bulbs planted in December or January, and thus protected, will do better than those kept out of the ground till March. I therefore do feel that "D., Deal's," experiences this winter in leaving his bulbs in the ground will, if he will give them slight protection lead him to continue the practice in future them slight protection, lead him to continue the practice in future winters.—ALEXANDER WALLACE, Colchester.

NEW MINIATURE VIOLAS.

THESE very interesting dwarf-growing Violas are fast coming to the front, and most deservedly so, and for them we are indebted to Dr. Stuart of Chirnside through his seedling miniature variety "Violetta" in the first place, and for other seedlings of the same type since introduced. We are also specially indebted to Mr. George Steel, late of Heatherslaw, and now of Etal, Cornhill-on-Tweed, for so perseveringly working with this section, and raising, so many pretty seedlings some of which will this section, and raising so many pretty seedlings, some of which will be sent out in the spring. Hitherto, Mr. Steel has cultivated a general collection of the best Violas, but he has now discarded all excepting the miniature section, so as to be able to devote more attention to this charming type, and working for rayless varieties. Having seen flowers of his various seedlings to be sent out I am able to speak confidently about them.

Of the miniature section, it will be as well to say for the guidance of those who have not grown them, that they produce an abundance of small, neatly formed flowers, generally with a strong Violet perfume; grow close to the ground, and are of compact spreading habit, and the flowers are rayless-that is, free from rays or dark markings in the centre of the flowers, the attainment of which I was the first to advocate years ago, and have persistently worked for, but we have as yet not many of the larger section of Violas entirely free from it. The following new varieties of miniatures raised by Mr. Steel will be in the hands of various florists in the spring for distribution.

Ethel Horsfall.—Delicate clouded lilac, of pretty form, and very

fragrant.

Steeli.—This, when the blooms were sent to me, I described as a miniature of miniatures; the lower petals are light yellow, the top petals cream coloured, entirely rayless, and a charming variety.

Ethel Buckley.—Deep heliotrope colour, with a deep orange eye, and

very pretty.

Pure Love.—Similar in colour to Ethel Horsfall, but smaller, and very_pretty.

Princess May.—Delicate lilac, with a yellow blotch underneath the

eye; a small, well-formed flower, very fragrant and pretty.

Beauty of Heatherslaw.—Light yellow, the lower petals a little deeper in colour, of good substance and form, and quite rayless; a charming variety.

Picco.—Creamy white with a narrow edging or border of lavender, and with a small yellow eye and distinct.

Miss Isa.—Lavender-tinted blue, distinct and pretty.

Mabel.—A pretty flower; white slightly flushed with cream, and uite rayless.—W. D.

THE APPLE BLOSSOM WEEVIL

(ANTHONOMUS POMORUM).

THIS insect very frequently causes much harm to the Apple and Pear crops, and in the last few years its injuries have much increased in fruit-producing districts, and have been often attributed to the caterpillars of the winter moth. Close examination of the blossoms, however, would show that the larvæ, or little yellow maggots, of the weevil were in the centres of the flowers, destroying their powers of fructification, though at the same time caterpillars might be feeding upon the blossoms and leaves. The action of this weevil upon the fruit blossoms of Apple and Pear trees is also mistaken for the effects of white frosts, when the petals have become brown or rust coloured; but if the blossoms are closely inspected, either the little yellow pupa of the weevil will be found in them, or a little round hole in the side of the withered flower bud will be noticed, showing that the perfected weevil has cut its way out of its cradle.

Incredible damage is often caused by this weevil in Apple and Pear orchards in France. In some Departments syndicates of defence against it have been formed ("Syndicats de défense contre l'Anthonome"), consisting of a committee in each Commune, to carry out a series of operations calculated to destroy this dangerous enemy, as it is felt that it is only by united action among cultivators that injurious insects of this and other kinds can be stamped out.

DESCRIPTION.

The Apple blossom weevil is very small, only the fourth of an inch long, and the eighth of an inch in breadth. It is reddish or chestnutbrown, with down or pubescence of a greyish hue upon its body. Occasionally specimens are found almost pitchy in colour. The wing cases have pale marks upon them below the middle. There is a conspicuous white mark, or scutellum, at the base of the wing cases. The legs are reddish; the thighs of the first (or anterior) pair are large, and furnished with a formidable tooth on each; the feet, or tarsi, are of a darker colour. The rostrum, or snout, is the most remarkable feature, being half as long as the body, slightly curved, with antennæ near its extremity furnished with oval clubs having four joints.

Like many other weevils it falls down when disturbed, tucks in its

legs and snout, and remains motionless, feigning death until the danger

has passed.

LIFE HISTORY.

In the first warm days of spring the weevils issue from their winter retreats, and find their way to the Apple and Pear trees. Some authorities consider that the females seldom use their wings, and that only the males fly freely. Others hold that both sexes fly equally well.

The female, either by flying or crawling, finds its way to the blossom

buds of Apple and Pear trees, and boring a hole either with its snout, as Curtis and others affirm, or, according to some observers, with a stylet placed at the end of its body, it places one egg within each bud, and carefully closes up the hole. A female lays from fifteen to twenty eggs, but places one only in each flower bud. The process of laying one egg takes about three-quarters of an hour. The egg is yellowish and oval. Authorities agree that oviposition in an individual female may extend over a fortnight at least. The eggs are hatched in from five to nine days.

The larva, or maggot, is without feet, and is about the third of an It is wrinkled, and white at first, gradually becoming It has a brown head, with two little brown spots on the inch long. yellowish. It lies in the bud in a curved form, and attacks the first segment. stamens and pistils, but rarely touches the ovary. It soon causes the petals to wither; the flower bud changes to a rusty hue, and decays.

The larva in from eight to ten days turns into a pupa, which is nearly a quarter of an inch long, of a yellow colour, with a long beak or rostrum, and feet folded on the under side of its body. This state lasts for about ten days, when the weevil appears, and escapes through a hole,

which it bores in the petals.

After this, the weevils live among the leaves of the fruit trees. It is not known whether they feed upon their leaves. A French savant, Dr. Henneguy, concludes from careful observation that they do not feed at all, but live upon a reserve of fat, corps graisseux, stored up in their bodies during their previous state. They are not seen after the end of September, retiring for hibernation to chinks in the bark of Pear and Apple trees, also in lichenous and mossy growths upon their branches, as well as under stones and rubbish beneath and around the trees, and in other similar refuges. They probably also pass the winter under the bark of other trees, as they have been found upon Oaks in the summer.

CIRCUMSTANCES OF THE ATTACK.

According to natural instinct, the weevils do not appear until the weather is mild and the flower buds have begun to swell. If the season is and continues warm and growing, the effects of the attack are usually of a slight character. But should the weather be cold and changeable, as is so often the case in Great Britain and the north and western parts of France, the flower buds are slowly developed, and the weevils consequently have time to lay their full complement of eggs, whose period of hatching is accomplished before the flowers are fully evolved.

Varieties of Apple trees which blossom very early and very late are more likely to escape the attacks of the weevil than those of the main

crop whose blessom comes late in May in ordinary seasons.

METHODS OF PREVENTION, AND REMEDIES.

One mode of prevention is to spray the limbs and branches of Apple trees, between October and February, with a solution of sulphate of iron, to destroy the lichens and mosses which serve as harbours for this weevil and other insects. One pound of sulphate of iron should be put to one gallon of water. This can be thrown up over the trees by means of a garden engine with a powerful pump.

Lichens and mosses upon fruit trees may be killed by throwing up freshly slaked powdered lime over the branches in damp weather in winter. This can be done by men having tin scoops, like small flour

scoops, fastened upon long poles.

All long grass, leaves, and rubbish should be cleared away underneath fruit trees on grass land, and on cultivated land it would be useful to apply lime, lime ashes, or lime and soot, and dig it in around the trees.

Assuming that Curtis, Schmidberger, and others are correct in their belief that the female weevils cannot fly, or rather do not care to exercise their power of flight, greased or tarred bands of paper put round the fruit trees would prevent their ascent.

It wou'd be well to adopt the practice of orchardists in Brittany, who

take off the rough bark of the trunks and large branches of the fruit trees with scrapers, and brush every part with stiff carpet brushes. They place cloths round the tree to catch the pieces of bark and the weevils that are dislodged; these are collected and burnt. Sometimes limewash is put on the trees after the scraping. Others apply compositions of lime and naphthaline or petroleum.

Limewashing the trees is not effective against insects unless the rough bark is cleared off, and the limewash thoroughly worked into

every cranny while it is fresh.

It is most difficult to use insecticides, and insectifuges, with advantage, as compositions that are strong enough to kill or drive away the weevils would probably injure the tender buds. After the larva is within the bud it is hopeless to attempt to reach it.

A mode of decreasing the number of weevils alopted in France consists in shaking the branches to make the insects fall on to cloths spread below. Cloths—old rick-cloths being best—are cut and arranged so as to fit close round the trunks of the trees. Labourers get into the trees and shake the branches violently, and others, with the aid of long poles with hooks at the ends, shake the branches within reach. The cloths are quickly swept with brooms, and the débris and the weevils are shovelled into sacks. This must be done rapidly, before the weevils can fly away. It is said that four men and two boys treated 110 trees in a day in this manner.

From experiments made, it has been found necessary to perform this operation two or three times on each tree, as all the weevils are not shaken off at once. From a tree, for instance, from which at the first shaking 1000 weevils had fallen, 385 were shaken off five hours later. In one orchard of 8 acres, having 347 trees, nearly 450,000 weevils were destroyed in three days, at a cost of £1. A satisfactory crop of Apples was obtained.

It should be pointed out that this operation must be carried out before the weevils have laid their eggs, and upon their first appearance,

commencing with the earliest varieties.

This mode of destroying the Apple blossom weevils might be advantageously practised in Great Britain. It might also be useful in case of attacks of winter moth and other caterpillars. It need hardly be pointed out that the fruit growers in districts should combine to wage war in this fashion simultaneously, and with care and energy.—(Board of Agriculture.)

HARDY FRUIT GARDEN.

Protecting Outdoor Fig Trees.—In all but the most favourably situated positions Fig trees require protection from the severest frosts. A ready method of insuring the safety of trees on walls is to unfasten the whole of the branches, tying them compactly together in bundles; and when severe frosts are imminent dry bracken or straw may be packed over them also, enclosing the main stem, which needs protection equally with the branches. Archangel mats nailed over all will make everything neat and tidy.

Heading Down Fruit Trees for Grafting.—Large-limbed fruit trees, which it is intended to graft in the spring with scions of better varieties, should now be headed down to points within a short distance of the junction of the branches with the main stem, leaving, however, a sufficient length to each stump so that a portion may be removed at grafting time, the bark adjoining a new cut working easier than that around an old one.

Preserving Scions for Grafting. — During the operation of pruning Apple and Pear trees well-ripened portions of the current year's wood may be selected for furnishing scions, laying them nearly the whole of their length in trenches made in a cool, shady position, where they will remain dormant until wanted. It is essential that the scions be cut before the least swelling of the buds takes place, and they are best secured in mild weather during the part for weaks.

best secured in mild weather during the next few weeks.

Hints on Winter Planting Fruit Trees.—There are many favourable opportunities when young new trees may be planted or specimens of several years' growth removed from one part of the garden to another. The best time is just when the leaves fall, but it is not always possible to accomplish the work then, and if carefully done now there is no reason why trees should not thrive afterwards. They will do so if the most important rules laid down for planting are strictly followed. The weather should be mild and comparatively dry in order that the soil may work easily without clinging tenaciously to the boots of the workman, or render his spade difficult to use. Soil in this state may be placed about the roots without fear. Its friability may be increased by mixing with it a small portion of dry wood ashes, which will favour the healing of the roots and an early commencement of root action. All broken roots must be cut smooth, and secure staking adopted along with the planting, afterwards a mulch of fairly short and dry littery manure will prevent the entry of frost. Newly planted trees ought not at the present time to be watered. The soil is moist enough in all cases, and quite sufficient for the requirements of roots in an inactive state.

Manuring Bush Fruit.—After the pruning of these is completed and the prunings cleared away, spread a coating of half-decayed farmyard manure under and between the bushes that need the dressing, lightly forking it into the ground wherever such is not occupied with roots. The soil immediately under the branches is, in well established bushes, mostly crowded with masses of fibrous roots which ought to be left undisturbed. Merely spread the manure over them, leaving it to decay, but, if desirable, it may be covered with a thin coating of soil. Gooseberry bushes that have been badly affected with caterpillars in summer ought, if practicable, to have the surface soil removed a couple of inches from under the spread of the branches, which will clear away the pupæ of caterpillars in hiding there for the winter. Such soil should be deeply buried between the bushes in the spaces free from roots, accompanied with a dressing of lime. If not convenient to remove the soil make the ground white with lime. The soil from the trench mixed with some short manure can be spread over the roots.

Dressing Fruit Trees.—Allowing insects and parasitical growths to infest fruit trees soon brings them into an enfeebled condition. Those pests which infest the branches and stems and once fairly established are always more or less in evidence if means to check them are not continually waged. Winter is the best time to carry on the work of

insect eradication.

Moss and Lichens.—To rid trees of these incrustations, lime used in conjunction with soot and sulphur is a good destroyer. In preparing a mixture of this kind add to four parts of hot lime two parts of soot and three of sulphur, mixing all together in strong soapsuds to the consistency of paint. On applying this with a brush to all affected parts of trees it will not only destroy the growths referred to, but insects concealed in the bark as well. Previously, however, the thickest of the growths should be carefully scraped off either with a wooden spatula or piece of hoop iron, being cautious not to injure the bark. The soda and potash mixture recommended on page 522 is excellent for cleansing the branches of fruit trees or bushes.

American Blight and Scale.—These insects require the use of strong and persistent measures to fully exterminate them from fruit trees. An emulsion of softsoap and petroleum at the rate of a wineglassful of the latter to a gallon of water in which 3 ozs. of softsoap has been dissolved will destroy all the insects it reaches. Combine the oil and soapy water with a force pump, applying it to the trees at a temperature of 100°. Badly infested trees ought first to be well washed with a stronger solution of softsoap, not less than 4 ozs. to the gallon, using it at the same temperature. If numerous, the scale insects should be scraped off with a blunt edged piece of wood, the trees afterwards

being brushed or syringed with the emulsion.

FRUIT FORCING.

Vines.—Earliest Forced in Pots.—The Vines started early in November in bottom heat are making rapid progress, growth having been freely produced and root action excited in consequence of the leaf development, which should be encouraged by top-dressings of artificial manures and supplies of water not less in temperature than that of the bed. The fermenting materials must not be allowed to decline in heat at this critical stage, augmenting them as required to maintain a temperature of 70° to 75° about the pots. It is a good plan to keep a heap of leaves and stable litter in reserve, from which supplies may be drawn as required. Particular attention must be given to the ventilalation, avoiding chills, such as those resulting from cold currents of air, supplying the Vines with cold water. Disbud and tie down before the shoots touch the glass, not being in too great a hurry in stopping, nor restricting to a certain number of joints beyond the banch where there is room. Yet there ought to be two, as well-developed foliage is essential to the proper swelling and finishing of the Grapes. Avoid overcrowding the foliage and overcropping by removing superfluous bunches as soon as choice can be made of the best. Maintain a night temperature of 60° to 65°, 70° to 75° by day artificially, so as to secure steady progress, and as the flowers open keep a rather drier atmosphere. Otherwise damp the paths two or three times a day, and where fermenting materials are not employed sprinkle the floors occasionally with liquid manure.

Planted-out Vines Started Early in December .- Where the house was closed at the beginning of this month the Vines will have started to grow. The temperature should be gradually raised so as to have it 60° to 65° at night when they come into leaf, 70° to 75° by day in mild weather, but 65° is more suitable when the weather is dull and cold. Air must be given judiciously, as cold currents cripple the foliage irreparably, yet moderate ventilation is essential to sturdy growth and well-developed leaves. As the foliage enlarges root action will be promoted, and it should be accelerated by supplying top-dressings of phosphatic manure, as bone superphosphate, say 4 ozs. per square yard. Defer disbudding until the bunches show in the points of the shoots, and allow these to grow up towards the glass. The growths also should be allowed to make two joints at least beyond the show of fruit before stopping, pinching off the points when the leaves at the stopping point are about the size of a halfpenny, removing laterals at the same time. Supply water when needed to the inside border at a temperature of 5° higher than the mean of the house. If the roots are partly outside, the border must be effectively protected from frost, and where they are entirely outside fermenting materials will materially assist root action and a steady supply of nutrition, but once used they must be added to from time to time to maintain the heat uniform at a temperature of 70° to 75° at the surface of the soil. This may be ascertained by plunging a thermometer with the bulb level with the base of the

fermenting material. Damp the paths and borders two or three times a day, sprinkling the Vines occasionally, but avoid excessive syringing or a confined moist atmosphere, as it only favours aërial roots from the

rods to the prejudice of proper root activity.

Houses to Afford Ripe Grapes in June—The Vines that are to supply these tshould be started at once. If the Vines are planted inside, the outside borders should be protected with a thickness of leaves sufficient to exclude frost; but the Vines being planted outside, the border will be advantageously covered with fermenting material, two parts leaves and one part stable manure, both as fresh as possible, mixed, and put on so as to maintain a temperature at their base of 60° to 65°, and 70° to 75° when the Vines start into growth. Supply the inside border with water at a temperature of 60° to 65°, bringing it into an evenly moist but not saturated condition. Fuel may be economised by the free use of fermenting materials placed inside the house, turning a portion of them daily, and adding fresh as needed, so as to maintain a genial warmth, and the giving off of ammonia-charged moisture. This will also lessen the necessity for damping; otherwise, damp the house and Vines two or three times a day when the weather is bright. In dull weather sprinkling the floor once or twice a day will be ample. The temperature should be 50° to 55° by artificial means and 65° from sun Yourg Vines or canes will need depressing to the horizontal line or lower, to insure their breaking regularly to the base.

Houses from which the Grapes Have been Cut.—The Vines should be pruned as soon as possible, as when this is deferred beyond the turn of the days bleeding is more or less liable to follow, but to a plump bud or eye as near to the main stem as practicable. Vines in good condition will give fruit enough when pruned to one bud; but where this has not been the case, or the bunches were too small in previous years, the bearing shoots (called laterals) may be shortened to two buds, or left longer if those are not round and plump. This will cause the spurs to become long in course of time, but it is easy to encourage growth from the base and cut the old spurs away, or train up young canes for the displacement of the old rods. All loose bark should be stripped off, especially on the spurs, no attempt at scraping being made, and the Vines washed with tepid softsoap and water (3 ozs. softsoap to a gallon of water). This is all that is necessary if the Vines are clean, otherwise follow with an approved insecticide. Cleanse the house thoroughly. Limewash the walls, adding a handful of flowers of sulphur to each pailful of limewash. Remove the loose surface soil or remains of mulchings, and supply fresh turfy loam, and sprinkle over it 4 to 8 ozs. per square yard of this mixture:—Three parts steamed bonemeal, two parts sulphate of potash, and one part ground gypsum, mixed. The house should be kept cool, but if utilised for plants the temperature artificially should not exceed 45°, as the Vines will be excited in a mean temperature of 50°, and that is fatal to complete rest. Plants only that require safety from frost should be placed in vineries when the Vines

Late Houses.—A temperature of 45°, with a dry atmosphere, should be maintained in houses where Grapes are hanging. assist in securing an equable temperature to cover the roof with mats or straw secured with tarred string. Some keep the Grapes in this way on the Vines until March, but due provision is made for ventilation, it being important to prevent the deposition of moisture on the berries, for that causes the germination of the spot fungus spores, or its near ally, the ripe rot fungus, and the berries speedily decay. The shade also prevents black Grapes losing colour nearly so rapidly as those exposed to strong light, and they do not lose weight to anything like the same extent. Examine every bunch carefully and frequently, removing all decayed berries. Ventilate the house on fine mornings, and keep it closed with a little warmth in the pipes when the weather is damp.

The better plan is to cut the Grapes, especially where they were ripened comparatively early, placing the ends of the stems in bottles of clear rain water secured in an inclined position so as to admit of the fruit hanging clear of the bottles. Any dry room free from dust, and where an equable temperature of 40° to 45° is maintained, will be a suitable place. This will admit of the Vines being pruned and the house cleaned. The Vines then have about a couple of months' complete rest before it is necessary to start them again.

APIARIAN NOTES.

BEES IN 1893.

THE closing year has been much talked about as an extraordinary one for honey. There was, however, not a single day throughout the whole year during which hives rose in weight more than from 4 to 6 lbs. daily. I have known them rise in weight 10 lbs. daily for a week, and extra strong hives gather from 14 lbs. up till 33 lbs. in one day. In all the records there is not an instance of any hive reaching the weight many did in 1863, and in some subsequent years. Some of my hives have never ceased breeding since August, and in most cases I see from their movements that water gathering has commenced for another year. One peculiar instance of the season is that bees hereabouts

never had an opportunity of gathering anything from Ivy. It used to flower with us in November, but this year very little was in bloom.

COMB BUILDING.

I have a number of queries to answer, but as the information will be embodied in "Hints for Beginners," I will defer them till the New Year. "C. R.," however, has one, among other questions, "Why bees refuse to build combs during the season." Although I have never written a special article on the subject, I have from time to time advised bee-keepers how to manage their stock to meet the difficulty, and to prevent swarming before the hives are filled. I cannot tell the reason bees will not build combs, but prefer swarming from a half or two-thirds full hive, though I may tell your readers that had my instructions been carried out disappointment on that line would not have happened. The following is a repetition of past instructions. Every colony intended as a stock should have its hive filled with combs during September or This prevents premature swarming if the queen is October. youthful and prolific, and an excess of drone comb. Of course it is understood that a full-combed hive can only be satisfactory with the Lanarkshire ventilating floor. Where that is absent the amount of decay in the combs is sometimes great, and is eaten out by the bees, when invariably drone combs are substituted, constituting a double loss to the bee-keeper. I have repeatedly removed brood combs during the months of June and July, substituting a frame having a narrow starter of foundation only, and in a year hence these frames remained empty. Although the seasons were good and supers were filled, yet the bees did all that, and swarmed without building the combs in the brood nest. It is stated Carniolans were the neglectful in "C. R.'s" case, but in my own experience other varieties were as guilty; but why they in some instances refuse to work combs in the places most essential to the bees' well-being is beyond my comprehension.

SPREADING BROOD.

This is another question. "A. M.," who has followed the advice given by other writers in the way of spreading brood, now finds his hives full of chilled brood, having failed to store surplus honey during the summer. He is afraid of foul brood, and asks my advice. I have from the first warned bee-keepers of the questionable practice as advised by inexperienced writers. Bee-keepers who prefer to throw aside the good old Scottish methods of managing bees, following the advice of book-learned bee-keepers, must just take the consequences. The pages of the Journal of Horticulture are open to all who care to give or ask for information, and those who depend upon it will neither have chilled brood nor foul brood in their hives, at least beyond an infected case.-A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

To Correspondents.—As, in consequence of the Christmas holidays, our offices were closed from Saturday to Wednesday, only those communications for which space was reserved could be inserted on Wednesday morning; also letters of inquiry which arrived after Saturday last cannot be answered this week.

Tuberoses to Flower in August (Reader).—Pot the bulbs early in March, and plunge in ashes in a cold frame. Placing a single strong bulb in each 5-inch or slightly larger pot is preferable to starting them in smaller pots, and shifting from these into larger ones. Use a rather rich loamy soil, and pot firmly, only about three-parts burying the bulb. Keep them in cold frames or pits, some being placed in the open air to afford a good succession. All may not flower, but the bulk will produce much stronger stems than will those grown in heat. Syringe frequently

Leeks, bunch Lettuce, dozen

Ficus elastica, cach ...

Mushrooms, punnet ... 0 9

in order to keep down red spider, give liquid manure when the pots are well filled with roots, support the flower stems with stakes, and the result will most probably exceed your expectations. Should, however, they fail to expand early enough forward by means of gentle heat, the

plants being given a light position.

White Antirrhinum (Reader).—Your pan of well rooted cuttings should be kept in a cool pit or frame for another six weeks, when they ought to be placed thinly or not less than 3 inches asunder each way in a box containing some loamy compost. Keep them under glass till well rooted and growing strongly, when they should be hardened off and planted where they are to flower next summer, the early part of May being a good time to do this. If you have kept the variety well away from any other Antirrhinum and saved seed, the plants resulting from this will almost probably closely resemble the parent plant. The seed being sown very early in the year, and the seedlings kept growing vigourously, they will flower freely next summer and autumn.

Apple Gascoigne's Seedling (H. F. B.).—You are quite right in assuming that "there are three Gascoigne's Seedling Apples described in 'British Apples,' as having been exhibited at the National Apple Congress, held in gardens of the Royal Horticultural Society some years ago." The one illustrated (fig. 86) is the best of them, and our description of the Apple is as follows:—Fruit roundish ovate, very prominently ribbed towards the eye. Skir lemon coloured when ripe, marked on the side next the sun with a crimson flush, and broken streaks of the

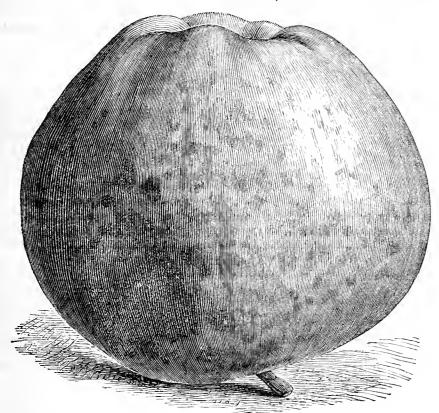

FIG. 86.—APPLE GASCOIGNE'S SEEDLING.

same colour; the base has a greenish-grey tinge and covered with a coat of thin russet. Eye closed, with incurved convergent segments set in a deep angular basin. Stamens basal: tube conical. Stalk upwards of an inch long, inserted in a deep funnel-shaped cavity. Flesh white, crisp, juicy, and briskly flavoured, with a pleasant aroma. Cells obovate, axile, or somewhat abaxile. Is a very handsome Apple indeed,

and may be used for dessert or culinary purposes.

Winter Condition of Black Fly (C. W.). — The black aphis (A. cerasi) lives through the winter on the young growths of Cherry trees under favouring climatic conditions, or in glass houses, and sometimes in warm situations outdoors. These continue to increase parthenogenetically under such circumstances for a number of years. This process of reproduction by gemmation or budding is distinct from that by eggs. These eggs consist of the outer wall or vitelline membrane, which is practically weather-proof, the yolk or vitellus, the germ vesicle, and germ spot. All these parts are easily determined anatomically, but it is extremely difficult to refer the egg under examination to the species. The eggs you have sent appear to be those of the Cherry or black aphis, the nucleus being well developed and spreading, so that they will presently become dark brown or black, and in due course the outer wall or shell will crack at the germ spot, and the virgin aphides emerge. The eggs (true) are produced by winged females at the end of the summer or n autumn, generally pale or yellow at first, but ultimately turning black.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (Amateur). — Coprosma Baueriana variegata. (L. P. B.).—Cuphea platycentra. (Yorks).—1, Daphne indica; 2, Cyperus alternifolius. (C. H.).—1, Begonia Ingrami; 2, B. manicata. (Suburban).—

SOME LESSONS OF THE YEAR.

THE year draws to a close; its span of time will soon be complete; in a few days it will be numbered with the past; but its lessons-clear, incisive, and unmistakeable-will remain with us, and of all things which the old year leaves behind they will prove the most valuable if their meaning is fully graspedtheir teaching applied to the correction of specific faults, to the improvement of practice in farm management generally.

Failures-those dear-bought lessons of adversity which, taken aright, are stepping stones to success, have sprung primarily from two causes-imperfect autumn tillage and

poverty of soil; secondarily from drought. We say this plainly, with a distinct comprehension of the general opinion that drought, and drought only, was the cause of crop failure in hay, corn, and roots. But close observation on our long journeys, the inspection of many farms in different parts of the country, and the results of our own practice has shown that the effect of the drought was very much in proportion to the condition of the land. Of corn crops, Wheat sown early on good sound land was entirely satisfactory in ear, the only effect of the drought being visible in a certain dwarfing of straw growth. Late-sown Wheat on poor land was, on the contrary, a decidedly inferior crop. Where the land was clean and ridged in autumn the sowing of spring corn was, as usual, done early, and done well. The fine seed bed gave a full even plant, the manure drilled in with the seed gave vigorous growth, which had such a good and early start that Oats were a magnificent crop, decidedly superior to the best of the Barleys.

Compare this, as we have done repeatedly, with spring corn sown on poor land, ploughed late in spring under great difficulties, in so rough a seed bed that the plant was most uneven, some coming up so long before the other that, as harvest time drew on, there were patches of ripe and green corn all over the fields. Worse than this, much of it found so little sustenance in the poverty stricken soil that it dwindled and died. Many a corn field have we seen the miserable growth of whichunworthy to be termed a crop-ought never to have been left to ripen, but should have been folded off with sheep in its green state.

Root crops were affected very much in the same way. With the drought setting in so early in March, it was evident that special treatment was an imperative necessity if we would have a useful crop There was the land ridged the proper width in autumn for Mangolds and early Swedes, so it was left till the end of March; then the farmyard manure was carted directly from the heap to the furrows, where a double amount of it was used to make certain that the plant should have plenty of moisture, the ridges being split, and the seed sown at once, only as much dung being carted daily as was required for that day's sowing. By this method the seed (sown deeper than usual) had sufficient soil moisture to induce speedy germination, the plant became quickly established in the mass of rich moist humus, and passed through the drought with comparative impunity. Where, on the other hand, the ploughing was done late, only a mere scattering of manure being placed in the furrows and no special effort made to meet the emergency, there was a lamentable failure of plant and a proportionate shortness of crop.

Poor pasture was practically bare all the summer. Live stock suffered accordingly, and lean cattle were forced on the market in such large numbers that prices were ruinously low. On such land the hay crop is never a full one. This year it was less than usual by five-sixths. For example a grazier who last year made 60 tons of hay, this year had only 10 tons from the same area. Of course he and his neighbours are loud in complaints; would that they could be made to see the folly of their negligence of the land for which they pay rent and get such miserable crops from. With land in good heart, with fertility well sustained, and the annual dressing of pure chemical manure applied in February, there was growth early and strong, a good crop of hay, and it was only during the weeks of extreme heat that the herbage ran short, to come again with full vigour when the rain did come.

Never was there a summer in which the quick action of that king of nitrogenous manures, nitrate of soda, was so useful. A supply of it was kept in readiness, and advantage was taken of the first steady downpour of rain to give a dressing of about 12 cwt. to the acre on pasture becoming bare. The effect was almost magical, so quickly and strongly did growth follow. Green Maize, too, must have notice for its splendid growth and high value. Mention of it is a reminder of the outspoken opinion of dairy farmers of land all in pasture, that mixed farming is safe farming; that their difficulties would have been much less if they could have had some green crops

Earnestly do we hope that these and other lessons of the year may lead to better practice, that their teaching may be applied, that they may carry conviction into the mind of every farmer, and lead to improvements which are so possible and so much to be desired. Under judicious change we believe entirely in the possibility of a prosperous future for agriculture in this country, but it is a matter that must be considered with an open mind; prejudice and the blind following of custom must yield to the dictates of good sense. When we hear of conferences for the discussion of help from within, of thorough cultivation of the land, of a general improvement in breeding and feeding live stock, of a common standard of excellence for all land worthy of cultivation, of sustained fertility of soil, of a thorough knowledge of the comparative value and right use of manures, of the disposal of farm produce in the most profitable manner, and of a system of cropping and farm management adapted to requirements of the times, then, indeed, shall we believe that farmers

"Rise to higher things On stepping stones of their dead selves."

WORK ON THE HOME FARM.

On those estates where the horses of the home farm are used for the clearance of timber or underwood advantage should be taken of all open weather now for the carting, every effort being made to get through with such work before spring. The carting of gravel for repairing farm roads or carriage drives must also have attention, and if the gravel pit is upon the estate see that there is a sound and easy road out of it. have had such roads of an easy gradient, but we have one now up which no horse can draw a full load, and which, when the estate came under our control, had deep wheel tracks, showing that no care had been taken to keep it in repair or to improve it. The carters either went off with half a load or horses had to undergo much brutality. A sound road and a horse in trace harness at the pit set matters right.

Draining is now being got on with on land where many patches of Rushes clearly indicated the presence of superfluous water. This pasture has also much Carnation Grass and other poor herbage, and we must have the draining finished in good time for a dressing of chemical manure in February. A renovating mixture of strong growing grasses will be sown, the superfluous soil from the drain spread over the pasture, and the whole well rolled and bush-harrowed in due course. Pasture generally is wonderfully firm to the foot for this season of the year, and sheep folds are in full use upon as much of it as possible. We like a large flock; it enables us to keep down manure bills, sheep folding being used everywhere that it can be managed. Herein lies the special value of sheep, which gives them an advantage over all other stock, and renders them indispensable to the farmer. Avoid folding pregnant ewes on arable land; never forget the heavy losses which have followed carelessness in this matter, both from the strain made upon them in walking about in the sea of mud to which the soil in such folds is often reduced at this season of the year, but also from the chilling effects of the consumption of large numbers of frosty Turnips.
